ORTHODOX REGISTRATION.

TO THE EDITOR OF THE MEDICAL TIMES AND GAZETTE.

SIR,—One of the very small minority, on whose opinions at the late meeting of the Midland Counties Medical Registration Society, you have this week commented, I plead opportunity for explanatory remarks:—

The avowed principal object of the Society, as stated in the first resolution passed at its first meeting, is "to assist the Registrar in securing a complete Registration of duly-qualified Practitioners." After having thus constituted itself for the purpose of carrying out an Act of Parliament, the provisions of which, in the matter of Registration, are clear and unequivocal; the Society determined by its second resolution, to set those provisions at naught in the case of non-orthodox, however strictly legal, Practitioners. To my inquiry, one of the leaders of the movement replied that it was not easy to define orthodoxy, though it was quite easy to understand it; therefore, he should vote for the exclusion of the non-orthodox. The Honorary Secretary then read part of a letter from the Secretary of the London Medical Registration Society, urging the advisability of excluding the homeopaths by some means or other, a purpose which he thought might be usefully served by the word "orthodox."

I confessed myself unable to appreciate the logic, the legality, or the dignity of such a line of policy.

Homeopaths, if legally qualified, can command Registration, if opposed, by appeal to the Superior Law Courts. Even to seem to contest their right under such circumstances, can only tend to increase the number of martyrs, already inconveniently numerous.

Why quibble with words and fence with the Law? Truth and philosophy can scarcely be honoured by such warfare.

I am, &c.

SAMPSON GAMGEE,

Surgeon to the Queen's Hospital.

18, Broad-street, Birmingham, Sept. 19, 1859.

REVIVALISM v. CHOREA, OR HYSTERIA.

TO THE EDITOR OF THE MEDICAL TIMES AND GAZETTE.

SIR,—In one of the leading articles contained in your extensively circulated Journal of the 17th inst. I regret to perceive you have ventured to declare that the wonderful religious awakening now going on in the North of Ireland, "is really no imposture at all, but a real mental malady." Had you, Sir, stated that in some, and that only a small number of cases, certain physical symptoms of a character resembling hysteria had manifested themselves, no one would have objected to the truth of such an assertion; but to declare that the whole of the phenomena witnessed in all the cases of religious awakening now occurring there are purely and simply "different phases of religious hysteria," appears to me to be as unreasonable as to assert, because many cases of chorea coincide with affections of the heart and spinal tenderness, that, therefore, chorea is a phase only of heart disease, or of spinal irritation, whereas we know it may exist without either of them. It is a fact well-known to all who have witnessed the scenes now occurring in those parts of Ireland, that by far the larger number of cases of conversion are unattended by these physical manifestations—cases in which an entire change of heart and purpose of life are as great and

distinct, but not more so than in others in which such symptoms have also been for a short time exhibited. Now if one uniform result ensue in all the cases, whether accompanied or not with the aforesaid symptoms, who shall pronounce it in the one set of cases only "an actual and real mental malady," and in the other set of cases acknowledge with joy and gratitude the wonder-working finger of God?

Recognise if you will—nay, more, carefully study—the physical, but do not deny the existence of the higher, viz. the spiritual—the former very evanescent, and seen only in some cases—the latter, permanent, unvariable, and changing the whole character of the individual, and not at all necessarily co-existing with him. Were this the proper place to do so, I could easily show that the spiritual manifestations are only such exhibitions of Divine power, judging them by their fruits, as the Christian church is fully warranted to expect, and for which many sober-minded, devout Christians are now, and have been long praying.

Trusting, Sir, you will candidly let this side of the question obtain a hearing in your columns if space permits.

I am, &c.,

T. A. HENDERSON, M.D., L.R.C.P. Lond.

9, Nelson-crescent, Ramsgate, September 26, 1859.

[We are delighted to find that our correspondent has a firm belief that the revival movement is truly a religious movement. Every Christian must desire to see the operations of Christianity widely spreading around him, and we sincerely trust that what our correspondent calls "change of heart and purpose of life," may prove a permanent fact, and not a mere spasmodic effervescence of the minds of the "revived." Our correspondent should, however (as he is able) give us some proofs of the assertions he makes. What we stated we stated on high authority—on the authority of a Dignitary of the Church, who had visited Belfast for the very object of making himself acquainted with the real character of the movement. Archdeacon Stopford believes what we stated, that hysteria was the chief agent producing these manifestations, and if our correspondent will read the letters of the Special Times Correspondent, lately published on the subject, he will find from that unanswerable and cool-headed authority, that there is no great appearance of any religious enthusiasm, excepting among the "raving" instances. Our correspondent must also remember, that in all ages of the world there have existed, at various periods, Religious Effervescences, which have all had the character of enthusiasm and exaggeration, rather than of a sane and sensible religious improvement of life. He must, therefore, excuse us in being cautious how we receive all these tidings. As a specimen of the turn these revivals are taking, we give the following extract from the *Armagh Journal*. It is there given by way of caution to Medical Students and other light-hearted people:—

"A Mocker's END.—Within about three miles of Cootehill there lived a young man, who had been studying for the Medical Profession, and who, of late, frequently made it his business to rail at and mimic the revival movement. He was thus employed on Wednesday—most profanely imitating the gestures and expressions of some of the stricken ones. On the same night he was taken suddenly and alarmingly ill, and continued to suffer the most agonising pain till the following Friday. During that interval he was never once heard to pray for mercy, till, with his expiring breath, he wildly exclaimed, 'O Lord! Lord!' and passed into the presence of his Judge.]"

COMMUNICATIONS have been received from:—

Professor SIMPSON; Dr. CONOLLY; Dr. ROBERT LEE; Dr. PRIESTLEY; Dr. J. ROBERTSON, Edinburgh; Dr. WILKS; Mr. PITTARD; Mr. MILLARD; Mr. SPRATLY; Mr. POWELL; Dr. YOUNG, Edinburgh; Dr. CRISP; Mr. TUCKER; Mr. TUSON; Mr. H. T. KEMPTON; Mr. F. JONES; Mr. J. ROBERTSON; MYOPIA; Dr. MARKHAM; INVESTIGATOR; A CONSTANT READER; M.D.; Dr. W. STEER RIDING; Dr. J. D. GILLESPIE; and W. D. G.

APPOINTMENTS FOR THE WEEK.

October 1. Saturday (this day).

Operations at St. Bartholomew's, 1½ p.m.; St. Thomas's, 1 p.m. King's, 2 p.m.; Charing-Cross, 1 p.m.

3. Monday.

Operations at the Royal Free Hospital, 1 p.m.; Metropolitan Free Hospital, 2 p.m.

4. Tuesday.

Operations at Guy's, 1 p.m.; Westminster, 2 p.m.

5. Wednesday.

Operations at University College Hospital, 2 p.m.; St. Mary's, 1 p.m. Orthopaedic Hospital, 2 p.m.; Middlesex, 12½ p.m.

HUNTERIAN SOCIETY, 8 p.m. Dr. Peacock "On the recently-prevalent Remittent Affections." Council Meeting at 7½.

OBSTETRICAL SOCIETY OF LONDON, 8 p.m. Dr. Graily Hewitt "On the Hydatidiform or Vesicular Mole; its Nature and Mode of Origin."

6. Thursday.

Operations at St. George's, 1 p.m.; Central London Ophthalmic, 1 p.m. London, 1½ p.m.; Great Northern, 2½ p.m.

7. Friday.

Operations, Westminster Ophthalmic, 1½ p.m.

Grosvenor Place School of Medicine,

No. 1, GROSVENOR PLACE (Adjoining St. George's Hospital).
WINTER SESSION, 1859-60.
LECTURES.

The INTRODUCTORY LECTURE will be delivered on MONDAY, OCTOBER 3rd, at Three o'clock, p.m., by Dr. COCKLE.

General Anatomy and Physiology—Dr. Richardson.
Descriptive and Surgical Anatomy—Dr. Halford and Mr. Lawson.
Practical Anatomy—Mr. Pittard.
Chemistry—Dr. Thudichum.

Principles and Practice of Medicine—Drs. Cockle and Leared.
Principles and Practice of Surgery—Mr. Spencer Wells & Mr. Adams.

FEES.—General Fee to all the Lectures required by the Universities of London and St. Andrews, the Royal College of Surgeons of England, and the Society of Apothecaries, 35 Guineas.

Special arrangements may be made for any one of the Examining Boards.

Prizes and Honorary Certificates will be awarded for general proficiency at the termination of the Session.

The Microscope is used to illustrate the Lectures and Demonstrations. The Dissecting Room and Museum of Anatomy are open to the Students during day-light, where their Studies are superintended by the Lecturers on Anatomy and Mr. Pittard.

The Lecturer on Chemistry has a Private Laboratory, where Students are instructed in Analytical and Physiological Chemistry.

Instruction in Pathological Anatomy is given by the Lecturer on Physiology.

Further information may be obtained at the School, 1, Grosvenor-place; or Dr. Richardson, 12, Hinde-street, Manchester-square, W.; or at the Residences of the different Lecturers.

Westminster Hospital School of

MEDICINE.—The INTRODUCTORY ADDRESS of the Session 1859-60 will be delivered by Dr. RUSSELL REYNOLDS, on MONDAY, the 3rd of October, at 8 p.m.; and after the Address a CONVERSAZIONE will be held, and the PRIZES of the past Session distributed.

The Westminster Hospital was Instituted A.D. 1719, and Incorporated by Act of Parliament A.D. 1836. It contains 175 Beds, and affords relief to about 20,000 Out-patients annually.

HOSPITAL PRACTICE.

Physicians—Dr. Basham, Dr. Fincham, Dr. Radcliffe.
Assistant-Physicians—Dr. Marcet, Dr. Reynolds.
Surgeons—Mr. Barnard Holt, Mr. Brooke, Mr. Holthouse.
Assistant-Surgeons—Mr. Hillman, Mr. Power.
Surgeon-Dentist—Mr. Clendon.

LECTURES.

Descriptive and Surgical Anatomy—Mr. Holthouse.
Practical Anatomy—Mr. Heath and Mr. Gray.
Dental Surgery—Mr. Clendon.
Chemistry—Dr. Marcet, F.R.S.
Surgery—Mr. Barnard Holt, and Mr. Brooke, M.A. F.R.S.
Physiology and Physiological Anatomy—Mr. Power.
Medicine—Dr. Basham.
Botany—Mr. Syme, F.L.S.
Comparative Anatomy and Zoology—Mr. Power.
Natural Philosophy—Mr. Brooke, M.A. F.R.S.
Materia Medica and Therapeutics—Dr. Radcliffe.
Forensic Medicine—Dr. Fincham and Dr. Reynolds.
Practical Chemistry—Dr. Marcet, F.R.S.
Midwifery—Dr. Frederic Bird.

Clinical Lectures.—In addition to the instruction given by all the Medical Officers during their visits, Courses of Lectures on Clinical Medicine and Surgery, in accordance with the new regulations of the Examining Boards, will be delivered during the Winter and Summer Terms by the Physicians and Surgeons.

Clinical Assistants, Physicians' Clerks, and Surgeons' Dressers, are selected from the most qualified Students, without additional Fee.

The Entire Course of Study (including Hospital Practice and Lectures) required by the College of Surgeons and the Society of Apothecaries, may be attended on payment of Seventy Guineas.

Further information may be obtained on application to

F. J. WILSON, Secretary to the Hospital.

University College, London.—Faculty

OF MEDICINE.—The SESSION 1859-60 will open on MONDAY the 3rd October. At 3 o'clock, p.m. a Meeting will be held for the Presentation to Students of the Faculty, of the Medals and Certificates of Honour awarded at the Class Examinations for the Winter and Summer Terms of the last Session. At 8 o'clock p.m. the Professors of the Faculty will receive the Students and their friends at a Conversazione, in the General Library and New Museum of the College. Gentlemen who may be disposed to favour the Professors with their company, are requested, if they have not received invitations, to leave their names and addresses in the office of the College, under cover to the Dean, in order that cards may be sent to them.

The Lectures to the Classes of the Winter Term will commence as follows:—

On TUESDAY, October 4.

Anatomy—Professor Ellis, at 9 o'clock, a.m.
Anatomy and Physiology—Professor Sharpey, M.D., at 10 a.m.
Chemistry—Professor Williamson, at 11 a.m.
Comparative Anatomy—Professor Grant, M.D., at 3 p.m.
Surgery—Professor Erichsen, at 4 p.m.
The Principles and Practice of Medicine—Professor Walshe, M.D., at 5 p.m.

On MONDAY, October 17.

Practical Physiology and Histology—Dr. Harley, F.C.S., at 4 p.m.
In January—Dental Surgery—Mr. G. A. Ibbetson, at 6 p.m.
Hospital Practice daily throughout the year with Clinical Lectures by the Physicians and Surgeons, also Lectures on Ophthalmic cases.

Prospectuses may be obtained at the Office of the College.

A. W. WILLIAMSON, Dean of the Faculty.
CHAS. C. ATKINSON, Secretary to the Council.

September 20, 1859.

St. Mary's Hospital Medical School.—

The WINTER SESSION will commence on MONDAY, October 3rd, at Eight o'clock p.m., with an INTRODUCTORY ADDRESS by Mr. URE, after which a CONVERSAZIONE will be held in the Museum.

It is a distinctive characteristic of St. Mary's Hospital that the following Medical Appointments are annually conferred upon the Pupils free of every expense. The advantages of FIVE of THESE APPOINTMENTS far exceed in money value as many SCHOLARSHIPS of Fifty Pounds each. There are four Resident Medical Officers who board (free of all expense) in the Hospital, three of whom are appointed for twelve months, and one (the Obstetric Officer) who is appointed for six months; four Non-Resident Medical Officers; a Medical and a Surgical Registrar; all of whom are appointed by the Weekly Board of Governors on the recommendation of the Medical Committee. Clinical Clerks and Dressers are selected from the best qualified Students. All the above offices are awarded after competition among the qualified Perpetual Pupils of the Hospital.

Physicians—Drs. Alderson, Chambers, Sibson, H. Jones, Sieveking, and Markham. Surgeons—Messrs. Coulson, Lane, Ure, Spencer Smith, Walton, and J. Lane. Physician-Accoucheur—Dr. Tyler Smith. Ophthalmic Surgeon—Mr. White Cooper. Aural Surgeon—Mr. Toynbee. Surgeon-Dentist—Mr. Sercombe.

Further information may be obtained on application to the Dean of the School, who will also furnish the names of Gentlemen in practice in the vicinity of the Hospital willing to receive Pupils to reside with them.

SPENCER SMITH, Dean of the School.

St. Mary's Hospital, August, 1859.

St. George's Hospital Medical School.

SESSION 1859-60.—The WINTER COURSE of INSTRUCTION will commence on SATURDAY, October 1st, with an INTRODUCTORY ADDRESS by Mr. H. C. JOHNSON, at 2 p.m., at the Hospital.

Physicians—Dr. Page, Dr. Bence Jones, F.R.S., Dr. Pitman, and Dr. Fuller. Assistant-Physicians—Dr. Barclay and Dr. John W. Ogle.

Obstetric Physician—Dr. Robert Lee, F.R.S.

Surgeons—Mr. Caesar Hawkins, F.R.S., Mr. Cutler, Mr. Tatum, and Mr. H. C. Johnson.

Assistant-Surgeons—Mr. Prescott Hewett and Mr. George D. Pollock.

Dentist—Mr. Vasey.

Lecturers—Medicine—Dr. Pitman.

" Surgery—Mr. Tatum.

" Anatomy—Mr. Pollock and Mr. Gray.

" Physiology—Mr. A. Johnson.

" Chymistry—Dr. H. M. Noad.

The Hospital contains 350 beds.

Clinical Lectures are given by the Physicians and Surgeons of the Hospital during the Winter and Summer Sessions, and Clinical Instruction is given in the Wards by the Physicians and Surgeons, and on the Diseases peculiar to Women by the Obstetric Physician.

A Maternity Department, for the delivery of married lying-in women at their own homes, is established at the Hospital, under the superintendence of the Obstetric Physician.

The Surgeons' Perpetual Pupils are eligible to be Assistant House-Surgeon for Six Months, and House-Surgeon for Twelve Months (without additional Fee), when properly qualified for the office. Pupils of the Hospital are eligible to the office of Obstetric-Assistant, when duly qualified, at a salary of £100 per annum.

Pupils entering to St. George's Hospital Medical School are free to all Lectures and Hospital Practice necessary for the Examination of the College of Surgeons and Society of Apothecaries, by the payment of FORTY GUINEAS the first year, FORTY GUINEAS the second year, and TWELVE GUINEAS the third year. But Pupils have the option of entering to the different courses of Lectures and Hospital Practice by separate payments.

EXHIBITIONS AND PRIZES.

"The William Brown Exhibition," of Forty Pounds per Annum, tenable for Three Years, may be held by any Pupil, perpetual to the Medical or Surgical Practice, who has commenced his third, but not completed his fourth Winter Session. Pupils entering to the Hospital Medical School in the Session 1859-60 will be entitled to compete for this Exhibition.

A Prize of Twenty Guineas, for general proficiency in Medical Studies, will be offered to Students who enter to the Hospital Medical School for the Session 1859-60. The Examination will take place in July.

Also, for the encouragement of Clinical Study—

A Prize of Twenty Guineas, for Surgeons' Pupils in their second year; a Prize of Twenty Guineas, for Physicians' Pupils in their second year; Sir Benjamin Brodie's Clinical Prize in Surgery; the Thompson Medal; the Lewis Powell Clinical Prize in Medicine; and Sir Charles Clarke's Prize for Good Conduct.

Further information may be obtained from Mr. Pollock, the Treasurer of the School; from any of the Lecturers; or from Mr. Hammerton, the Apothecary of the Hospital.

Anderson's University, Glasgow.—

The MEDICAL SESSION begins on TUESDAY, NOVEMBER 1st.

Anatomy and Practical Anatomy, by Drs. M. S. and George Buchanan.

Chemistry and Practical Chemistry, by Dr. Penny.

Materia Medica, by Dr. Morton.

Institutes of Medicine, by Dr. E. Watson.

Surgery, by Dr. Hunter.

Midwifery, by Dr. Paterson.

Practice of Medicine, by Dr. Anderson.

Military Surgery, by Dr. McLeod.

In SUMMER—Botany, by Dr. Bell; Medical Jurisprudence, by Dr. Cowan. Fee for each Class, £2 2s. The Fees for the Lectures and particulars may Diploma amount to £30. A Syllabus of the Lectures and particulars may be obtained from

ANDREW ANDERSON, M.D., Secretary.

Dr. E. E. Barron has resumed his

MEDICAL and SURGICAL TUITION adapted to Students and Practitioners preparing for PROFESSIONAL EXAMINATIONS, and will commence a Winter Course on October 4. One or two gentlemen received as HOUSE-PUPILS.

15, St. Thomas's-street, Borough, S.E.

The Middlesex Hospital, Session

1859-60.—The Session opens on MONDAY, October 3rd, with an Introductory Address by Mr. HENRY, at Eight o'clock, p.m.

The Hospital, from recent enlargements, contains upwards of 300 beds, of which 185 are for Surgical and 120 for Medical cases. The Cancer Establishment receives 33 patients. Wards are specially appropriated to cases of Uterine Disease and of Syphilis. 2100 in-patients were admitted during the past year; the number of out-patients during the same period amounted to 16,469.

MEDICAL OFFICERS.—Dr. Stewart, Dr. Goodfellow, Dr. H. Thompson, Dr. Frere, Dr. F. Weber, Dr. Charles Cooté, Mr. Shaw, Mr. De Morgan, Mr. Moore, Mr. Henry, Mr. Nunn, Mr. Flower.

Post-mortem Examinations are conducted by Dr. Cooté.

LECTURERS.—Clinical Medicine: the Physicians to the Hospital.—Theory and Practice of Medicine: Dr. Stewart and Dr. Goodfellow.—Clinical Surgery: the Surgeons to the Hospital.—Surgery: Mr. Shaw.—Physiology: Mr. De Morgan.—Anatomy: Mr. Moore.—Practical Anatomy: Mr. Nunn and Mr. Flower.—Pathological Anatomy: Mr. Sibley.—Chemistry: Mr. Taylor and Mr. Heisch.—Midwifery: Dr. Frere.—Materia Medica: Dr. H. Thompson.—Medical Jurisprudence: Mr. Henry and Dr. Cooté.—Practical Chemistry: Mr. Taylor and Mr. Heisch.—Botany: Mr. Bentley.—Histology: Dr. W. Woodham Webb.—Comparative Anatomy: Mr. Flower.

General Fee for attendance on the Hospital Practice and Lectures required by the College of Surgeons and Apothecaries' Company, £81. This sum may be paid by instalments of £25 at the beginning of the first session, £25 at the beginning of the second session, and £11 at the beginning of the third session. For every additional session, £10.

This fee admits the Students to the Practical Chemistry course, and to all other Lectures delivered in the College except Comparative Anatomy. All general Students are required to perform the duties of Clinical Clerks and of Dressers during each winter and summer session, except the first winter session.

RESIDENT CLINICAL ASSISTANTS.

For the encouragement of Clinical Study, and for the promotion of Clinical Instruction in the Hospital, the Governors have instituted Three Clinical Assistantships, to be awarded on competition to Students who have completed their education in the School. It will be the duty of the Clinical Assistants to observe and record the cases in the Hospital, and generally in the absence of the Medical Officers, to carry out the treatment directed by them. They will reside and board in the Hospital for one year free of expense.

Two House Surgeons are elected by competition from among the Students who have completed their curriculum, and reside and board in the Hospital free of expense. Fee, Twenty Guineas.

Prizes and Certificates are also awarded to the Students who have most distinguished themselves, at written periodical Class Examinations, in all the subjects of study embraced in the Session.

The Governor's Prize of Twenty Guineas will be awarded to the Student who, having distinguished himself generally by conduct and acquisitions in the College, shall present the best joint Clinical Reports in Medicine and Surgery.

Parents and Guardians who propose sending Pupils to the Hospital may communicate with the Dean, or with Mr. De Morgan, Treasurer to the College at the Hospital, daily from One to Three o'clock. Information may also be obtained on application to any of the Lecturers, or to Dr. Corfe, the Resident Medical Officer.

All students on entering will be required to sign an undertaking to conform to the laws relating to the discipline of the Hospital and College.

T. W. NUNN, Dean.

St. Bartholomew's Hospital and

MEDICAL COLLEGE.—The WINTER SESSION will commence on OCTOBER 3rd, with an INTRODUCTORY ADDRESS by Mr. HOLDEN, at Seven o'clock p.m.

LECTURES.

Medicine—Dr. Burrows and Dr. Baly.
Surgery—Mr. Lawrence.
Descriptive Anatomy—Mr. Skey and Mr. Holden.
Physiology and General Anatomy—Mr. Savory.
Chemistry—Dr. Frankland.
Superintendence of Dissections—Mr. Callender and Mr. Smith.

SUMMER SESSION, 1860, Commencing May 1.

Materia Medica—Dr. F. Farre.
Botany—Dr. Kirkes.
Forensic Medicine—Dr. Black.
Midwifery, &c.—Dr. West.
Comparative Anatomy—Mr. McWhinnie.
Practical Chemistry—Dr. Frankland.

HOSPITAL PRACTICE.—The Hospital contains 650 Beds, and relief is afforded to more than 90,000 Patients annually. The In-patients are visited daily by the Physicians and Surgeons, and Clinical Lectures are delivered—On the Medical Cases, by Dr. Burrows and Dr. Farre; on the Surgical Cases, by Mr. Lawrence, Mr. Stanley, Mr. Lloyd, and Mr. Skey. The Out-patients are attended daily by the Assistant-Physicians and Assistant-Surgeons.

COLLEGIATE ESTABLISHMENT.—Students can reside within the Hospital Walls, subject to the rules of the collegiate system, established under the direction of the Treasurer and a Committee of Governors of the Hospital. Some of the Teachers and other Gentlemen connected with the Hospital also receive Students to reside with them.

SCHOLARSHIPS, PRIZES, &c.—At the end of the Winter Session, examination will be held for two Scholarships of the value of £45, for the year. The Examination for Prizes and Certificates of Merit will take place at the end of the Winter and Summer Sessions.

Further information may be obtained from Mr. Paget, Mr. Holden, or any of the Medical or Surgical Officers or Lecturers; or at the Anatomical Museum or Library.

Surgeons' Hall, Edinburgh.

WINTER SESSION 1859-60.

The INTRODUCTORY ADDRESS will be delivered by Dr. SKAE on November 2, at 2 p.m. The prospectus may be obtained on application to Dr. John Struthers, Secretary to the Medical and Surgical School.

Marischal College and University,

ABERDEEN.—FACULTY OF MEDICINE.

WINTER SESSION 1859-60, of Six Months' duration, commences on MONDAY, November 7.

CLASSES.

Anatomy—Dr. A. J. Lizars; 12 noon. £3 3s.
Practical Anatomy, and Anatomical Demonstrations.—Dr. A. J. Lizars, at 2 p.m. £2.

Chemistry—Dr. Clark and Mr. Brazier; 3 p.m. £3 3s.
Materia Medica—Dr. Henderson; 9 a.m. £3 3s.

Medical Logic and Jurisprudence—Dr. Ogston; 9 a.m. £3 3s.

Institutes of Medicine—Dr. Ogilvie; 4 p.m. £3 3s.

Practice of Medicine—Dr. Macrobini; 3 p.m. £3 3s.

Surgery—Professor Pirrie; 1 p.m. £3 3s.

Midwifery and Diseases of Women and Children—Dr. Dyce; 4 p.m. £3 3s.

Natural History—Professor J. Nicol; 11 a.m. £3 3s.

Janitor's Fee for each of the above classes, 2s. 6d. No other fees are charged, except some small dues in the Natural History Class.

SUMMER SESSION.

Botany—Dr. Beveridge; 8 a.m. £2 2s.

Practical Anatomy and Demonstrations—Dr. A. J. Lizars; 12 noon. £2 2s.

Dietetics and Hygiene—Dr. Henderson; 1 p.m. £2 2s.

Practical Chemistry—Dr. Clark and Mr. Brazier; 11 a.m. £3 3s.

Histology—Dr. Ogilvie. £2 2s.

The various Courses delivered at this University qualify for examination here, and at the several Universities of the United Kingdom; the Royal Colleges of Surgeons of England, Edinburgh, and Ireland; the Apothecaries' Hall, London; and the Medical Boards of the Army, Navy, and Indian Service.

Graduates who have attended the several Medical Classes in this University will be charged no Graduation Fees for the Degree of M.B.

HOSPITAL PRACTICE.

Hospital Practice daily, at Ten o'clock, at the Royal Infirmary, which contains 300 beds.

Physicians—Drs. Dyce, Kilgour, Nicol, and Williamson.

Surgeons—Messrs. Keith, Pirrie, Kerr, and Redfern.

Ophthalmic Surgeon—Dr. Cadenhead.

Lectures on Clinical Medicine—Dr. Kilgour.

Lectures on Clinical Surgery—Mr. Keith.

Fee to the Hospital, £3 3s.; perpetual ditto, £5 5s. Fee to the Clinical Lectures—First year, £2 2s.; second year, £2 2s.; afterwards free.

THE LUNATIC ASYLUM.

A limited number of pupils are permitted to witness the practice pursued in this Asylum, which contains about 280 patients.

Medical Superintendent—Dr. Jamieson.

Consulting Physician—Dr. Macrobini.

A Course of Clinical Instruction in the Treatment of Insanity is given by Dr. Jamieson. Fee, £2 2s.

Besides the College Library, there is, in the Hall of the Medico-Chirurgical Society of Aberdeen, a Medical Library, containing 4000 volumes, with a Reading-room attached. Admission to the Society by ballot. Terms for Students, £1 1s. yearly.

The Aberdeen General Dispensary, Vaccine, and Lying-in Institution, is open to Students, on application to the Medical Officers. There are annually about 5000 patients, either prescribed for in the Institution, or visited at their own houses.

Queen's University in Ireland.

QUEEN'S COLLEGE, GALWAY.

SESSION 1859-60.

FACULTY OF MEDICINE.

The Matriculation Examinations, in the Faculty of Medicine, will commence on Tuesday, the 18th of October.

Additional Matriculation Examinations will be held on Thursday, the 24th of November.

Matriculation is necessary for those Students only who intend to proceed for the degree of M.D. in the Queen's University, or to become Candidates for Scholarships, Exhibitions, or Prizes in the College.

SCHOLARSHIPS AND EXHIBITIONS.

In the Faculty of Medicine six Junior Scholarships of the value of £20 each, and six Exhibitions of the value of £10 each, are appropriated as follows:—Two Scholarships and two Exhibitions to Students of the first, second, and third years respectively. Also, two Senior Scholarships of the value of £40 each, and two Exhibitions of the value of £18 each are appropriated to Students of the fourth year.

The Examinations for Scholarships and Exhibitions will commence on Thursday, the 20th October, and be proceeded with as laid down in the Prospectus.

In addition to the Scholarships and Exhibitions above mentioned, Prizes will be awarded by each Professor at the close of the Session.

Scholars of the first, second, and third years, are exempted from a moiety of the Class Fees.

The Medical School of Queen's College, Galway, affords ample means for the acquisition of Medical and Surgical knowledge.

MUSEUMS.—An extensive Museum, illustrative of Anatomy and General Pathology, Materia Medica, and Toxicology has been provided; and to facilitate the study of the Obstetric branch of Medical Science, the College has purchased the Montgomery Museum.

HOSPITALS.—The Hospitals, to which Students are admitted, contain 200 beds, and are visited every morning by the Medical Professors, who deliver Clinical Lectures.

In order to induce Medical Students to attend the practice of the Hospitals during the entire course of their education, the fee for Hospital Attendance and Clinical Lectures conjointly has been reduced to £2 for each Session.

COLLATERAL SCIENCES.—Laboratories and every requisite appliance exist for the cultivation of Chemistry and Natural Philosophy. The College is furnished with a Museum of Natural History, and a Botanical Garden. Botanical excursions are conducted by the Professor in the proper season.

Further information may be had on application to the Registrar, from whom copies of the Prospectus may be obtained.

By Order of the President,

1st September, 1859.

WM. LUPTON, M.A., Registrar.

King's College, London.—Medical

DEPARTMENT.—The WINTER SESSION, 1859-60, will commence on SATURDAY, OCTOBER 1, 1859, on which day all Students are expected to attend the Introductory Lecture, at Two o'clock.

The following Courses of Lectures will be given :—

Anatomy—Professor Richard Partridge, F.R.S.
Physiology; General and Morbid Anatomy—Professor Lionel S. Beale, M.B.
Chemistry—Professor W. A. Miller, M.D. F.R.S.
Principles and Practice of Medicine—Professor George Budd, M.D.
Principles and Practice of Surgery—Professor William Fergusson, F.R.S.

KING'S COLLEGE HOSPITAL.

Physicians... { George Budd, M.D. F.R.S.
R. B. Todd, M.D. F.R.S.
George Johnson, M.D.
W. A. Guy, M.B. F.R.S.
Lionel S. Beale, M.B. F.R.S. } With care of In-Patients.
Physician for Diseases of Women and Children and Physician-Accoucheur—Arthur Farre, M.D. F.R.S.
Assistant-Physicians—Charles Murchison, M.D.; Conway Evans, M.B.
Surgeons ... { W. Fergusson, F.R.S.
Richard Partridge, F.R.S.
William Bowman, F.R.S. } With care of In-Patients.
Assistant-Surgeons—John Wood, F.R.C.S.; John W. Hulke, F.R.C.S.
Surgeon-Dentist—S. Cartwright, jun.

The Hospital is visited daily. Clinical Lectures are given every week, both by the Physicians and by the Surgeons. The Physicians' Assistants and Clinical Clerks, the House-Surgeons and dressers, are selected by examination from the Students of the Hospital.

SCHOLARSHIPS.—New Students will have the privilege exclusively of contending, in October, 1859, for five Warneford Scholarships—viz., two of £25 per annum, for three years, and three of £25 per annum, for two years. The Examination will commence on the 29th of September, in Divinity, Classics (subjects the same as for the Matriculation Examination this year at the University of London), Mathematics, History, and the Modern Languages.

One Scholarship of £40, tenable for two years; one of £30, for one year; and three of £20 each, for one year, will be filled up in April next, the subjects of the Examination being exclusively Medical.

Further particulars may be obtained from J. Harley, Esq., Sub-Dean of the Department; and a detailed Prospectus will be forwarded by application to J. W. Cunningham, Esq., Secretary.

R. W. JELF, D.D., Principal.

Highland and Agricultural Society.—

EDINBURGH VETERINARY COLLEGE.

The Committee of the Highland and Agricultural Society of Scotland, appointed to superintend the Veterinary College, hereby intimate that the Session will commence on Wednesday, November 2, at 4 p.m. The Course of Study includes the following classes :—

1. Zoiatrics, Veterinary Medicine, and Surgery—Professor Dick.
2. Zootomy, or Veterinary Anatomy, and Anatomical Demonstrations—Mr. Strangeways.
3. Chemistry, embracing Veterinary Materia Medica and Pharmacy—Dr. Allen Dalzell.
4. Practical Chemistry—Dr. Allen Dalzell.
5. Microscopic Zootomy, Physiological and Pathological—Dr. Young.
6. Practical Pharmacy and Clinical Instruction—Professor Dick, assisted Mr. Worthington, V.S.

JOHN HALL MAXWELL.

Edinburgh, September 17, 1859.

Evening Demonstrations of Anatomy.

—Mr. CHRISTOPHER HEATH, Demonstrator of Anatomy at the Westminster Hospital, will resume his Evening Course of DEMONSTRATIONS and EXAMINATIONS upon the DISSECTED SUBJECT on Wednesday, the 5th of October. The Demonstrations take place on Monday, Wednesday, and Friday evenings, during the Winter Session, from Seven to Nine o'clock, at the Westminster Hospital. Entrance Fee (perpetual) Five Guineas.

To Surgeons, Dentists, &c.—The

Best House in London for SECOND-HAND INSTRUMENTS is Mr. WM. LAWLEY'S, Lombard-house, 78, Farringdon-street, City. Established upwards of a Century. A large stock of New Instruments always on sale, all warranted. Instruments bought, sold, or exchanged.

N.B.—The largest stock of Second-hand Dissecting Cases in London.

The Bitter-Water of Friedrichs Hall

enjoys deservedly a very high reputation amongst Medical Men on the Continent, and in directing the attention of the Medical Profession in this country to the extraordinary virtues of this water, we can mention with here only a few of the chief diseases in which it has been prescribed with the most beneficial results—viz., Diseases of the Stomach and Bowels, especially Indigestion, Loss of Appetite, and habitual Constipation; Enlargement and Indurations of the Liver, with or without Jaundice or Dropsy; Diseases of the Kidney, including Albuminuria, Affections of the Sexual Organs, and the numerous accidents which so many women are subject to at their critical age, and the inconveniences resulting from pregnancy; also Hypertrophy of the Heart, Determination of Blood to the Head and Lungs, Hypochondriasis, and Gout, must be mentioned. One peculiar advantage which this water possesses over most other bitter waters is, that it is given only in small quantities—viz., a wineglassful, either before breakfast or on going to bed; that it may be taken at all seasons, and requires neither a particular diet nor exercise in the open air. Further information, with cases, will be found in Dr. Eisenmann's Monograph of this Water, which may be had gratis at Messrs. A. and R. THWAITES and CO.'s, 147, Regent-street, London, and 57, Upper Sackville-street, Dublin, who have just received a fresh supply of this Bitter-water.

Scammony Manufactured from the

ROOT.—This Pure Resin may be had of all Wholesale Druggists at 25 per cent. under the price of the best Virgin Scammony.

And the superiority of its quality was fully explained at a meeting of the Pharmaceutical Society, and reported at length in their Journal of March last, from which the following are extracts :—

"From these numerous observations, one hundred and twenty in number, together with many others which have not been tabulated, I am quite convinced that the scammony prepared by the new process from the untapped root is quite equal, as a remedy, to the very best virgin scammony which is met with in commerce, and equal, in fact, to the resin which is extracted from commercial scammony by means of ether; and it possesses this most important advantage over the scammony of commerce, namely, of being entirely free from the frauds which are almost constantly practised upon it in the country where the plant grows, and in which it has hitherto been collected, and, therefore, being perfectly uniform in its physical characters, composition and therapeutic action. There can, therefore, be no objection, but, on the other hand, manifest advantage, in employing it in place of the scammony commonly met with.

"A. B. GARROD, M.D., F.R.S., F.R.C.P.
"Professor of Materia Medica, Therapeutics and Clinical Medicine at University College; Physician to University College Hospital."

"I have endeavoured to ascertain the relative activity of Messrs. M'Andrew's scammony, and of a fine specimen of commercial virgin scammony, by prescribing these drugs alternately in equal doses to the same patient. The results, according to the judgment of myself and others who have assisted me in watching the cases, is that in most instances Messrs. M'Andrew's scammony has proved itself decidedly more active than the virgin scammony. As to pleasantness of operation, or the reverse, there seemed to be no choice between the two specimens.

"That a preparation of scammony should be a little more or a little less active is of comparatively small importance. It is far more important that the drug should have a fixed and uniform composition and activity, so that the prescriber may know, with an approach to certainty, what doses are required to produce a given effect. This advantage of uniform activity Messrs. M'Andrew's scammony seems likely to possess over the scammony which has hitherto been in common use, and which is a drug notoriously of most uncertain composition and power.

"GEORGE JOHNSON, M.D., F.R.C.P.
"Professor of Materia Medica and Therapeutics in King's College; Physician to King's College Hospital."

Mr. Howard, Surgeon-Dentist, 52,

FLEET-STREET, has introduced an entirely NEW DESCRIPTION OF ARTIFICIAL TEETH, fixed without Springs, Wires, or Ligatures. They so perfectly resemble the natural teeth as not to be distinguished from the original by the closest observer; they will NEVER CHANGE COLOUR or DECAY, and will be found very superior to any teeth ever before used. This method does not require the extraction of roots, or any painful operation, and will give support and preserve teeth that are loose, and is guaranteed to restore articulation and mastication; and that Mr. Howard's improvements may be within the reach of the most economical, he has fixed his charges at the lowest scale possible. Decayed Teeth stopped and rendered sound and useful in mastication. 52, Fleet-street. At home from Ten till Five.

Surgical Instruments. -- Students

about commencing their studies at the ensuing Session can obtain, at BAILEY'S, 418, OXFORD-STREET, every description of Anatomical, Dissecting, Amputating and Pocket Instruments, of the very best quality, and at a moderate price.

Student's Dissecting Case, complete	10s. and 12s 6d.
Post-Mortem Case	£2 2 0
Pocket Cases, from	1 1 0
Case of Tooth Instruments	1 1 0

TRUSSES, ENEMAS, ELASTIC STOCKINGS, &c.

An Illustrated Catalogue will be sent free upon application.
W. H. BAILEY, 418, OXFORD-STREET, LONDON, W.

W. F. Durroch, Surgical Instrument

MAKER to the Royal Navy and Greenwich Hospital, respectfully informs the Profession that he continues to MANUFACTURE SURGICAL INSTRUMENTS of every description, of the best quality and highest finish, to which are applied all the improvements introduced by the first authorities of the day. The patronage and approval of the most eminent practitioners and lecturers warrant him in assuring gentlemen who may honour him with their commands that all his instruments will be found highly adapted for the purposes designed. Established 1748. No. 2, New-street, St. Thomas-street (near the Hospital), Southwark.
DAVIS & KIDDER'S MEDICO-MAGNETIC MACHINES.

Struve's Seltzer, Marienbad, Vichy,

KISSINGEN, and other MINERAL WATERS.—Under her Majesty's especial Patronage.—ROYAL GERMAN SPA, BRIGHTON, STRUVE'S PUMP-ROOM and PROMENADES, offering every facility for a Course of Mineral Waters, as perfect and beneficial as at the natural springs, are NOW OPEN, for the Thirty-fifth Season. A prospectus, with the highest Medical testimonials, may be obtained gratis, at the Pump-room, or from George Waugh and Co. Chemists to the Queen, 177, Regent-street (westside), London, and other respectable houses in London and the provincial towns, where orders for Struve's Bottled Mineral Waters continue to be executed.

CAUTION.—The success obtained by Struve's Mineral Waters, owing to their perfect identity with those of the natural springs, has induced several parties to attempt imitations, sold as "Brighton Seltzer," "Brighton Vichy," &c., an analysis of some of which has shown an utter disregard of their true chemical composition. To distinguish Struve's Waters from all others, every bottle has a label and red ink stamp over the cork, each bearing Struve's name, without which name none is genuine, though contained in Struve's old bottles.

NEPENTHE, OR ANODYNE TINCTURE

(OBTAINED EXCLUSIVELY FROM OPIUM).

PREPARED AT THE LABORATORY OF FERRIS, TOWNSEND, LAMOTTE, & BOORNE,
MANUFACTURING CHEMISTS AND WHOLESALE DRUGGISTS, BRISTOL.

This preparation has now been for many years extensively used by a large number of eminent members of the Medical Profession with the greatest success. It does not produce headache, stupor, giddiness, prostration of strength, constipation, or the usual unpleasant symptoms attending the use of other preparations of opium.

Nepenthe has frequently been found of essential service in cases of Cancer, where every other opiate has failed.

The following Testimonials received from Medical gentlemen in extensive practice will be regarded as satisfactory proof of its efficacy:—

MEDICAL TESTIMONIALS.

"Having prescribed your 'Anodyne Tincture' in many cases, I would strongly recommend its more general adoption. It is especially useful in the wakefulness common after parturition, or other unusual exertion or excitement. It produces a refreshing sleep, and I do not remember any case in which it has caused the objectionable effects of the other opiate preparations.

"SAML. GRIFFITH, M.D. London, M.R.C.P.

“SAML. GRIFFITH, M.D. London, M.R.C.P.
Consulting Physician-Accoucheur to the Farringdon Dispensary,
Physician-Accoucheur to St. Thomas's Hospital, &c.”

"Gentlemen,—I have great satisfaction in bearing testimony to the value of your 'Nepenthe,' in relieving suffering from disease, and in procuring sleep where ordinary narcotics fail or disagree. For several months I have found it very effectual in relieving a great sufferer when all the ordinary anodynes had ceased to benefit, and although the dose has not been increased for months, the relief is as complete.

"Nepenthe" is a very valuable addition to our means of relief, and the Profession and the public are greatly your debtors for it.

"I am, Gentlemen, yours obediently,

“To Messrs. Ferris & Co.

"Gentlemen,—'Nepenthe' has, for some time, been a favourite narcotic with me, and I infinitely prefer it to any preparation of opium now extant. It has proved a remedy of great value in all cases of Neuralgia, Chronic Rheumatism, Hypochondriacism, and indeed all affections where the use of a sedative is indicated; and in Delirium Tremens it is certainly invaluable, performing its operation upon the system, without leaving those distressing feelings consequent upon the use of opiates in general.

"I remain, Gentlemen, your obedient Servant,

"WILL. WOOD BRADSHAW, M.D. M.R.C.P. & F.R.C.S. Lond. &c. &c. &c."

Extract of a Letter from the late G. W. CAINES, Esq. M.R.C.S.

“Please to send me some ‘Nepenthe,’ as I have a patient with cancer in the breast, with whom no other preparation of opium agrees. I have tried them all.”

NEPENTHE may be procured direct from Messrs. FERRIS and CO., 4 and 5, Union-street, Bristol; from respectable Dispensing Chemists throughout the Kingdom; and from the following Agents:—

LONDON :—Mr. Thos. Keating, 79, St. Paul's-churchyard; Messrs. Evans, Lescher, and Evans, 60, Bartholomew-close; Messrs. Savory and Moore, 143, New Bond-street; Messrs. J. Bell and Co., 338, Oxford-st.

MANCHESTER :—Mr. James Woolley.

LIVERPOOL:—Messrs. Clay and Abraham; Messrs. Evans, Son, and Co.; Messrs. Clay, Dod, and Case.

BIRMINGHAM :—Messrs. Southall Bros. and Co.

YORK:—Messrs. Butterfield, Clarke and Co.

NORWICH:—Messrs. Smith and Sons.

PLYMOUTH:—Messrs. Balkwill and Co.

EXETER:—Mr. Geo. Cooper; Messrs. A. Evans and Co.

EDINBURGH :—Messrs. Raimes and Co.

As many imitations of Nepenthe have been attempted, the signature of FERRIS and COMPANY is placed over the cork of every bottle of the true preparation; and none purchased without this protection can be depended upon.

DR. DE JONGH'S
(*Knight of the Order of Leopold of Belgium*)

LIGHT-BROWN COD-LIVER OIL.

CAUTION.

Serious and repeated complaints having been made of a discreditable system pursued by many Chemists and Druggists of intrusively recommending or surreptitiously substituting a pale, yellow, or coarse brown preparation, when Dr. DE JONGH'S Oil is prescribed, the Medical Profession are respectfully and earnestly solicited to afford their assistance in counteracting and repressing a practice alike injurious to their patients and to the fair repute of a remedy now so generally and so justly estimated. In all cases where this Oil cannot be procured from a respectable Chemist, application should be made to Dr. DE JONGH'S Agents,

ANSAR, HARFORD, & CO., 77, Strand, London, W.C.

By whom any quantity will be immediately forwarded.

WALTERS' INDIA-RUBBER URINALS.

F. WALTERS having originally invented these Urinals, begs to warn the Profession of the many bad and useless imitations which are now sold, and he would advise them, before purchasing, to look that they are stamped with his name; as, unless that be the case, he cannot guarantee them.

These conveniences are made for those who require them only occasionally, during a long journey, as well as for those invalids who use them always. MR. WALTERS has much improved them by making them of *Ætherised India-Rubber*, which adds very greatly to the strength of the India-Rubber, at the same time that it prevents its sticking together; by this means he is enabled to make them less stiff and harsh than hitherto, and yet to retain all the advantages of that stiffness. There is a patent valve, which prevents the return of the fluid; and they may be worn either sitting, walking, or lying, without the slightest inconvenience, and without being perceived by any one.

WALTERS' CONVENIENCES FOR LADIES will be found particularly useful during pregnancy. They are perfectly soft and flexible, and may be worn with perfect comfort.

All Orders must be accompanied by a Post-office order or reference.—Entrance for Ladies at the private door, where a Female attends.

MANUFACTURER OF ELASTIC STOCKINGS, BELTS, &c.

16, MOORGATE STREET, NEAR THE BANK, LONDON. E.C.

MEDICAL AGENCY.

NOTICE OF REMOVAL AND CHANGE OF FIRM.

Mr. Lara (for the last eight years the sole representative of LANE and LARA, Medical Agents and Arbitrators and Lunatic Asylum Registrars,) begs to inform the Profession that, in consequence of the daily increasing support with which he has been favoured, and for which he tenders his sincerest thanks and acknowledgments, he has taken into PARTNERSHIP Mr. James Maxfield Walters, a gentleman who has had considerable experience in the business. It will, therefore, from and after Christmas, 1858, be carried on, under the Firm of LARA and WALTERS, at 6, PUMP-COURT, Middle Temple, E.C., whither they have removed their Offices from 22, Buckingham-street, Adelphi, in order to provide that larger accommodation which a constant intercourse with a great majority of the entire body of General Practitioners in England has rendered necessary.

Partnerships and Practices sold and valued: Asylums transferred: Arbitrations effected: Assistants provided (if for a permanence without charge to Employers): and every other description of business transacted for the Profession at a fixed and moderate cost. Attendance from 11 till 4.

Hospital for Sick Children, 49, Great

ORMOND-STREET.—A SERIES of LECTURES on the DISEASES OF CHILDREN will be given every SATURDAY during the months of NOVEMBER, DECEMBER, and JANUARY, by Dr. WEST, Dr. JENNER, and Mr. ATHOL JOHNSON, the Physicians and Surgeon of the Hospital. The First Lecture will be given on SATURDAY, NOVEMBER 12, at 3 p.m., by Dr. WEST.

By order of the Committee of Management,
H. A. BATHURST, Hon. Secretary.

Medical Pupil.—A Lecturer in a

Provincial School of Medicine, who has taken high honours in his Profession, wishes to receive into his house from the 1st of October next, a gentlemanly youth as ARTICLED PUPIL. Terms, 100 Guineas per annum. Address, A.B., 25, Paternoster-row, London.

To Medical Students.—A Physician

and Lecturer at one of the principal Metropolitan Hospitals, residing at the West-end of London, is willing to receive into his family a STUDENT, of quiet industrious habits and gentlemanly character, who would have the advantage of direction and assistance in his studies. Address to P. E., Mr. Churchill's, New Burlington-street, W.

A M.R.C.S. Eng., Thirty years of age,

wishes for a Situation as OUT-DOOR ASSISTANT to a General Practitioner. Salary not less than £100 per annum. Northern Counties preferred. Address, E. C. Mr. Watts', Market-place, Pocklington, Yorkshire.

Dr. Lankester will have a Vacancy for

a HOUSE-PUPIL after the 1st of October next.
8, Savile-row, London, W.

Nervous and Mental Disorders.—Wyke

House, Sion Hill, Islworth, Middlesex, a private establishment for the care and recovery of Ladies and Gentlemen mentally afflicted. Conducted by Mr. ROBERT GARDINER HILL, late Resident Medical Professor of Eastgate House, Lincoln, and by Dr. E. S. WILLETT.

Mental Disorders.—Wye House,

BUXTON, DERBYSHIRE.—PRIVATE ESTABLISHMENT for the Care and Treatment of a select and limited number of persons Mentally affected.

Resident Proprietor—T. DICKSON, L.R.S.C.E.

Late Medical Superintendent of the Manchester Lunatic Hospital. Wye House is delightfully situated in its own grounds of twelve acres at Buxton, and forms part of the magnificent scenery of Wye Dale. The well-known salubrity of Buxton, and the hygienic effects of its waters and baths, renders it a desirable locality for Invalids Nervously or Mentally affected. Ample means are provided for the occupation and amusement of the Patients, including carriage and garden exercise.

Private Establishment for the Insane,

CHURCH STRETTON, near SHREWSBURY. This Establishment is conducted by the Resident Proprietor, Dr. S. G. BAKEWELL, Son of the late Mr. Bakewell, of Spring Vale, Staffordshire.

The Ladies occupy a separate residence, and are under the immediate care of Mrs. Bakewell.

The neighbourhood of Church Stretton is very picturesque and healthy. Its similarity to Malvern is often noticed.

A Carriage is kept for the use of the Inmates.

References can be given to Medical Gentlemen and others in Shrewsbury, Birmingham, Hereford, and throughout Staffordshire.

Church Stretton is a first-class Station on the Shrewsbury and Hereford Railway, twelve miles from Shrewsbury.

West Riding Lunatic Asylum,

WAKEFIELD.—ASSISTANT MEDICAL OFFICER WANTED.—WANTED, at the above Institution, a second ASSISTANT MEDICAL OFFICER, who must be a single man, legally qualified and "Registered." Salary, £100 a-year, with board and furnished apartments.

Applications, stating age and qualifications, accompanied by Testimonials, must be forwarded to me, for inspection by the Magistrates, on or before Saturday, October 15.

By order,
BENJAMIN DIXON, Clerk to the Visitors.

Wakefield, September 6, 1859.

Medical Transfer and Partnership.

30, Bucklersbury, Cheapside.

Mr. Orridge, Medical Transfer Agent,

Referee, and Valuer of Medical Property, may be consulted, at the above Address, by Gentlemen about to receive PARTNERS, or to RELINQUISH or to COMMENCE Practice.

Mr. Orridge is known to many of the Hospital Physicians and Surgeons of London.

He has been concerned professionally for a considerable proportion of the most influential Practitioners (including Partners in many of the leading Medical Firms), to whom he has the satisfaction of being permitted to refer—a privilege that he trusts will be regarded as a proof of the sincerity of his endeavours to conduct these transactions in an honourable and straightforward manner.

Gentlemen desirous of obtaining Mr. Orridge's opinion, or requiring his attendance professionally in any part of England, can obtain terms on application, by (confidentially) transmitting name and address.

Office Hours, from Eleven to Four.

Obstetrical Society of London.—The

next ORDINARY MEETING will be held on WEDNESDAY, Oct. 5, at 8 p.m.; the President, Dr. RIGBY, in the Chair.

The First Session of the Society will terminate in December, up to which time no Entrance Fee will be demanded. The Council beg to intimate their intention of recommending the Society to require the payment of an Entrance Fee of One Guinea, in addition to the Annual Subscription, by Fellows elected subsequently to this date.

Gentlemen desirous of becoming Fellows are requested to apply to one of the Honorary Secretaries.

By Order of the Council, GRAILY HEWITT, } Hon. Secs.
THOS. H. TANNER, }
53, Berners-street.

ANATOMY, PHYSIOLOGY, PATHOLOGY, AND SURGERY.

Mr. Tuson, Surgeon for many years

to the Middlesex Hospital, will commence a Course of Lectures and Examinations on the above subjects, on Monday, October 3, at half-past nine o'clock A.M., at his residence, 6, Devonshire-street, Portland-place. Mr. Tuson having completed a series of Anatomical Models, is enabled to demonstrate all the parts of the body at any time the same as recent dissections. The Museum will be opened to enable Gentlemen to study the various structures.—Terms, Five Guineas the Course.—A Vacancy for a Resident Pupil.
6, Devonshire-street, Portland-place.

Wanted.—A Medical Assistant, in

Cornwall, with Qualifications from both College and Hall. Unexceptionable references required. Salary, £100 per annum. Address, E. P., care of Mr. Bishop, Advertising Agent, Lilypot-lane, London, E.C.

To Curators of Museums, Lecturers on

ANATOMY, ARTISTS, STUDENTS, &c., &c. JOHN WILLIS respectfully informs the above that he articulates and repairs Skeletons. Human and Comparative Anatomy on the most reasonable terms. Students, &c., supplied with dogs and cats. Orders punctually attended to. Address, John Willis, 38, Great St. Andrew-street, Bloomsbury.

Royal College of Physicians of

EDINBURGH.

At an EXTRAORDINARY MEETING of the ROYAL COLLEGE of PHYSICIANS of EDINBURGH, held on Friday, the 19th of August, the following Resolution was unanimously agreed to:—

"That, in accordance with the opinion expressed by the General Council of Medical Education and Registration, on the 8th August, the Royal College of Physicians of Edinburgh do institute an Examination in Practical Medicine, to be undergone by Candidates, other than University Graduates claiming exemption under the Charter of the College; and that the College agree to alter Law 8 of the Regulations for the admission to the Licence, in accordance with the preceding Resolution."

The opinion of the General Medical Council, as expressed on the 8th August, is all follows:—

"That the General Medical Council is of opinion, that for the future no Licence or Degree should be given by any of the bodies in Schedule (A) to the Medical Act, without Examination."

The eighth Regulation, regarding the conferring of the Licence of the College, ran thus:—

"For one year after the passing of these Regulations (20th April, 1859), Licentiates of any of the existing Licensing Boards may be admitted Licentiates of the College without Examination, provided that they do not derive any profit from the sale of Drugs or Medicine, and that they produce certificates of character and professional qualification satisfactory to the College."

In conformity with the above Resolution, all Applicants under Regulation 8, for the Licence of the Royal College of Physicians of Edinburgh, with the exception of Graduates of British Universities, will in future be required to appear before the Examiners of the College, and to pass an Examination in the Practice of Medicine.

The Stamp-duty on the Diploma having been remitted, the Fee payable by Licentiates is now Ten Pounds.

In name and by authority,

Edinburgh, August 19, 1859. D. R. HALDANE, M.D., Hon. Sec.

7. Inquisition in Lunacy on Miss Ewings.
London: Longman, Green, and Co., Paternoster-row.

This day is published, fcap. 8vo, 5s.
The Natural History of the European SEAS. By the late Professor EDWARD FORBES, F.R.S., &c. Edited and continued by ROBERT GODWIN-AUSTEN, F.R.S.
John Van Voorst, 1, Paternoster-row.

Just Published, the Eighth Edition, price 12s. 6d.
Druitt's Surgeons' Vade-Mecum; a Manual of Modern Surgery, the Eighth Edition, much enlarged, improved and illustrated by 328 highly-finished Wood Engravings.
London: Henry Renshaw, 356, Strand, and John Churchill, New Burlington-street.

Fourth Edition, Revised and Enlarged, two volumes, 8vo, 34s.
Lectures on the Principles and Practice of PHYSIC. By THOMAS WATSON, M.D., Physician Extraordinary to the Queen.
London: John W. Parker and Son, West Strand.

New Series of Guy's Hospital Reports.

One Volume published Annually. Price 7s. 6d.; Subscribers, 6s.
VOLUME V. published OCTOBER 1, 1859.

CONTENTS.

Gastrotomy, by Mr. Cooper Forster—Injuries and Diseases of Nervous System, by Mr. Bryant—Ruptured Uterus, by Dr. Braxton Hicks—Morbus Addisonii, Melanæmia, Leucocythæmia, &c., by Dr. Wilks—Malposition of Abdominal Viscera, Pyæmia, &c., by Dr. Habershon—Treatment of Rheumatic Fever, by Dr. Whitley—Lesions of Nervous System producing Diabetes, by Dr. Pavy—On the Surgery of New Growths, by Mr. Birkett—On Intra-cranial Aneurism; Effect on the Lung by Disease of Pneumogastria; Urticaria, &c., by Dr. Gull—Dental Pathology, by Mr. Salter—Diagnosis and Treatment of Heart Disease, by Dr. Barlow—Tests for Arsenic, by Dr. Odling—Cases of Aneurism, by Mr. Poland—Report of Cases of Poisoning—Description of Wax Models of Elephantiasis, &c. &c.

The Volume will contain 11 Plates, and a coloured one of Addison's Disease, together with numerous Woodcuts.

Communications may be made to the Editors, Guy's Hospital, respecting Subscriptions and obtaining former Volumes.

John Churchill, New Burlington-street.

Post 8vo, cloth, 6s. 6d.

Illustrations of Difficult Parturition,

WITH PRACTICAL COMMENTARIES. By J. HALL DAVIS, M.D. Licentiate of the Royal College of Physicians, Physician to the Royal Maternity Charity.

"The author's position and large experience entitle his opinions to respect. . . . The Clinical Report contains one hundred and forty-four instructive histories, related in a clear, concise manner."—Dublin Quarterly Medical Journal.

"We must refer our readers to Dr. Davis's book for his opinions. . . . We feel high respect for his judgment and intelligence."—Medico-Chirurgical Review.

"The result of five-and-twenty years spent for the most part in the responsible and trying position of Physician to the Royal Maternity Charity is in due time and season produced in the form of an unpretending but satisfactory volume."—Medical Times and Gazette.

"Amongst the many valuable contributions to Clinical Midwifery, this book of Dr. Hall Davis will, we think, occupy a permanent place."—The Lancet.

John Churchill, New Burlington-street.

On the 1st of October, 1859, price One Shilling.

The Pharmaceutical Journal. Second

Series. No. 4. CONTAINING THE

TRANSACTIONS OF THE PHARMACEUTICAL SOCIETY.

CONTENTS.—The Evidence in Dr. Smethurst's Case—Subscriptions to the Jacob Bell Memorial—Our Evening Meetings—Observations on some Preparations of the Pharmacopœia—On Donovan's Solution—On the Absence of Sugar in the Urine in Diabetes Insipidus—Arsenic in Pyrites—Botanical and Pharmacological Inquiries and Desiderata—Results of Physical and Chemical Investigation and Applications in the Arts—Some Facts in Relation to the Solubility of Phosphate of Iron—On Marsh Selinum as a Remedy in Epilepsy—The Use and Properties of Perchloride of Iron—Process for Ascertaining the Proportion of Quinine in Cinchona Bark—Treatment of Tetanus by the Woolara Poison—Bad Quality of Glass—Poisoning by Strychnine given in place of Santonine—Suicide by Oxalic Acid—Obituary: Death of Professor Henfrey, &c.

VOLUME XVIII. may be had in boards, as well as the preceding Volumes, price 12s. 6d. each.

John Churchill, New Burlington-street;
Maclachlan and Stewart, Edinburgh; and Fannin and Co., Dublin.

Just published, 8vo, 1s.

The Mortality after Operations of

AMPUTATION OF THE EXTREMITIES, and the Causes of that Mortality. By ARTHUR ERNEST SANSOM, Associate of King's College. The Prize Essay of the Medical Society of King's College, London.

"The author of this Prize Essay of the Medical Society of King's College, has given us an interesting pamphlet upon an important subject. He has collected a large mass of authentic material, and has deduced from it conclusions which are of value."—The Lancet.

"We can assure our readers that it will well repay perusal."—British and Foreign Medical Review.

John Churchill, New Burlington-street.

The Edinburgh Review, No. 224.

Will be published on Saturday next.

CONTENTS:

1. Bain's Psychology.
2. A Visit to England in 1775.
3. Sir Emerson Tennent's Ceylon.
4. Carlyle's *Frederic the Great*.
5. The Graffiti of Pompeii.
6. The Virginians.
7. The Italian Campaign of 1859.
8. Unpublished Correspondence of Madame du Defand.
9. Senior's Journal in Turkey and Greece.
10. Secret Organisation of Trades.

London: Longman and Co. Edinburgh: A. and C. Black.

NEW EDITION OF DR. WEST'S WORK ON CHILDREN'S DISEASES.
Just published, in 8vo, price 14s. cloth.

Lectures on the Diseases of Infancy

and CHILDHOOD. By CHARLES WEST, M.D., Physician to the Hospital for Sick Children, and Physician-Accoucheur to St. Bartholomew's Hospital. A new Edition, being the Fourth, revised throughout and enlarged.

London: Longman, Green, Longman, and Roberts.

DR. STEGGALL.

STUDENTS' BOOKS FOR EXAMINATION.

A Manual for Apothecaries' Hall

and other MEDICAL BOARDS. Twelfth Edition, 12mo, cloth, 10s.

A MANUAL FOR THE COLLEGE OF SURGEONS; Intended for the Use of Candidates for Examination, and Practitioners. Second Edition, 12mo, cloth, 10s.

GREGORY'S CONSPECTUS MEDICINÆ THEORETICÆ. The First Part, containing the Original Text, with an Ordo Verborum, and Literal Translation. 12mo, cloth, 10s.

THE FIRST FOUR BOOKS OF CELSUS; containing the Text, Ordo Verborum, and Translation. Second Edition, 12mo, cloth, 8s.

A TEXT-BOOK OF MATERIA MEDICA AND THERAPEUTICS. 12mo, cloth, 7s.

FIRST LINES FOR CHEMISTS AND DRUGGISTS PREPARING FOR EXAMINATION at the PHARMACEUTICAL SOCIETY. Second Edition, 24mo, cloth, 3s. 6d.

John Churchill, New Burlington-street.

Post 8vo, cloth, 10s. 6d.

Digestion and its Derangements.

By THOS. K. CHAMBERS, M.D., Physician to St. Mary's Hospital, and Lecturer on Medicine at St. Mary's Medical School.

"There is common sense and sound philosophy in the views taken by Dr. Chambers."—Medical Times and Gazette.

"It is a book which we would, with a good conscience, recommend to a brother practitioner, or place in the hands of a pupil."—Association Medical Journal.

"This is no common publication, to be taken up and thrown aside, but the result of deep study and patient investigation. No person can rise from the perusal of this scientific work without a feeling of deep and deserved respect for the accomplished author."—Dublin Quarterly Journal.

John Churchill, New Burlington-street.

8vo, cloth, with Plates, 15s.

On the Organs of Vision: their

Anatomy and Physiology. By THOMAS NUNNELEY, F.R.C.S.E., Lecturer on Surgery in the Leeds School of Medicine; Senior Surgeon to the Leeds General Eye and Ear Infirmary.

"This is the best and most comprehensive treatise on Vision extant in the English language. The anatomy of the Human Eye is given with perspicuity and minuteness. We recommend this work alike to professed students, practitioners, and science amateurs all the world over."—British Medical Journal.

"We cannot conclude this necessarily brief and imperfect notice of Mr. Nunneley's book without again expressing our decided opinion of the talent and research which pervade it. Many abstruse and difficult points are treated in a masterly manner; the plates, some of which are coloured, are very accurate and beautiful; and the entire subject of the Anatomy and Physiology of the Organs of Vision is brought before the Profession with a clearness and completeness for which we shall in vain seek a parallel either in this country or on the Continent."—The Lancet.

John Churchill, New Burlington-street.

8vo, cloth, 10 Plates, 9s.

On Dropsy connected with Disease

of the KIDNEYS (Morbus Brightii), and on some other Diseases of those Organs, associated with Albuminous and Purulent Urine. Illustrated by numerous Drawings from the Microscope. By W. R. BASHAM, M.D., Physician to the Westminster Hospital.

"Whether we have regard to the minuteness of observation and accuracy of delineation displayed in the accounts given of the cases themselves, or the masterly skill with which the important points of each are singled out for observation in the appended 'Remarks,' or to the admirable manner in which the progressive changes in the microscopic characters of the sedimentary deposits are displayed in the plates, we have no hesitation in recommending the book to our readers, as one whose perusal should not be omitted by anyone anxious to treat cases of albuminuria with comfort to himself or advantage to his patients."—Dublin Quarterly Journal of Medical Science, May, 1859.

John Churchill, New Burlington-street.

Just published, new and improved Edition, price 1s.

The Curability of Consumption. Being

a Series of Papers, presenting the most prominent and important Practical Points in the Treatment of the Disease. By F. H. RAMADGE, M.D. Fellow of the Royal College of Physicians, and late Senior Physician to the Royal Infirmary for Diseases of the Chest, &c.

"Dr. Ramadge's treatment is so simple, that I not only feel a high predilection for it, but think it worthy to be recommended to the impartial and careful examination of my Professional brethren."—Hohnbaum.

"Experience convinces us that Dr. Ramadge's work is full of interest, and merits the special attention of practitioners."—Lebeau.

"Pathological anatomy has, perhaps, never afforded more conclusive evidence in proof of the curability of a disease, than it has in that of tuberculous phthisis."—Carswell.

Also by the same Author, price 10s. 6d.

A TREATISE ON ASTHMA AND DISEASES OF THE HEART.

London: Longman and Co.

TEXT BOOKS FOR STUDENTS.

Quain's Anatomy. By Dr. Sharpey and Professor ELLIS. 6th Edition. 400 Illustrations. Three vols. £1 11s. 6d.

Erichsen's Science and Art of Surgery. Second Edition, 400 Illustrations. One vol. 8vo, £1 5s.

Ellis's Demonstrations of Anatomy. Fourth Edition. Small 8vo, 12s. 6d.

Kirkes's Handbook of Physiology. Third Edition. With Illustrations. Small 8vo, 12s. 6d.

Gregory's Handbook of Chemistry. Fourth Edition. Small 8vo, 18s.

Also in Two Volumes (separately).

INORGANIC CHEMISTRY, 6s. 6d. ORGANIC CHEMISTRY, 12s.

Garrod's Essentials of Materia Medica and THERAPEUTICS. Fcap. 8vo, 6s. 6d.

Liebig's Handbook of Organic Analysis. Small 8vo, 5s.

Lardner's Handbook of Natural PHILOSOPHY. 1334 Illustrations. 4 vols. 8vo, 20s. Volumes Separately.

Mechanics, 1 vol. 5s.

Hydrostatics, Pneumatics, and Heat, 1 vol. 5s.

Optics, 1 vol. 5s.

Electricity, Magnetism, and Acoustics, 1 vol. 5s.

Now ready, price 5s. 6d., or free by post to any part of the United Kingdom, price 6s., Fourth Edition, greatly enlarged and improved,

A Grammatical Introduction to the LONDON PHARMACOPEIA, and a KEY to PHYSICIANS' PRESCRIPTIONS. By F. S. LEACH.

"This little work will be found extremely useful to students who have received but an imperfect classical education."—The Lancet.

Hughes and Butler, Medical Booksellers and Publishers, 15, St. Martin's-le-Grand.

DR. KIDD'S MANUAL OF ANÆSTHETICS. Price 4s. 6d.

On Ether and Chloroform.

By CHARLES KIDD, M.D.

"This [work] by Dr. Kidd supplements the posthumous book by Dr. Snow; . . . and is evidently intended to take a high place amongst our standard manuals and monographs."—Medical Circular.

"Dr. Kidd will creditably fill the shoes of the late Dr. Snow."—Edinburgh Medical Journal.

London: Henry Renshaw, 356, Strand.

In cloth, price 15s.

Mr. Guthrie's Commentaries on the SURGERY OF THE WAR. The Sixth Edition, corrected to October 1855.

"This work of the distinguished author will find a place in every surgical library throughout the civilised world."—The Lancet.

London: Henry Renshaw, 356, Strand.

Just published, price 6d. 6d., postage 4d.

Meade's Manual for Examination at APOTHECARIES' HALL or other MEDICAL INSTITUTIONS. Third Edition, Corrected to the present time. Or sold separately—

Part 1, for the First Examination, price 4s.

Part 2, for the Second Examination, price 2s. 6d.

London: Henry Renshaw, 356, Strand.

One Vol. 8vo, cloth lettered, price 3s. 6d.,

On the Constitutional Treatment of FEMALE DISEASES. By EDWARD RIGBY, M.D., etc.

"We know of no other obstetric writer who so strongly insists on the intimate connexion between uterine and constitutional disorders, or who has carried out this principle so consistently and so successfully. On this account we look upon the work as peculiarly valuable, and calculated to do an immensity of good at the present time, by dispelling the one-sided and narrow views so generally prevalent respecting this class of diseases, and placing their pathology and treatment on a sounder and more rational basis."—Dublin Quarterly Journal of Medical Science.

London: Henry Renshaw, 356, Strand.

Just published, post 8vo, cloth, 8s, postage 6d.

The Diseases of Infancy and CHILDHOOD. By T. H. TANNER, M.D., F.L.S., Licentiate of the Royal College of Physicians, late Physician to the Hospital for Women, &c.

"We have much satisfaction in cordially recommending the book as one of the most careful, accurate, and accessible manuals on the subject."—Edin. Med. Journal, August, 1858.

By the same Author,

A MANUAL OF THE PRACTICE OF MEDICINE. Third Edition, revised and improved. 4s. 6d. postage 2d.

A MANUAL OF CLINICAL MEDICINE AND PHYSICAL DIAGNOSIS. 3s. 6d. postage 2d.

MEMORANDA ON POISONS. 1s. postage 1d.

London: Henry Renshaw, 356, Strand.

Royal 8vo, 782 pp. 28s.

Anatomy, Descriptive and Surgical.

By HENRY GRAY, F.R.S., Lecturer on Anatomy at St. George's Hospital. With 363 large Woodcuts, from Original Drawings by H. V. Carter, M.D., late Demonstrator of Anatomy at St. George's.

London: John W. Parker and Son, West Strand.

Complete in two volumes, £2.

Physiological Anatomy and Physiology of MAN. With numerous Original Illustrations. By R. B. TODD, M.D., F.R.S., and W. BOWMAN, F.R.S., of King's College, London.

London: John W. Parker and Son, West Strand.

Just published, fcap. 8vo, cloth, 3s. 6d.

General Debility and Defective

NUTRITION: their Causes, Consequences, and Treatment. By ALFRED SMEE, F.R.S. Senior Surgeon to the Royal General Dispensary, Surgeon to the Bank of England.

John Churchill, New Burlington-street.

Just published, Sixth Edition, foolscap 8vo, 2s. 6d.

Nealthy Skin; a Popular Treatise on the Sk in and Hair, their Preservation and Managemnt.

By ERASMUS WILSON, F.R.S.

John Churchill, New Burlington-street.

In one volume, large 8vo, with Recapitulations and coloured Plates, 18s.

A New Translation of Laennec's

TREATISE on MEDIATE AUSCULTATION and on DISEASES of the LUNGS and HEART, with copious Notes from Meriadec Laennec, Andral, Ramadec, &c. Edited by THEOPHILUS HERBERT, M.D.

"The full and complete manner in which the whole subject of tubercular deposition has been considered is sufficient, independently of all other circumstances, to impress on the present edition of Laennec a value which places it above any other."—The Lancet.

H. Baillière, Publisher, 219, Regent-street.

This day is published price 2s. 6d., Part IX. of

The English Cyclopædia of Arts and SCIENCES, being the Fourth Division of the ENGLISH CYCLOPEDIA, conducted by CHARLES KNIGHT.

Æ This Part comprises from the article "COIN" to the commencement of "COTTON MANUFACTURE."

Vols. I. and II. are now ready, price 12s. each.

The following Divisions are completed:—

Six Volumes, price £3; or in Three Volumes half-bound morocco, price £3 12s.

GEOGRAPHY.

Four Volumes, price £2 2s.; or in Two Volumes, half-bound morocco, price £2 10s.

NATURAL HISTORY.

Four Volumes, price £2 2s.; or in Two Volumes, half-bound morocco, price £2 10s.

* * Any Number or Part may be had separately.

London: Bradbury and Evans, 11, Bouverie-street, E.C.

Just published, Fourth Edition, price 2s. 6d.

A Guide to the Treatment of Diseases

OF THE SKIN. For the use of the Student and General Practitioner. By THOMAS HUNT, Surgeon to the Western Dispensary for Diseases of the Skin. This edition has been carefully revised by the Author, and contains two additional chapters—"On the Vegetable Parasites of the Human Skin," and "On the Doctrine of Metastasis."

London: T. Richards, 37, Great Queen-street.

Medical Diaries for 1860.—Those

published by LETTS, SON, and CO., are of more practical utility, and cheaper than any of their contemporaries. Price 2s., in a neat cloth pocket-book, with clasp and pencil, and from 12s., in a superior Morocco or Russia wallet with places for instruments. Visiting lists are published independently, of four different sizes, at 1s., 1s. 4d., 1s. 8d., and 2s. per quire. Sold by all Booksellers and Stationers, and by Letts, Son, & Co., 8, Royal Exchange, E.C. Descriptive catalogues gratis

DR. LITTLE ON DEFORMITIES.

In 8vo, with 160 Engravings and Diagrams, 15s. cloth,

On the Nature and Treatment of

CONTRACTIONS and DEFORMITIES. By W. J. LITTLE, M.D.,
Senior Physician to the London Hospital, Founder of the Royal Orthopædic
Hospital, &c.

CONTENTS.

1. Deformities in general. Treatment Operative, Instrumental, and Physiological. Forcible Extension under Chloroform.
2. Contractions from Wounds and Diseases of Joints, Accidents, Rheumatism, &c.
3. Contractions from Spasm, Paralysis, Burns, Habitual Retention in one Position.
4. Deformities from Rickets, Weakness, and Curvatures of Bones.
5. Congenital Distortions and Dislocations, Club-foot, Club-hand, &c.
6. Congenital Malformations, Monstrosities.
7. Distortions of the Spine, from Strumous Disease, Rickets, Lateral Curvature, Spasm, and Paralysis.

Appendix : On Relapsed and Neglected Cases. Index.

"The best treatise on the subject in any language."—The Lancet, the British and Foreign Medico-Chirurgical Review, and the Philadelphia Medical Examiner.

On CLUB-FOOT and ANALOGOUS DISTORTIONS, including their Treatment both with and without Surgical Operation. 8vo. Forty-one Engravings. 12s.

On ANCHYLOSIS or STIFF JOINT: a Practical Treatise on the Contractions and Deformities resulting from Diseases of the Joints. 8vo. Thirty-two Engravings. 7s. 6d.

London : Longman, Brown, Green, and Longmans.

Post 8vo, 7s. cloth,

A Guide to the Quadrupeds and

REPTILES of EUROPE, with Descriptions of all the Species. By
Lord CLERMONT.

John Van Voorst, 1, Paternoster-row.

[ESTABLISHED 1841.]

Medical, Invalid, and General Life

OFFICE, 25, Pall-mall, London.—Empowered by special Act of
Parliament

At the SEVENTEENTH ANNUAL MEETING, held on the 25th
November, 1858, it was shown that on the 30th June last.—

The number of Policies in force was 6083

The Amount Insured was £2,551,136 6s. 6d.

The Annual Income was nearly £120,000

The new Policies issued during the last Five years are as follows :—
5411 Policies for £2,599,658, yielding £110,624, in Premiums, showing
an average yearly amount of new business of more than

HALF A MILLION STERLING.

The Society has paid claims on 1002 Policies, assuring £426,044, since its
establishment in 1841.

Assurances are effected at home or abroad on healthy lives at as moderate
rates as the most recent data will allow.

INDIA.—Officers in the Army and civilians proceeding to India, may
insure their lives on the most favourable terms, and every possible facility
is afforded for the transaction of business in India.

INVALID LIVES assured on scientifically constructed tables based on
extensive data, and a reduction in the premium is made when the causes
for an increased rate of premium have ceased.

MEDICAL MEN are consulted in every case, and are paid a Guinea for
each Report, and receive the same advantages as Solicitors for any business
they may introduce.

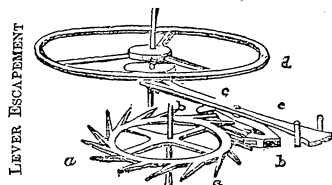

Policies issued free of stamp-duty, and every charge but the premiums.

In the event of death during the days of grace, the risk binding on the
Society if premium paid before the days of grace expire.

Every information may be obtained at the chief office, or on application
to any of the Society's agents. C. DOUGLAS SINGER, Secretary.

Best Iron Wire, prepared expressly by

COCKER BROTHERS, NURSERY-STREET, SHEFFIELD, for
SURGICAL PURPOSES, as supplied to Professor Simpson, Edinburgh ;
Dr. Churchill, Dublin ; Mr. T. Spencer Wells, London ; Dr. Bozeman,
Montgomery, U.S. ; and many others.—See Professor Simpson's Lecture
Medical Times, January 1st, 1859.

LEVER ESCAPEMENT

Benson's

WATCHES.

"Perfection of mechanism."—
Morning Post.

Gold 4 to 100 guineas.

Silver 2 to 50 guineas.

Send two stamps for Benson's

Illustrated Watch Pamphlet.

Watches sent free to any part
of the Kingdom on receipt of a
remittance.

33 & 34, LUDGATE-HILL, LONDON, E.C. ESTABLISHED 1749.

Pepsine.—M. Boudault begs to state

that he cannot be answerable for the purity and strength of any
Preparation sold under his name unless obtained from his sole Agent,
Mr. PETER SQUIRE, Her Majesty's Chemist, 277, Oxford-street, London,
to whom all applications respecting it must be addressed.

Second Edition of Boudault on "Pepsine," with Remarks by English
Physicians. Edited by W. S. SQUIRE, Ph. D., published by J. Churchill,
London, may be also had of the Author, 277, Oxford-street, price
sixpence.

Scammony Manufactured from the

ROOT.—This Pure Resin may be had of all Wholesale Druggists at
25 per cent. under the price of the best Virgin Scammony.

And the superiority of its quality was fully explained at a meeting
of the Pharmaceutical Society, and reported at length in their Journal of
March last, from which the following are extracts :—

"From these numerous observations, one hundred and twenty in
number, together with many others which have not been tabulated, I am
quite convinced that the scammony prepared by the new process from the
untapped root is quite equal, as a remedy, to the very best virgin scam-
mony which is met with in commerce, and equal, in fact, to the resin
which is extracted from commercial scammony by means of ether ; and it
possesses this most important advantage over the scammony of commerce,
namely, of being entirely free from the frauds which are almost constantly
practised upon it in the country where the plant grows, and in which it
has hitherto been collected, and, therefore, being perfectly uniform in its
physical characters, composition and therapeutic action. There can,
therefore, be no objection, but, on the other hand, manifest advantage, in
employing it in place of the scammony commonly met with.

"A. B. GARROD, M.D., F.R.S., F.R.C.P.

"Professor of Materia Medica, Therapeutics and Clinical Medicine
at University College ; Physician to University College Hospital."

"I have endeavoured to ascertain the relative activity of Messrs.
M'Andrew's scammony, and of a fine specimen of commercial virgin
scammony, by prescribing these drugs alternately in equal doses to the
same patient. The results, according to the judgment of myself and others
who have assisted me in watching the cases, is that in most instances
Messrs. M'Andrew's scammony has proved itself decidedly more active
than the virgin scammony. As to pleasantness of operation, or the reverse,
there seemed to be no choice between the two specimens.

"That a preparation of scammony should be a little more or a little less
active is of comparatively small importance. It is far more important that
the drug should have a fixed and uniform composition and activity, so
that the prescriber may know, with an approach to certainty, what doses
are required to produce a given effect. This advantage of uniform
activity Messrs. M'Andrew's scammony seems likely to possess over the
scammony which has hitherto been in common use, and which is a drug
notoriously of most uncertain composition and power.

"GEORGE JOHNSON, M.D., F.R.C.P.

"Professor of Materia Medica and Therapeutics in King's
College ; Physician to King's College Hospital."

Blancard's Pills of Unchangeable

IODIDE OF IRON,

Recommended by the Academy of Medicine of Paris,
And authorised by the Medical Council of St. Petersburg,
Extensively tried in the Hospitals of France, Belgium, Ireland, Turkey, &c.
Favourably noticed at the Universal Exhibition of New York, 1853,
and Paris, 1855.

"Of all the modes hitherto proposed of administering iodide of iron in
the pure state, I think Mr. Blancard's the best."—Chemistry applied to
Therapeutics, by M. Mialhe, Deputy-Professor to the Faculty of Medicine
of Paris, Pharmacien to the Emperor, 1856, p. 319.

These Pills stand now very high in the therapeutics of every country, as
may be seen by the above quotations, and also by the numerous scientific
articles in medical periodicals and works (a).

Being enveloped in a very thin resino-balsamic coating, they present the
great advantage of not being liable to any deterioration, of having no
taste, of being small, and not distressing the stomach. As they possess
the properties both of iodine and iron, they are especially beneficial in
chlorotic, scrofulous, tubercular, or cancerous affections, as also in
leucorrhœa, amenorrhœa, anæmia, &c. &c., and they furnish the medical
man with an excellent means of modifying lymphatic, feeble, and debili-
tated constitutions. Dose, 2 to 4 pills a day.

N.B.—Impure or altered Iodide of Iron is an unsafe remedy, and may
even prove dangerous. Only such bottles as bear an electro-plated seal
fixed to the lower part of the cork, and the signature of the inventor
placed on a green label, are to be considered as prepared by Mr. Blancard.
The public should beware of spurious imitations.

To be had at M. BLANCARD'S, Pharmacien, Rue Bonaparte, No. 40
Paris. General dépôt in England at M. Gabriel Jozéau's, French chemist
49, Haymarket, London. In Ireland, at Mr. Vitties, Stevens's Hospital
Dublin. In the United States, at E. and S. Fougere, Chemists, 30, North
William-street, New York. To be obtained retail from the principal
Chemists.

W. Twinberrow begs to draw the

attention of the Medical Profession to his EXTRACT of INDIAN
HEMP, prepared expressly for him at Calcutta, its peculiar sedative pro-
perties being so beneficial where opiates are inadmissible. Also to his
MEDICINAL EXTRACTS, prepared from the fresh plants (Hyoscyamus
Niger, Conium Maculatum, Atropo, Belladonna, Coptyledon Umbilicus, etc.)
Also to his Liq. Taraxaci, Liq. Galli Aparinis (a valuable alterative), Liq.
Paristarise (diuretic), and Liq. Belce (prepared from the Égile Marmelos, or
Indian Bael), for dysentery and diarrhœa. W. T. has a large supply of
INDIAN BAEL on hand. 2, Edwards-street, Portman-square.

BOUDAUT'S PEPSINE imported in original bottles. *Ext. Laricis Europ.*

OPENING OF THE WINTER SESSION.

THE Session opened at King's College, St. George's, Guy's, and St. Thomas's on Saturday, October 1, as usual; at the other Schools on Monday. We append some account of the Introductory Lectures at all the Schools, with the exception of St. Mary's, where Mr. Ure delivered an excellent address; but no report has yet reached us. At University College there was no lecture, but a *conversazione* was held after the distribution of prizes for the past session.

GUY'S HOSPITAL.

DR. HABERSHON delivered the address. He spoke of the varied aspects of the Medical Profession, and referred to some of the reasons which induced many to join its ranks, as, for instance, the opportunities it afforded of acquiring position and honourable status in society, and of obtaining wealth or a competency in life. He then dwelt upon the varied subjects of scientific inquiry within its sphere, and the interest of its allied sciences. It was then compared with other professions—in its laborious work and benevolent character, having a reward in itself, and elevating man's noblest faculties whilst it benefitted others—in its highest aspect, that it was the pioneer of the Gospel of Christ. The collateral benefits of the Profession were then shown to be accompanied with intrinsic good to the practitioner of the science; and the mental culture and experience which its study afforded were regarded as a superior attainment, and the source of greater satisfaction than the attainment of truth itself. The vigorous mental exercise in attaining knowledge, rather than the mere collection of facts, was represented to be the object of education. It was then shown that Medicine had been influenced at every period of its history by the condition of science generally as existing at that particular time; that the Greek and Roman philosophers had modified in their time Medical opinions; that great advances in mathematical science had exerted their influence. The philosophy of Bacon, he remarked, prepared the way for Sydenham, and the revival in other sciences had been simultaneous with the brilliant discoveries of Hunter. The development of general laws was then shown to have had a greater influence in other sciences in enabling them to lay aside the incumbrances of earlier periods; modes of thought and research were regarded as receiving the impress of national peculiarities, and in individual investigations the characteristics of each mind were manifested. The slower method of inductive philosophy was urged, rather than mere hasty generalisation; but the injury of incorrect statistics in misleading the mind and retarding the advance of science was also shown. The intimate connexion of other sciences—those of mechanics and statics, of chemistry and of electricity—was then referred to, and man shown to be more than a mere mechanism, an intelligent, thinking being. The importance of bearing this fact in mind in the application of science to the treatment of disease, as well as in explaining the apparent uncertainties of daily practice, was dwelt upon. In the mode of commencing the study of the Profession, the great desirability of not undertaking too much at once, but of doing everything well and the right division of labour, were strongly urged. The value of self-reliance in thought, observation, and practice, and especially of sterling morality and true religion, in promoting earnestness in study and happiness in heart and life were dwelt upon. The stability of moral as well as physical laws, and their certain results were alluded to; and, in conclusion, the lecturer adverted to the influence which one mind must ever exert upon another in the mutual intercourse of daily life and study. The lecturer was frequently applauded during the delivery of his address.

ST. THOMAS'S HOSPITAL.

DR. R. D. THOMSON delivered the address. He pointed out that the science of Medicine had one of the noblest ends in view. By the study of nature's laws it professed to assist in prolonging man's existence on earth, and therefore in

VOL. XL.—No. 1046.—NEW SERIES, No. 484.

contributing essentially to human happiness. He showed that the test of a nation's happiness was not to be sought in riches or conquest, but where an educated, moral, and healthy people existed—there was prosperity and there was longevity—the test of national happiness. True longevity, however, did not consist in the protraction of a few lives beyond the usual allotted span, but in an increase in the average duration of human existence. He combated the popular doctrine that life was uncertain; and argued in support of laws which regulate health and disease, as fixed as those which preside over the movements of the celestial bodies. He referred to the remarkable laws discovered in reference to small-pox and cholera, which enable us to foretell, out of a given number constantly sick, the exact number in each successive day who are to live and to die. From these even the sceptic might learn to believe in the literal interpretation of the Divine aphorism, that not even a sparrow falls to the ground without permission. He briefly alluded to his own experiments on the composition of cholera atmospheres, in which he had found animal life and matter, which may have tended to propagate the disease; and the interesting observations and drawings of his colleague, Mr. Rainey, who had succeeded in artificially producing shell structure, and even starch. He described the nature of ozone, and some of his modes of producing it, and illustrated his remarks by experiments. He concluded his address amid warm applause, by reminding the pupils that they had all a destiny to execute, for the goodness of which they were answerable, and urged upon them the importance of labouring with all their might in their future avocations.

ST. GEORGE'S HOSPITAL.

MR. H. C. JOHNSON addressed especially the junior students, giving them good practical advice as to the course and mode of study, and concluded by some general remarks on the position of the Medical man.

The Medical Practitioner should be proud of his acquirements, as he knew they had been gained by labour, but he should look with a lenient eye at the deficiencies of others, and believe himself not faultless. He should abstain from the angry and violent disputes that sometimes agitated the Profession, the consequences of participation being to make more enemies than friends. He should put aside all personal considerations of wealth and fame, and have always in mind the relations that ought to subsist between himself and those to whom he was administering relief. It might be asked, then, by the student, what was to repay him for his study and self-denial? If rank, honour, or fortune were not open to him, he would be repaid by the gratitude of many to whom he had administered relief, and by the foundation of the closest and most lasting friendships.

He then enlarged on the special advantages of the School he opened for the session, and said:—Let it be said of St. George's Hospital School that which Ammianus Marcellinus said of the Egyptians, that in his time it was enough to secure credit to any Physician if he could say that he had studied at Alexandria.

KING'S COLLEGE HOSPITAL.

The address was delivered by Dr. MILLER, who, after some remarks on the duties of teachers and pupils, the self-teaching of the pupil, and the objects of his special Medical studies, concluded as follows: "And now, gentlemen, let me congratulate you upon the choice of the Profession which you have made. In none are the means of usefulness greater. In none are the objects which occupy its votaries more truly beneficent. The rewards which it holds out to you are not those of high place, commanding influence, or great emolument. It, however, assures to you a competence, if followed with ordinary industry and perseverance; and it brings you into the society of the best and noblest minds. It associates you with those whose lives are spent in the endeavour to do good to others; whilst it introduces you to the cultivated, the refined, and the enlightened, not less than it makes you acquainted with the miserable, the indigent, and the degraded. The Medical man has thus unusual facilities of becoming familiar with the feelings both of the upper and

of the lower ranks of society; and if he use that knowledge aright, how much may he not accomplish in drawing out the sympathies of the wealthy and influential, and directing them into channels and enabling them effectually to aid their poorer brethren? We hear much of the difficulty of bringing the higher classes into contact with the lower in such a manner that ties of kindly feeling shall be strengthened between the two. Surely much may depend upon the mode in which the Medical man uses the knowledge and the influence within his power. May you, when your time comes to take an active part in human affairs, lay this subject to your heart, and may each of you be faithful to the discharge of this, which, believe me, is one of the least of your responsibilities. Self-denial, in no ordinary degree, is indeed required of you in the Profession to which you have pledged yourselves. But if the Profession have its anxieties, fatigues, and disappointments of no common order, so also has it rewards and consolations which few other pursuits afford. To relieve the sufferings of disease, to soothe the couch of anguish, to minister comfort to the dying, are indeed privileges which cannot be estimated too highly. Go onward, then, gentlemen, and may God prosper you in the work of mercy, of benevolence, and usefulness which it has been your happiness to choose as the business of your life." (Loud cheers.)

The above Lectures were delivered on Saturday. The following Schools were opened on Monday:—

GROSVENOR-PLACE SCHOOL.

DR. COCKLE delivered the address, and taking as his subject "Phases in Medicine Past and Present," commenced by drawing a picture of the present sects in Medicine. These he divided into five Schools:—1. The Physiologico-Pathological, or that School which, taking anatomy, physiological experiment, chemistry, and morbid anatomy as its basis, attempts to demonstrate the whole problem of life, and therefrom to teach all the causes and phenomena of disease. 2. The School of Rational Empiricism, which takes as its fundamental principle the mere observation of disease, and of the remedies which are most useful in treatment. 3. The Hygienic School, or that which aims at the prevention of disease by the removal of causes. 4. The Expectant School, or that which, trusting to what is called the curative powers of nature, anticipates the spontaneous resolution of disease, and at most places the patient in the conditions assumed to be favourable to recovery. 5. The Sceptical School, or that which negatives treatment, and aims chiefly at acquiring a knowledge of disease as purely a philosophical study. Having completed this picture, Dr. Cockle next passed in rapid survey the history of Medicine, and showed how all and each of these schools had their origin in the past. Some of his illustrations were very apt. Speaking of the Expectants or Naturists, he said:—"The last section embraces those who distrust our actual therapeutics. It is not that they question the action of Medical agents; for example, that jalap purges, tartar emetic vomits, or that opium narcotises; but they contend that with our organs so delicately attuned, and consequently so liable to perturbing causes of such varied nature, it is impossible to erect a criterion; in other words, that we have no means of distinguishing the exact times and conditions under which such medicines can be successfully employed. Skoda, the distinguished head of the Vienna School, is the great representative of this class. To illustrate his doctrine, therefore, I cannot resist the opportunity of reading you a *resumé* from the pen of Dr. Gallavardin, a French Physician, who recently visited his clinique. He observes, 'That which essentially distinguishes the originality of Skoda from that of all the other clinical observers of Germany, is his scepticism. A doubter so absolute, so fervent, has rarely, if ever, been seen in Medicine; so that with the Germans Skodism is synonymous with Pyrrhonism in Physic. Every year at his clinical lessons he tries, successively, upon his twenty-eight patients, all the medicines, the most vaunted, of the Pharmacopœia. And with what intention think you? Simply to convince his pupils that all these medicines are invariably inefficacious. If, by chance, a prompt and marked amelioration follows the employment of any treatment, he bestows all the honour upon the natural progress of the disease. For instance, a young and very robust man, 19 years of age, entered the Hospital

on May 11, for pneumonia of severe type. On the 13th and 14th Skoda prescribed infusion of digitalis, which produced six evacuations daily. On the 15th he bled. On the 16th the pulse, which was 106 the preceding evening, had fallen to 66. To explain this prompt and obvious modification of the pulse, Skoda thus expressed himself:—"It may be the effect of the bleeding. Such a result has occurred. It may be the effect of the digitalis; that has been, also, observed. But it may equally be considered as due to the natural progress of the disease; for that result has also been seen." This is Skoda's habitual mode of argument—invariably indirect. In this manner he gradually insinuates doubt into the minds of his pupils, and eventually leads them to lose all practical faith! Such is an outline of the Sceptical School." Again, when showing that the true aim and end of Medicine is the cure of disease, Dr. Cockle said:—"The gulf between Physiological Pathology and Therapeutics must be bridged over by clinical observation and experiment, that is to say, by what is known as 'Rational Empiricism.' Simple knowledge of the nature of disease can no more, of itself, suggest the remedy, than can a knowledge of the nature of the rocks and mountains, thrown up by volcanic agency, suggest the mechanical means by which these may be removed, and the barren spot restored to its primeval freshness. Let us test the truth of what I here advance by selecting a few of the best known and homeliest illustrations. Look to the history of the virtues of cinchona bark. The untutored Indian, chance-directed to the healing stream into which cinchona bark had been driven by the winds, found that the stream that slaked his thirst, achieved his cure. And this, to him, was all sufficient. Some reasoning Jesuit traced the pregnant sequence, and added to our therapeutic treasury cinchona bark, one of its richest and most invaluable gifts. Since that poor Indian lived, how many pages have been written, both on the nature of the fever, and the action of the bark! But I would ask whether all this so-called knowledge has afforded one single element of explanation of the simple formula—Bark cures intermittent fever. Take another illustration: A thousand years ago the Arabian Rhazes described the pathology of small-pox so accurately that even now, after this lapse of ages, it scarcely requires retouching. Barely half a century ago the protective power of vaccination was discovered. Was this a deduction from the known pathology of the disease? I will not libel your historical knowledge by pausing for a reply. A country milkmaid, living in some remote district, where small-pox frequently raged in all its fearful intensity, learned from simple observation that if from the udder of the cow a certain pustule were produced upon the hand, immunity was given from disease. No observation could be more simply empirical than this. She related the fact in all its simplicity, to one of our greatest observers. Jenner's intuitive sagacity saw the deep import of the tale. He followed out the experiment in all its simple grandeur, verified it on the largest scale, and bequeathed to suffering humanity, for all coming time, one of its greatest blessings." He concluded an extremely well-delivered address as follows:—"But, in enlisting you into Eclectic ranks, I refer, not to that pseudo-eclecticism that, as it were, mechanically and without reserve selects the latest theory, but that the premises of which, challenged by your intellect, is made your own by right of mental conquest. For pure, indeed, must that system eventually become, which ever tends by the application of a severe logic to eliminate the false—with this admixture, visionary were the attempts to erect true Science—Sisyphus-like, we raise the stone in vain. Be you, then, Eclectics in this, the wider, better sense, ever ready to disarm Prejudice at the altar of Principle. Thus far, gentlemen, our wanderings have gone—at times, in many a devious track—now, o'er quicksands—now, through mists of error; but, ever and anon, discerning in the far distance, reposing on her adamantine basis, the glorious image of Truth inviting the purified and chastened votary to lift the veil that but imperfectly shrouds the effulgence of her face. Gentlemen, I conclude with this exhortation to you,—Lift the veil!"

ST. BARTHOLOMEW'S HOSPITAL.

MR. HOLDEN addressed an overflowing and rather boisterous audience, enlarging upon the grandeur of the objects of Medical study, and pointing out to his junior hearers what they should do and leave undone during their London life,

and giving general directions as to the course of study. He said:—The late Sir Walter Scott had observed that the country doctor was the worst paid and worst cared for animal in existence, with the exception of his horse. Still, with all that, they were the aristocracy of science, and there was not one of those whom he addressed who might not aspire to fill the presidential chair of the Royal Society, now so worthily occupied by Sir Benjamin Brodie. As they passed through the grand hall of the Hospital they had seen the portraits of those who had shed light and lustre upon the institution, and upon the Medical Profession. It should be their ambition to imitate them. The sight of the great worthies of the Profession would, he hoped, stimulate them to rival their renown. They might also take lessons of encouragement from their predecessors of a more recent date, from those who, a few years ago, occupied the benches before him, who went out in the course of the late war, and dying in the Crimea, showed their devotion to their Profession and to suffering humanity. (Cheers.) He hoped, however, that their career would be one of peace—that they would keep the light of science burning, like the Persian fire upon the hill-tops, and that imitating the Grecian youth in the games of old, they would pass on the burning torch from one to another, until the illumination was complete. (Loud cheers.)

CHARING-CROSS HOSPITAL.

MR. R. V. TUSON delivered the inaugural lecture. He dwelt at considerable length on the application of chemistry in its various branches, and, adverting to the recent case of Dr. Smethurst, said the failure which had taken place in the Medical evidence was owing to its misapplication, and was not attributable to any fault in Medicine itself. He dwelt upon the responsibilities and duties of students, expressing a hope that they would not give way to that dissipation which would prevent them from doing their work, and would detract from their character as gentlemen.

THE LONDON HOSPITAL.

MR. CRITCHETT endeavoured to place before his hearers his conceptions of a model student in the various stages of his life, leaving it to each of them to adopt the portions best suited to their peculiarities, and to appropriate such hints as might be profitable and suggestive. Having received the education of a gentleman, an education in which the functions of the body, the mind, and the heart had been actively exercised and developed, in which the sinews of thought had been strengthened, habits of attention and concentration acquired, and respect for the feelings and opinions of those older and wiser than himself inculcated and practised, recognising the practical character of the profession, he commenced the study of the healing art in a School connected with some large Hospital. Three years would have to elapse before he would incur the responsibility of coping with disease, and as a vast field of scientific knowledge was opened over the period, which it would be necessary for him to travel, a gleam from every day of that three years ought to be made to contribute a fair share to the general stock. After some general directions as to the course to be pursued during these three years by the student, Mr. Critchett followed him into professional life, of which he drew a very able sketch, and concluded with some practical reflections which were thoroughly appreciated by the gentlemen to whom they were addressed.

MIDDLESEX HOSPITAL.

MR. HENRY delivered an extempore and very impressive address, which was remarkably well received. He directed his audience to inquire, what qualities had collected the most distinguished men in all professions, in order to see whether there were not some one or more characteristics common to them all. What was it, he would ask, that made Xavier and Schwartz, each in his respective Church the most glorious of missionaries, Luther the most formidable of reformers, Bunyan and Wesley among the most influential of religious teachers? What was it that inspired the courage and foreshadowed the successes of an Alexander, a Hannibal,

a Cæsar, and a Napoleon? What was it that made Cromwell at once the most successful of generals and the wisest of statesmen? What was it that embalmed the memories of Socrates, and Newton, and Milton, and Johnson, and Herschell? What was it that gave the ermine to Eldon, and Thurlow, and Ellenborough? What was it that enabled Arkwright, and Wall, and Stevenson to revolutionise the physical world? What was it that in their own Profession had rendered the names of Sydenham, and Harvey, and Hunter, and Jenner familiar as household words? It was, and it might be taken by the gentlemen before him as a solemn truth, and the history of those men proclaimed it, that they possessed earnestness of purpose. To them life was no plaything—time was no trouble, and so must it be with the students before him, so must it be with the students of divinity and law, so with the soldier, and the merchant, so in every calling in life. Let them come furnished with earnestness of purpose, and they would even overcome defects of early education—they would certainly compensate for the lack of genius—they would give pledges of success, which were the harbingers of greatness. This should be their motto (a wiser one was never given), "Whatever thy hand findeth to do, do it with thy might; work while it is day; the night cometh when no man can work." Now was their day; let them perform their task in that Hospital with diligence and earnestness, and show that they were men of courage. More than 2000 years ago, Socrates proclaimed, in language fitted for all time, "The best man and most beloved of the gods is he who as a husbandman performs all the duties of husbandry. As a Surgeon those of the Medical art in political life have duties towards the commonwealth; but the man who does nothing well is neither useful nor agreeable to the gods." The address was concluded as follows:—"A nobler Profession there is not in the world, for in it your lives may be passed in the essence of that true religion which consists in assisting the fatherless and the widow, and in keeping yourselves unspotted from the world. When that great and good man, Dr. Prout, was told that he had but a few hours to live, he called for pen and paper, and occupied literally some of the last remaining moments of his life in dictating directions for the guidance of complicated cases of disease which happened to be under his care. He did so because throughout a long life he had endeavoured so to live as never to be unprepared to die, and because he was actuated by a sense of duty, such as has so often proved the support of our countrymen in every variety of danger and distress. May duty, then, which actuated him, be our guiding star throughout our career! May this session now commenced prove to all a session of honest work, and, as such, an epitome of our lives; and so persevering in duty, even when Time has shaken us by the hand, and we know that Death is not far behind, it may haply come to pass that at length, when our day, too, has come, and the great dread secret has been revealed, it may then be said of each of us, by those who yet survive, as was said of one of old, 'He was skilful enough to have lived still, if knowledge could be set up against mortality.'"

WESTMINSTER HOSPITAL.

DR. REYNOLDS delivered a very able lecture, pointing out to his hearers that "life" was their study:—At every step in our upward progress towards some height of science, the horizon widened, and with new wonders and new beauties there were new elements of confusion, and they might be baffled by the very largeness of the view. By going onwards they saw beyond some clear and hitherto limiting line. There were depths to which their vision could not penetrate further than to see that they contained, in lavish profusion, wonders and beauties equal to those around them. The summit of yesterday's was but the starting-point of to-day's exertion, and as the circle enlarged in its circumference that the increase lay. The rate of increase has accelerated, and the objects that surrounded them seemed infinite and overwhelming from their largeness, their numbers, and the marvellous intricacy of their construction. Life was too short for them all, and they must choose their path. They must leave much unseen, still more unthought of, and an infinitude unknown. For, as they ascended still higher, they caught glimpses of the far-off sea, the infinite unfathomable unknown, that mighty ocean of

unknown truth that lay beyond and beneath all our knowings, which confounded and wrecked every venturous barque that launched forth upon its mighty waves, that vast waste of water, sometimes dreary and bodeful as the grave, but at others bright and beaming as the sky; sometimes blazing with the sunlight and again silent and sorrowful as the pale light of stars. It is only (said Dr. Reynolds) when we have attained and can look out from some height of science that we begin to know how vast is the unknown, and how compared with it dwindles into nothingness the little that our powers have yet taken in. The mightiest of philosophers felt that he was but as a child gathering pebbles on the shore of that soundless sea. But we have to come down from these heights to every-day life and work—to know how to advance, and rejoice in the vision that each day's scientific progress yields, but, at the same time, to find among the wide fields of scientific fact those principles which shall guide us in the prosecution of our real life-work—the alleviation of the sorrows and sufferings of humanity. These principles you must learn by means beside those of chemical experiments and dissection. You must learn them in the hearts and lives of your fellow-men. You must come to know the meaning of the infant's look, to understand the tone and teaching of its cry. You must appreciate the patience and long-suffering of woman, and the hardihood and rough exterior of man. You must look and see beneath these if you would measure the true degree of their affliction. You must learn to feel with and understand the feebleness of age, and gain all that is required for your ministration to its wants, from those hints which come to you through the failing powers and closing avenues of a soul that has for a long time battled with a world too rough. True sympathy will reveal much to you that science cannot see. Wherever there is life there is your field of study; wherever there is suffering there is your field of work; and truly, to relieve its burden, your spirit must be that of Him whose life was the perfect life, whose presence and word brought peace and health, and into whose work in this world it is our highest aim and highest dignity to enter. (Loud cheers.)

A *conversazione* and distribution of prizes followed the delivery of the address.

ORIGINAL COMMUNICATIONS.

NOTE ON AMPUTATION OF THE PENIS.

By THOMAS P. TEALE, F.R.C.S.

Surgeon to the Leeds General Infirmary.

In the Hospital Report on Amputation of the Penis contained in the *Medical Times and Gazette* of October 1, 1859, there is a short notice of a case, treated by myself in the Leeds General Infirmary, concluding with these words: "The entire penis was amputated; the parts healed, and the *meatus* remained freely open."

To the last words of this notice, now marked in italics, I beg leave to draw the attention of the Profession as bearing testimony to the result of a plan of treatment, which I have many times adopted, during the last five years, with the happiest results. About three years ago my mode of treatment was noticed in one of the journals, but I cannot at present call to mind the particular one in which it appeared. As, however, it does not seem to have attracted the attention of Surgeons, I feel it right to bring this "small affair" of Surgery more prominently forward.

I need scarcely allude to the difficulty in keeping the orifice of the urethra open, which is not unfrequently experienced after amputation of the penis, as it must be familiar to most operators. To obviate this difficulty the following simple plan has been adopted, and, as far as I have observed, invariably with success. After the operation of amputation of the penis has been performed in the ordinary way, a director is introduced into the urethra, and by the aid of a bistoury the urethra and skin covering it are slit up to the extent of about two-thirds of an inch. A single suture is then placed on each side of the slit uniting the mucous membrane to the skin. Perfect patency is thus given to the orifice, which is of a long oval form; and, after cicatrization is complete, there remains a free opening into the urinary

canal. Hereby, the free discharge of urine is secured, without any mechanical aid being required, not only during the days immediately after the operation, but also after the cure is complete.

I have adopted the same plan with equal success in the treatment of obstinate stricture at the glans penis. Cases of this kind are occasionally met with in Hospitals, resulting from the cicatrization of sores within the urethra near its orifice. These strictures are readily relieved by bougies, and, the patient instructed in the use of these instruments, might easily keep the passage open; but he neglects to do so; the disease relapses, and he presents himself again and again at the Hospital. Such cases I have seen permanently relieved by slitting up the urethra to the extent of two-thirds of an inch and uniting the mucous membrane and the skin on each side by a single suture.

ON THE MODE OF EMPLOYING THE HYPODERMIC TREATMENT.

By CHARLES HUNTER,

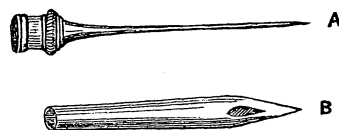

Late House-Surgeon to St. George's Hospital.

THE SYRINGE—ITS EMPLOYMENT; THE TISSUE, AND THE PART OF THE BODY TO INJECT.—THE QUANTITY OF FLUID; DOSE; CAUTIONS.—GREATER EFFECT ON WOMEN THAN MEN.—MEDICINAL ADMINISTRATION BY THE TONGUE AND RECTUM.

In consequence of the polite letter from "Medicus" in this Journal, and numerous others which I have received relative to the employment of the hypodermic treatment, I feel called upon to make the following observations; and firstly with regard to

The Syringe for Injection.—The little instrument I use is made by Messrs. Whicker and Blaise, it is of the same make (but a little larger as regards the barrel) as their original *caustic syringe*. The barrel is of glass, with silver fittings, and contains a piston which works by a screw-rod, each half-turn of which expels half-a-minim, as a fine drop from the end of the pipe.

Two pipes belong to each syringe, the one larger and stronger than the other; the one here figured A is drawn the exact size of the smaller pipe, which will be found the best for general use; it screws on and off the barrel at pleasure, and is made of silver, with a hardened gold point. This point is sharp like a needle, and perforated on one side (as shown in the enlarged view, Fig. B) by the oblique opening through which the drops of the narcotic or other solution, are expelled.

No Incision is required with lancet, or other instrument, when this syringe is used, for the point of the pipe being very sharp and fine, is readily passed, with proper precaution, beneath the skin; no blood is shed, and the operation is no more than the prick of a needle.

The Employment of the Syringe.—Having charged the syringe with the narcotic fluid, hold it in the right hand at the junction of the barrel with the pipe, and with the left hand take up, between the finger and thumb, a fold of the skin of the patient, so as to make tense the part beyond your thumb, then the right hand being gently steadied, but not heavily pressed on the patient, let the point of the syringe, which is held at a right angle to the skin, touch the part which is tense, and, with a *quick but steady movement*, be passed through it; the point being well *through the skin*, the direction of the pipe may be altered so that it may run along in the loose cellular tissue beneath (a); all this is the work of a moment; the pre-arranged number of drops are then introduced by so many turns of the piston, the pipe is then withdrawn, a finger

(a) In the majority of cases the plan above described is best, especially with thin people; if, however, the patient is very fat, it is better to perforate vertically a portion of skin and subjacent fat, pinched up, and so made tense between the finger and thumb.

making slight pressure as near as possible on the punctured spot, the object being both to steady the skin and prevent any drop of liquid escaping; and lastly, a narrow strip of plaster cut beforehand and warmed, is placed on the spot.

The strip of plaster is generally a precautionary measure, but it becomes a necessity when the quantity injected is large, say twenty minims; but it is always useful to prevent the spot from being chafed. A broad piece of plaster is worse than none at all, it presses on the "little lump" which is caused for a few minutes by the presence of the injected fluid beneath the skin, and not at all perhaps on the punctured spot, and so it does more to press the fluid out than keep it in (I have seen a first injection in a case of delirium tremens fail for this very reason); but a narrow strip just covers the punctured spot.

These directions may appear unnecessary, but the operation may fail, as just shown, for want of attention to these little points. If the introduction of the syringe be attempted, the skin of the patient being loose, or the syringe held at the further end, and consequently unsteadily, the patient may by these means be put to a great deal of pain, and the pipe of the syringe may be bent or broken from the socket; but when it is introduced with a quick steady movement, the skin being tense, the patient does frequently not even know when the point is introduced.

The Tissue to Inject.—The tissue injected is the cellular or areolar tissue of the body; it may not matter much whether the cellulo-adipose tissue, the panniculus adiposus, or the reticular tissue beneath it (not containing fat) be injected, but the latter is to be preferred; it is the looser of the two, fluid injected into it meets with no obstruction, and cannot easily escape from it, but if injected into the skin itself, as some think it is, or the conjoined cellulo-adipose tissue, it is apt to cause pain, it enters less readily, and is more apt to escape; nor does it seem to act quite so rapidly as when injected into the loose cellular tissue from which most probably absorption is the more rapid.

The Part of the Body to Inject.—When the object is to quiet the brain, or to produce a general effect, is it material whether the fluid be injected into the cellular tissue of the body or of an extremity? No; the non-necessity of localisation is the basis of this plan of treatment, and is the reason of its applicability in cerebro-spinal affections and general diseases. I need only refer to the various cases detailed in corroboration of this. The site which I, however, most commonly inject, is the inner part of the arm. The skin is here thin, easily made tense, and easily perforated; the cellular tissue beneath is loose, and readily receives the fluid; there are perhaps more veins here than in some other parts, but they are easily avoided.

The Quantity of Fluid to Inject.—It is as well to have the fluid of that strength that three or four turns of the piston shall be an ordinary injecting dose. Two or three turns can be made in a moment of time, and it is no small relief or surprise to the patient, who has been expecting, perhaps dreading, an operation, to find all over in less than half-a-minute.

The Dose.—Too much caution cannot be employed with regard to the amount of the narcotic injected. Two half turns, if your solution is strong, may double the dose, and the life of the patient, for want of due care, be placed in jeopardy; I would, therefore, urge attention to these points:—

1. Be certain of the exact strength of the fluid employed, and the exact value of each turn of the piston.
2. Concerning first injections, never use more than half the ordinary stomachic dose for males, nor more than a third for females.

3. Should a second injection be necessary, let it not be used too soon; nor in a full dose when the patient is partially under the influence of the narcotic.

These points are of practical importance, a certain degree of narcotism has to be reached for benefit to accrue, and by the injection it can be reached in many cases by a very small quantity of the narcotic, because of the rapidity with which the effect is produced, what we have to avoid is too great an effect; what we try to produce is a certain effect with as small a quantity as possible. This leads me to remark that Men bear narcotics much better than women.

I was not aware to what extent this was the case until I had employed this treatment some little while; but I now

think it may be looked on as a rule that men in general will bear with no ill effects, but be benefited by, injected doses of narcotics, which doses would very strongly, if not seriously affect women; in fact, this treatment is a test of the exact amount of a narcotic necessary to produce a desired effect, when taken by direct means into the general circulation. For instance, you introduce beneath the skin the one-eighth of a grain of morphia, the effect which follows is the whole effect of the whole one-eighth; but you cannot be certain that the effect which follows the administration of one-eighth of a grain, firstly, by the skin; secondly, by the stomach; or, thirdly, by the rectum, is the effect of the whole one-eighth; but it is the whole effect of the quantity absorbed.

As by this method we get the whole effect of the known quantity introduced, which we are not sure of getting by the other modes, we have now a method as accurate as that of venous injection (without its dangers) for testing the precise effect of little-known medicines on animals, and the exact doses and effects of well-known medicines on man, of seeing the difference which the sex requires in the dose, and of ascertaining the minimum amount required to produce a desired effect.

It is impossible to say "what amount is to be injected" without knowing the particulars of the case, as well as the sex and age; but taking the acetate of morphia for an example, I think that first injections for adult females should vary from the one-eighth to a quarter or one-third of a grain; for adult males, from the one-sixth to half or three-quarters of a grain.

First injections should be small rather than large, and are good indicators of the amount necessary, should repetition be required. It is true that I have seen used and employed myself much larger quantities than those I have mentioned, for first injections; but the cases have been exceptional, and under close observation.

In the preceding papers on this subject I have shown the advantages of this mode of treatment over the endermic, enepidermic, and stomachic methods, which, requiring longer to act, are less certain and apt to fail completely. Before, however, bringing this paper to a close, I would allude to two other modes of medicinal administration, viz., by the tongue and by the rectum.

1. *Medicines administered by the Tongue.*—Dr. Wardrop has shown (b) that there is a remarkable difference in point of time when medicines are absorbed from the stomach or from the mouth, absorption being most rapid from the latter, and the effect is more regular and more equable. Nor is it difficult to see why,—the medicine absorbed from the mouth is taken directly into the general circulation, but when absorbed from the stomach it has *en route* to pass through the portal system; absorbed from the tongue, the effect is more regular, because the medicine is more certainly absorbed *en masse*.

There is, then, much similarity between the hypodermic and the lingual modes. Rapidity of absorption is the great point in the *modus operandi* of each; and with regard to the effect they both have the advantages of rapidity, greater efficacy, regularity, and equability. Can the one method, then, replace the other? Are they applicable for the same cases and medicines? No; they both have their advantages. Dr. Wardrop's plan is best for the administration of *tasteless* medicines, for calomel, *et hoc genus omne*, but it cannot be used for those medicines which are nauseating and bitter, not, in fact, for narcotics generally, not for cases of delirium, patients refusing medicine, etc., which are the cases where the other plan is most desirable.

2. *Medicines administered by the Rectum.*—This mode of medicinal administration is of great value, and useful as a means both for local and general treatment; there can be no doubt that this method has advantages which the stomachic has not, viz., of greater rapidity of action and greater effect, but the effect is uncertain; this uncertainty of action is not dependent on the mode of introduction, especially if the medicine be used in the liquid form, and employment be made of the graduated syringe invented by Mr. Spencer Wells to regulate the exact amount introduced; but is due to the want of regularity of complete absorption, which cannot be done away with. The rectal method is the more advantageous where the object is to administer the smaller doses of narcotics for affections of the intestinal canal, the rectum, and the parts adjacent

(b) Ranking's Half-yearly Abstract, Vol. xxii., p. 302.

supplied by the great sympathetic, but *most especially* for the speedy introduction of stimuli, and of nutriment in urgent cases, for liquids introduced by this plan have the advantage of being conveyed *simultaneously into both* the portal and systemic circulation; the hypodermic, on the other hand, is the more applicable for those cases where the part, requiring the narcotic, is supplied by the systemic circulation, and is under the influence of the cerebro-spinal nervous system.

Wilton-place, Belgrave-square.

CASE OF EXCISION OF THE KNEE-JOINT.

By EDWARD E. TUCKER, F.R.C.S.

As the case I am about to narrate possesses some statistical value in relation to the above operation, I am desirous to record it.

E. M., 11 years of age, presented the earliest traces of strumous disease in the knee, the result of blows on different occasions in 1853. The disease gradually developed itself, and increased in severity up to the end of 1858. His constitution at this time sympathised greatly with the local affection, and a very rapid deterioration of health rendered an operation imperative.

Excision of the knee-joint having been determined upon, my assistant, Mr. Watterson, speedily put the little fellow under the influence of chloroform, and my friend and neighbour, Mr. Essex, Surgeon of the Pontypool Iron-works, gave me also his most efficient assistance in performing the operation, which included no features of a very unusual character. The disease of the joint proved very extensive. It had penetrated deeply into the head of the tibia, as well as into the corresponding extremity of the femur. About one inch of the latter bone was sawn off, and upwards of an inch of the tibia; the head of the fibula, free from disease, was left entire, projecting considerably above the sawn surface of the tibia. In the attempt to straighten the limb, which heretofore had been kept flexed on the thigh at a very acute angle, I experienced so much difficulty and resistance, that I instantly determined to divide the ham-string tendons on both sides, in preference to using the very considerable force necessary to overcome the excessive contraction of these muscles. It is a proceeding I have had no cause to regret, as it, without doubt, greatly facilitated the after treatment. The patella, slightly diseased, was removed, as well as a portion of the redundant flap below it. The operation being completed, and the wound dressed up, the patient was put into bed. The minute details of the after treatment I need not enter upon; suffice it to say, the case required great attention and care. By the end of February, or two months after the operation, things were going on satisfactorily, the boy's health had greatly improved, and there was every hope of a firm bony union of the severed parts. At no period of his prolonged confinement of eighteen weeks, excepting the first days subsequent to the operation, could I consider his life in danger. He experienced, I might with truth say, immediate relief from severe exhausting pain; his health gradually improved, although the appearance of the wound varied greatly.

The end of the third month showed most favourable progress, inasmuch as, with the assistance of a finger supporting the heel, he was enabled to lift the limb from his bed; but it was apparent that bony union had not taken place. He was, however, permitted to assume a sitting posture. By the end of April firm bony union was accomplished, and he had liberty to move his limb about in his bed as he chose, and finally, at the end of the second week in May, he was out in the open air, on his crutches, greatly enjoying the change of things. His food throughout was of a highly nourishing quality, and he had a pretty liberal allowance of stimulants.

This being the only case of excision of the knee-joint which I have seen, I am quite unable to offer an opinion as to the value which may attach to a division of the ham-string tendons; but I am under the impression that it very greatly contributed to maintain, with my rough self-constructed apparatus, the limb in that perfect state of rest which obtained throughout the greater part of the time of his confinement.

To save this boy's life, an operation was imperative. My practice in these cases hitherto for upwards of twenty years,

has been to remove the limb. My brother-in-law, Mr. John Sharman, of London, who happened to be visiting me, saw the case, and thought it a favourable one for excision, and the parents of the child eagerly seized upon the hope thus held out of saving his limb.

The operation has proved *perfectly* successful. It is rather more than eight months since it was performed, and the boy now, in the middle of September, can run and fly his kite, and even play at leap-frog pretty nearly as well as his brothers.

Aberschyan Iron Works, near Pontypool.

ON THE

INTRODUCTION OF THE CATHETER.

By J. ZACHARIAH LAURENCE, F.R.C.S. M.B. Lond.

Surgeon to the South London Ophthalmic Hospital.

THE late Mr. Liston observes that the introduction of a catheter through an impermeable stricture is "the most difficult in the whole range of surgical operations, and demands all the prudence, science, and skill of a master." It may not therefore be amiss to devote a few reflections to this very common and hence most important operation. The credit and self satisfaction the Surgeon experiences after the successful introduction of an instrument (especially in cases of retention), the relief he affords his patient, are so many incentives to a careful study of the circumstances which must be attended to for the acquisition of this so useful and telling surgical accomplishment. Before actually introducing a catheter, much useful information may be derived by inquiring into the general features of the case in question,—the more so, when it is borne in mind that all the symptoms of stricture may be simulated by other diseases. It would be foreign to my purpose to enter here into the diagnosis of stricture; but may perhaps be permitted to allude to a not uncommon source of "false stricture,"—viz. abnormal conditions of the urine. I not long ago met with a patient who had been supposed, and supposed himself, to suffer from stricture for upwards of two years, and had been treated in accordance with that supposition. Finding that No. 10 passed easily into the bladder, I was led to inquire further into the state of his urine; I found this highly alkaline. The administration of mild mercurial purgatives and mineral acids effected a complete and permanent cure of his "stricture" in nine days. Should organic disease of the kidneys be suspected, the greatest caution and forbearance should be observed in the use of instruments. Some years ago I witnessed an impressive warning of this fact: a Surgeon *would* introduce an instrument into the bladder of a patient suffering from Bright's disease; a fatal shiver ensued, and in four-and-twenty hours the man was dead.

One of the most remarkable characters of this interesting disease is the great variety of aspects it assumes in different cases. The dispositions of different individuals do not vary more than different cases of stricture do. And this leads us to observe that to treat any case well, its character and peculiarities must, in the first instance, be carefully studied and investigated. This acquaintance with stricture is not made all at once; it is only after several interviews with the patient that it is to be acquired, but will subsequently prove most useful in the further treatment of the case. This remark applies especially to those strictures which are complicated with false passages: the situations of these have to be learned to be avoided. When the Surgeon enters upon the treatment of stricture by dilatation, he should commence by introducing a full-sized instrument (No. 9 or 10). If this pass into the bladder, it is evident that any further instrumental treatment would be uncalled for. Either there is no stricture at all, or there is only a potential ("spasmodic") one, depending on some perverted action of the muscular apparatus of the urethra, which itself again depends on some ex or in-trinsic cause of irritation, which it is the Surgeon's problem to find out, and, if possible, remove.

Suppose a full-sized instrument is arrested at some point in its progress onwards to the bladder, does it hence absolutely follow that the patient has an organic stricture? By no means: the presence of the instrument itself may act as a cause of spasm. Should, however, the Surgeon succeed, after

withdrawing the larger instrument, in introducing a less one, he then has pretty conclusive evidence of the existence of an organic stricture. Presuming such to exist, the point of arrest of the full-sized instrument affords most important information—the locality of the obstruction. Any less-sized instrument employed in the further treatment of the case, if arrested short of this point, must be so by being merely caught in some irregularity of the urethral membrane. The Surgeon will thus avoid the risk of making a false passage under the impression that he is dealing with an obstruction which really does not exist. In commencing the treatment of a stricture by dilatation, the patient can generally afford some useful information in the choice of an instrument, either from the size of his stream of urine, or from his previous experience in instrumental dilatation. No rule in Surgery has perhaps been more impressed by writers on stricture, than the caution of avoiding all undue force in the use of the catheter. While endorsing this statement most heartily, I would at the same time remind my readers that there are certain hard gristly strictures, into which it would be impossible to introduce any instrument by merely holding it “like a feather;” but in which a little scientifically directed pressure is absolutely indispensable. This pressure, however, must not be used till the point of the instrument has fairly entered the “mouth” of the stricture: otherwise, a false passage, anterior to the stricture, is all but inevitable. If in a case of this kind the instrument be kept gently pressed against the mouth of the stricture, the mere force of the respiratory movements of the abdominal muscles will be observed to gradually carry the catheter through the stricture into the bladder.

Before concluding these few remarks, I would remark that I have often seen Surgeons exert a good deal of injurious force in a way which has not been duly appreciated, viz. by depressing the handle of the catheter too rapidly and forcibly down to between the patient's thighs, after the instrument reaches the triangular ligament. They seemed to forget that they were thus using a large amount of leverage; the amount of force they imagined they were only using being really multiplied many times by the long arm of the lever (the stem of the catheter). This leverage may, however, if used judiciously, become very usefully available in the introduction of an instrument through a stricture.

MOVEMENTS OF THE SOFT PALATE IN DEGLUTITION AND SPEAKING.—In a female, under Prof. Schuh, a tumour in the left nostril had destroyed the septum of nose, separated upper maxillary bones, so that after its extirpation there remained an enormous opening, giving a clear view of the palate, the bottom of pharynx, and the orifices of the Eustachian tube. She was the subject of the following observations:—Deglutition. When a glass was brought to the mouth, the soft palate was raised above the horizontal, and completely closed communications with the nose. It remained in this position as long as the liquid flowed into the mouth; but at the moment of deglutition, it was suddenly depressed, and became invisible, aiding in the descent of the liquid into the pharynx; it then rapidly again ascended, even a little higher than before, and was more tense in order to close the passage into the nasal fossæ. The deglutition of solid food was accompanied with like movements, only there was wanting the first elevation of the palate, in consequence of there being no suction. The angle made by the posterior surface of the palate when raised with the flow of the nostrils at the last moment of deglutition was from 10° to 15° .

M. BEHIER calls the attention of the Medical Hospital Society of Paris to the use of large doses of opium as arresters of hæmorrhage. Rhatany, and perchloride of iron had been tried in vain in two cases of tubercle; and then M. Behier comes in with his opium. Not only did the large doses of opium, he says, arrest the hæmorrhage, but the patient's condition was much improved afterwards. This is the old tale over again; assuming as positive facts consequences which follow antecedents; the jumbling together of *post hoc* and *propter hoc*. Surely M. Behier need not be told that in nine cases out of ten, hæmorrhage from the lungs of phthisical patients will cease spontaneously; and that the condition of such patients is almost invariably temporarily relieved by hæmoptysis.

THE LONDON AND PROVINCIAL PRACTICE OF MEDICINE AND SURGERY.

STATISTICAL REPORT ON THE RESULTS OF TRACHEOTOMY.

In the following report we purpose to bring before the reader a general summary of all the Tracheotomy Cases recorded in our Hospital statistics during a period of about five years. We shall have the pleasure of being able to cite the particulars of nearly ninety cases, respecting most of which fair circumstantial details are in our possession. A few cases of laryngotomy will be included, but they are comparatively very few. It will be convenient to classify the cases according to the nature of the disease requiring the operation, and we shall therefore subdivide them under the following heads, —1st. Tracheotomy for Laryngeal Disease, not including True Croup; 2nd. Tracheotomy for Scalds of the Glottis; 3rd. Tracheotomy for Croup; 4th. Tracheotomy for Foreign Bodies in the Trachea; and 5th. Tracheotomy for various affections not included in the preceding groups. On bringing to a conclusion our citation of facts, we shall arrange the cases in tabular juxtaposition, and proceed to analyse the whole, and to offer such comments as may appear required.

FIRST GROUP. TRACHEOTOMY FOR LARYNGEAL AFFECTIONS

(EXCLUSIVE OF TRUE CROUP).

In this Group we have thirty-seven Cases, of which seven resulted in recovery, and twenty in death. In a considerable number of them (eighteen cases) the disease requiring the operation was syphilitic laryngitis, and these appear to have afforded a fair proportion of recoveries (eight out of eighteen); while, however, in not a few the canula was permanently needed. Of the fatal cases, in several death occurred during the operation (Cases 9, 32, 35, and 36). In one instance the immediate cause of death was hæmorrhage into the trachea, caused during the attempt to remove Dr. Marshall Hall's tracheotome from the wound. In almost all the cases in this class the patients were adults, and in several they were past middle age.

ST. BARTHOLOMEW'S HOSPITAL.

(Under the care of Messrs. STANLEY, LLOYD, SKEY, PAGET, etc.)

Case 1.—A woman, aged 44, was admitted, under the care of Mr. Stanley, for syphilitic disease of the larynx of two years' duration. Tracheotomy was performed on account of threatening suffocation. She did well: the wound healed, and in three weeks she left the Hospital.

Case 2.—A beadle of the Hospital, aged 32. Laryngotomy was performed for oedema of the glottis supervening on acute tonsillitis. A considerable portion (about three-quarters of an inch) of the uvula had been removed the previous day, which gave considerable relief to the dyspnoea. Acute laryngitis set in about two hours after, for which he was freely bled and leeches. The depletion was followed by decided improvement for a short time; but about four hours after the dyspnoea returned with great severity, and the man fell back apparently dead. Mr. Chippendale at once performed laryngotomy, and then had recourse to artificial respiration, which was maintained for more than ten minutes before signs of returning animation appeared. It was necessary to continue it for some time longer, as the natural respiration was unable to go on without it. It was estimated that two minutes elapsed from the time the man fell back and ceased to breathe, to the time the operation was performed. For some time the patient continued in a precarious state, but he ultimately recovered, and the wound closed in a fortnight.

Case 3.—A man, of middle age, was admitted, under the care of Mr. Lloyd, on account of syphilitic ulceration of the larynx. Most urgent dyspnoea having supervened, tracheotomy was performed by Mr. Jowers, House-Surgeon. At the time of its performance the man was all but asphyxiated, and

although it occupied but very little time, yet before its completion he was to all appearance dead. Artificial respiration was resorted to, and had to be continued for two hours before it was safe to abandon it. Injections of brandy and beef-tea were, during the time, thrown into the rectum. As far as the respiration was concerned, the operation was successful the relief afforded being permanent. The patient, however, sank and died from exhaustion four days afterwards.

Case 4.—A man, aged 66, was admitted on account of acute inflammation of the tonsils and much œdema of the pharynx and neighbouring parts. Punctures were made with some relief, but the symptoms increasing laryngotomy was performed two hours afterwards. Death took place on the third day. The autopsy revealed purulent œdema round the glottis, and purulent infiltration of the lungs.

Case 5.—B. H. was admitted, April 1, for typhoid fever. On the morning of the 16th his breathing became rapid, and he was paler and more exhausted than usual. In the afternoon the respiration had become decidedly laryngeal and hoarse, and there was extreme debility. Towards evening the man was evidently sinking from suffocation, when tracheotomy was decided on and performed by Mr. Chippendale. The relief to the breathing was most marked and immediate, and shortly after the introduction of the tube the boy went to sleep. He continued to improve, until the morning of the 17th, when the respiration again became rapid and embarrassed. He died twenty-seven hours after the operation. At the autopsy there was found a slough in the mucous membrane of the larynx about the size of a fourpenny-piece. The post-mortem also revealed another peculiarity. The left carotid artery was, in this case, given off from the innominate, and crossed the trachea within two-thirds of an inch from the lower end of the incision, which latter had been made from the third to the sixth ring, inclusive.

Case 6.—M. W. was admitted on October 8, under the care of Dr. Jeaffreson, on account of symptoms of acute laryngitis. She was a prostitute, and confessed to having had syphilis fourteen years ago. She stated that she never had cough, and that nine weeks ago she first noticed that she was hoarse, and that the throat had been sore for four weeks. She was bled twice: the first time to xxxiv . with great relief, the second time to xxvii . which again relieved her. Blisters, mercurial inunctions, and the internal administration of calomel, were also used. On the third day after admission she was very much reduced. The dyspnoea was increased. The mouth being now affected, the mercury was omitted. Stimulants were given. She slept during the earlier part of the night, but towards morning the dyspnoea was much aggravated; her face became livid, and suffocation seemed impending. Tracheotomy was, therefore, performed by Mr. Skey, jun. The utmost relief was afforded by the operation. She improved steadily. On the tenth day after the operation, the canula was withdrawn, but her breathing by the larynx was found to be as difficult as ever. It was therefore replaced. The last note says, "There seems every probability that she will wear it permanently."

Case 7.—A sailor, a stout muscular man, aged 28, was admitted at 5.30 a.m., suffering from intense dyspnoea, which had come on during the night. Two days previously he had been locked up all night in a police cell for drunkenness. He had had a slight pain in the larynx, which did not prevent his going about. He went to bed at 10.30 the night before admission, without any difficulty at all in his breathing, and awoke at 5 a.m. with a feeling of suffocation. Leeches were applied to the throat, and blood taken from the arm. This gave him temporary relief, but the urgent symptoms having returned tracheotomy was performed by Mr. Morris, the House-Surgeon, with immediate relief. He progressed most favourably for ten hours, when he was seized with a fit of delirium and suddenly expired. Post-mortem examination showed the epiglottis to be in a state of slough, with serous effusions in the surrounding cellular tissue. There was emphysema of the cellular tissue of the posterior mediastinum and compression of the lungs.

Case 8.—A man, aged 26, under the care of Mr. Paget for syphilitic disease of the larynx. He had suffered during the day from several very urgent paroxysms of suffocative dyspnoea, and, for fear of their recurrence at a time when assistance might not be at hand, Mr. Paget advised the man to submit to tracheotomy. This was accordingly done, and

for some days he appeared relieved. Broncho-pneumonia, however, subsequently occurred, and carried him off about the eleventh day. No post-mortem was permitted. There has reason to suspect extensive tuberculous disease of the lungs.

Case 9.—A man, aged about 55, was admitted, suffering from laryngitis which threatened suffocation, and which, according to the account given, had only commenced a few hours before. The urgency of the symptoms being rapidly on the increase tracheotomy was decided on. At this time he could not speak, and every minute threatened to be his last. Whilst the preparations for the operation were being made he ceased to breathe, and although Mr. Lloyd proceeded immediately to its completion it was not afterwards found practicable to rally him. Artificial respiration was tried. At the autopsy great œdema of the submucous tissue of the glottis was found.

Case 10.—A delicate woman, aged 53, was admitted under care of Dr. Jeffreson, for chronic laryngitis of six weeks' duration. She had been repeatedly leeches and blistered. As the dyspnoea had become urgent, tracheotomy was performed by Mr. Chippendale a few hours after admission. For four days she progressed very favourably, but on the fifth day profuse diarrhoea having set in, she died. On post-mortem examination, the margins of the wound were seen to be healthy, but suppuration had extended downwards along the left side of the trachea to the space between it and the œsophagus involving also the posterior œsophageal fascia as low as the fourth dorsal vertebra. The loose cellular tissue of the mediastina was distended with air. The left lung was partly collapsed. The pleural sac contained turbid fluid and was lined with lymph. The lower lobe of the right lung was in a state of grey hepatization. The mucous membrane of the trachea below the opening, which had been made from the fourth to the eighth ring, was much congested and presented some small patches of sloughing ulceration. The larynx and that portion of the trachea above the wound was perfectly healthy, but the mucous membrane of the glottis was wrinkled as if it had been œdematous.

Case 11.—A woman, aged 31, was admitted on account of syphilitic ulceration of the larynx and pharynx. Great difficulty of breathing existed, and it gradually increased to such an extent that tracheotomy had to be resorted to. Inability to swallow afterwards occurred, and the patient required to be fed with the stomach-pump. Death from exhaustion took place seven days after the operation.

ST. THOMAS'S HOSPITAL.

Case 12.—A girl, aged 17, was admitted for acute laryngitis. Death from asphyxia being threatened, the House-Surgeon, Mr. Williams, performed tracheotomy. Recovery resulted, and the tube was removed on the eighth day.

Case 13.—A man under care for syphilitic disease of the larynx. He had been under treatment for several days, when dyspnoea became so urgent that tracheotomy was performed by Mr. Ord, the House-Surgeon. Immediate relief was obtained, and the man at the last report, three weeks after the operation, was doing well, but still unable to dispense with the tube.

Case 14.—A woman, aged 26, was under care for what was believed to be syphilitic disease of the larynx. Asphyxia being imminent, the trachea was opened by Mr. Williams, the House-Surgeon. She recovered well. The tube was still needful at the date of the last report.

KING'S COLLEGE HOSPITAL.

(Under the care of Dr. TODD and Mr. FERGUSON.)

Case 15.—A man, aged 40, was admitted, under the care of Dr. Todd and Mr. Fergusson, on account of syphilitic ulceration of the larynx. There had been no loss of voice for some months. The dyspnoea, which had been increasing for three days, became so urgent that tracheotomy was performed. The patient recovered.

Case 16.—A woman, aged 42, was admitted on account of syphilitic laryngitis. During a relapse she became reduced to a condition of such imminent danger from suffocation, that tracheotomy was performed by Mr. Tutin, the House-Surgeon, in charge of the case. Very great relief was afforded by the operation, but she died from exhaustion on the fourth day. There was great pulmonary congestion.

THE MIDDLESEX HOSPITAL.

Case 17.—A woman, aged 30, was admitted, on account of chronic laryngitis. Suffocation being imminent, laryngotomy was performed by Mr. Cribb, the House-Surgeon. The operation was attended by complete relief. The patient up to the date of the last report still wore the canula, and was unable to breathe without it.

THE WESTMINSTER HOSPITAL.

(Under the care of Dr. FINCHAM.)

Case 18.—A woman, aged 39, was admitted, under the care of Dr. Fincham, on account of syphilitic disease of the larynx, which had existed for nearly five years. There was also extensive ulceration of the pharynx. She was very cachectic; the respiration was rapid, the pulse quick, and the swallowing very difficult. Her symptoms increased in severity, and the third day after admission tracheotomy was performed, she being at the time *in articulo mortis* from suffocative dyspnoea. When the tracheal tube was introduced, so much muco-purulent fluid escaped as to suggest to some present that an abscess had been opened. Brandy and ether were administered, and she quickly rallied. On the following day she swallowed easily, and the respiration had become much slower. Mercury was afterwards given, and a steady improvement followed. Six days after the operation the tube was coughed out, and it being found that she could breathe comfortably, it was not replaced. The wound healed quickly, and she left the Hospital quite well.

ST. GEORGE'S HOSPITAL.

(Under the care of Mr. TATUM.)

Case 19.—A man, of middle age, had suffered from threatening attacks of suffocative dyspnoea in connexion with chronic disease of the larynx. As a precautionary measure the larynx was opened by Mr. Tatum. The tube was used for a few days and then removed. The wound healed, and the breathing was much more comfortable.

THE LONDON HOSPITAL.

Case 20.—A boy, aged 12, under care for phthisis, became affected with inflammatory oedema of the glottis. When in a state of very perilous dyspnoea, and when he appeared to be fast sinking, tracheotomy was performed by Mr. Corner, the House-Surgeon. Immediate and very great relief was obtained, but death from exhaustion occurred on the third day. The autopsy showed extensive oedema of the glottis, pharynx and soft palate, and much tuberculous disorganisation of the lungs.

Case 21.—A man, aged 40, who had been frequently an inmate for extensive syphilitic disease of the pharynx and palate, was brought into the Hospital all but dead from laryngeal obstruction. Mr. Thornhill, the House-Surgeon in charge, at once performed tracheotomy, and afterwards resorted to artificial respiration. The latter was continued for nearly three-quarters of an hour before the patient recovered. He did, however, ultimately rally, and was sufficiently restored to be able to write on a slate, "I feel all right now." The instrument used was Dr. Marshall Hall's tracheotome. During the urgent symptoms it had been left in the wound. The operator now attempted to substitute for it a canula, and to withdraw the blades; in doing so, however, hæmorrhage was caused, probably from wound of part of the thyroid body; the blood flowed into the trachea, and almost immediate death ensued.

Case 22.—A woman was admitted in an advanced stage of phthisis with laryngeal disease. Death from suffocation was threatened, apparently from impediment in the larynx, and tracheotomy was accordingly performed by Mr. Debenham, the House-Surgeon. An enormous quantity of semi-purulent fluid was brought up through the canula, and some relief was afforded. Death, however, followed thirty-six hours after the operation. At the autopsy, in addition to extensive disease of the lung, much inflammatory thickening of the mucous membrane of the larynx was found. There were also two small ulcers beneath the chordæ vocales.

ST. MARY'S HOSPITAL.

(Under the care of Dr. CHAMBERS and Mr. LANE.)

Case 23.—A man, aged 55, under the care of Mr. Lane on account of chronic laryngitis of eight months' standing, laryn-

gotomy was performed by Mr. Lane. The patient recovered well from the operation, but subsequently died of phthisis.

Case 24.—Mr. James Lane performed tracheotomy on a patient of Dr. Chambers suffering from chronic laryngitis, the symptoms of obstruction having become urgent. The operation was quite successful. The wound was afterwards allowed to close. About a month later, urgent dyspnoea having again set in, a second operation was performed by the House-Surgeon, Mr. Ormerod, who selected a part a little below the original wound. The man again did well.

Case 25.—A man, aged 45, was admitted with acute laryngitis. Tracheotomy was performed by Mr. Heath, the House-Surgeon. The operation afforded great relief to the respiration, but death took place on the fourth day.

UNIVERSITY COLLEGE HOSPITAL.

(Under the care of Mr. ERICHSEN.)

Case 26.—A man, aged 32, under the care of Mr. Erichsen. Laryngotomy was performed on account of chronic syphilitic disease of the larynx threatening suffocation. Recovery.

GUY'S HOSPITAL.

Case 27.—A woman, aged 26. She had been under treatment for syphilitic ulceration of the larynx of two years' duration. Urgent symptoms of impending suffocation having presented themselves, Mr. Barker, one of the dressers, performed tracheotomy. She was much relieved, but death from bronchitis followed ten days afterwards. The tube had been retained throughout.

Case 28.—A man, aged 30, was admitted on account of obstructive disease of the larynx. His dyspnoea gradually increased until, under the most urgent circumstances it became necessary to perform tracheotomy. The operation was performed by Mr. Callaway, with immediate and great relief; but the patient died from bronchitis on the third day. At the autopsy, in looking downwards into the larynx, the rima glottidis was seen to be completely occluded by tumefaction. On cutting it across, this was found to be caused by an abscess capable of holding half a walnut in the posterior part of the larynx. In the matter contained in it one of the arytenoid cartilages lay quite detached. There were also evidences of inflammation of the trachea and bronchial tubes, and in the mucous membranes of the latter were numerous very small abrasions or follicular ulcers. The man had an eruption of the skin, which was thought by some to be syphilitic, but there was no ulcerative disease whatever about the larynx.

Case 29.—A woman, aged 44, was admitted on account of syphilitic laryngitis. The disease had existed five weeks. She was almost *in articulo mortis*, when tracheotomy was performed by Mr. Daniell, the House-Surgeon. She was with difficulty revived after the operation, but subsequently did well and made a rapid recovery.

VARIOUS PROVINCIAL HOSPITALS.

Case 30.—The Liverpool Royal Infirmary.—A man, aged 33, under care on account of chronic laryngitis. The thoracic organs were healthy. Suffocative obstruction supervened rapidly after the use of a strong solution of caustic, and tracheotomy was necessitated. The operation was performed by Mr. Halford. The man recovered well, but still wore the tube when he left the Hospital.

Case 31.—Kent and Canterbury Hospital.—A girl, aged 17, under care on account of anæmia, etc. Two months after admission she began to suffer from sore-throat. The right tonsil became immensely enlarged, and all but occluded the pharynx. No soft part could be felt in it; and although several deep punctures were made, no matter was obtained. On the third day laryngotomy was performed, the dyspnoea having become so urgent as to threaten suffocation. No tube was introduced, the space being found too small. Marked relief followed the operation. The wound healed in about a week, the swelling having meanwhile much decreased. The abscess did not give way until three weeks after the first symptoms, when about half a pint of greenish well-formed pus was brought up. Recovered.

Case 32.—Kent and Canterbury Hospital.—A man, aged 66, under care on account of albuminuria, was suddenly seized with laryngitis. The symptoms having become urgent, laryngotomy was resorted to; but it was too late, and death took place before the operation was completed.

Case 33.—The Derby Hospital.—A young woman, aged 22, was admitted under the care of Mr. Gisborne, with syphilitic laryngitis. Paroxysms of severe dyspnoea occurred, and during one of these, as death appeared imminent, tracheotomy was performed by the House-Surgeon. She was cold and pulseless at the time, and subsequently died of bronchitis.

Case 34.—Royal Berkshire Hospital, Reading.—A young woman, aged 20, was admitted under the care of Mr. Bulley. The previous history was, that she had suffered for two days from sore-throat, but went to bed the evening before admission otherwise in good health. She awoke in the morning in a state of apparently impending suffocation, and was at once sent to the Hospital. Laryngotomy was immediately performed, and with great relief. The canula was worn for the next twelve days and then disused. The wound, which had been very unhealthy for some time, healed in about ten weeks. She was a red-haired unhealthy girl, of flabby appearance, and it was only by the most liberal use of stimulants that her recovery was obtained. The attack appeared to have been one of oedematous laryngitis, and she suffered during the illness from congestion of the lungs. Four months after the operation she had not regained the perfect use of her voice.

Case 35.—Staffordshire General Hospital.—A woman, aged 38, was admitted on account of ulceration of the larynx, with warty growths. The disease had existed for nine months, and was suspected to be syphilitic. Several paroxysms of most threatening dyspnoea had occurred, and in one of these Mr. Moreton, House-Surgeon, proceeded to perform tracheotomy. The breathing having ceased altogether, the more speedy operation of laryngotomy was preferred, and the trocar and canula were at once thrust through the cricothyroid space. Artificial respiration was immediately resorted to, and galvanism used, but with no avail. At the autopsy a cluster of warts, with surrounding ulcerations, were found immediately above the bifurcation of the trachea, and almost occluding that tube.

Case 36.—Bristol General Hospital.—A woman, aged 25, was admitted for syphilitic ulceration of the larynx. She was moribund on admission, and, although tracheotomy was at once resorted to, she did not rally. At the autopsy a small piece of carious bone was found in the laryngeal pouch.

Case 37.—The Dundee Infirmary.—A man, aged 36, was in a state of impending suffocation from syphilitic disease of the larynx. Tracheotomy was performed, and with temporary benefit, but death took place in fourteen hours. No autopsy.

SECOND GROUP.

TRACHEOTOMY FOR SCALDS OF THE GLOTTIS.

All the Cases in this Group have, of course, young children for their subjects. It would appear that the age liable to the accident of scalded glottis is between twelve months and five years. Children under the age of a year are unable to accomplish the feat of drinking from the kettle-spout, and those upwards of five are too sensible to attempt it. It might have been supposed that this extraordinary form of accident would occur with extreme rarity; but, as will be seen, we are able to adduce fourteen examples of it. Of these fourteen cases, eleven ended in death, and only three in recovery. In one the fluid was heated oil, but in all the others it was boiling water from the kettle. Nearly all the little patients were between two and three years old, three or four only being above or below those limits of age.

GUY'S HOSPITAL.

(Under the care of Mr. BIRKETT and Mr. CALLAWAY.)

Case 38.—A child, aged 3½ years, was admitted under the care of Mr. Birkett, having attempted to drink boiling-water from a kettle. The trachea was opened on account of very distressing dyspnoea about seven hours after the accident. During the operation the child all but died from suffocation. During the following week it progressed very favourably, and appeared to be quite out of danger, when rather suddenly symptoms of inflammation of the lungs set in. Death occurred on the fourteenth day. The post-mortem examination showed acute pneumonia.

Case 39.—A boy, aged 3, was admitted under the care of Mr. Callaway, on account of laryngitis, consequent on having

attempted to drink from a kettle. Eighteen hours after the accident it became necessary to open the trachea. The child was then almost dead, and the operation had to be performed hurriedly. There was probably hæmorrhage from some wounded veins. The child did not rally from the collapsed condition in which it was, and death occurred about nine days after the operation.

Case 40.—An unhealthy infant, aged 1 year, under the care of Mr. Callaway. Its history was peculiar. The mother stated that it had attempted to drink from a kettle, and in so doing had scalded its mouth, but not as it was thought seriously, as it continued to play about for three or four hours subsequently. Symptoms of laryngitis then began to present themselves, and soon became very pressing. When admitted the dyspnoea was extreme. Tracheotomy was performed, and with the greatest relief. No bad symptoms subsequently occurred. The canula was kept in for six days. The wound healed perfectly.

Case 41.—A boy, aged 3, under the care of Mr. Callaway, on account of scalded throat. Tracheotomy was performed about seven hours after the accident, under very urgent circumstances. The dyspnoea was at once relieved. The canula was retained for five days. The child recovered without a bad symptom.

Case 42.—A male child, aged 2½ years, was admitted under the care of Mr. Birkett, for scald of the throat, caused by attempting to swallow boiling-water. Suffocation was impending at the time of his admission, seven hours after the accident. The child had previously been healthy, but was only just recovering from whooping-cough. Mr. Birkett performed tracheotomy, using a hook and a scalpel, and then introducing the canula by means of a blunt-pointed or pilot trocar. The tube was retained three days. The child recovered without drawback, excepting that the whooping-cough returned. Some of the paroxysms of cough were so severe as to threaten suffocation. He left the Hospital quite well, the wound being soundly healed, in about three weeks.

THE LONDON HOSPITAL.

Case 43.—A child, aged 16 months, was admitted, after having swallowed some boiling oil. Intense dyspnoea having rapidly supervened, Mr. Debenham, the House-Surgeon, at once opened the trachea. Great relief was at first afforded, but the difficulty of breathing soon afterwards returned, and death took place twenty-four hours after the operation. At the post-mortem examination the epiglottis was found charred and shrivelled, and there was great oedema of the parts about the glottis.

Case 44.—A child, aged 4, was admitted, reported to have attempted to swallow boiling water five hours previously. Leeches were at first applied, but the dyspnoea becoming very urgent, Mr. Wordsworth performed tracheotomy about an hour after admission. Great relief was afforded, but after some hours the difficulty of breathing returned, and death took place fifty hours after the operation. The post-mortem examination showed charring of the glottis and epiglottis, collapse of parts of the lungs, but no extension of inflammation to them.

Case 45.—A stout, healthy child, aged 2½ years, was admitted on account of urgent symptoms, after drinking boiling water from a kettle. She was admitted an hour and a-half after the accident. Tracheotomy was performed by Mr. Sharman, House-Surgeon; all did well for the next four-and-twenty hours, when symptoms of acute bronchitis set in, and death followed eighteen hours later. At the autopsy the larynx only was examined: its mucous membrane was found inflamed, and so swollen as to obstruct the passage of the rima glottidis.

ST. GEORGE'S HOSPITAL.

Case 46.—A girl, aged 5, was admitted on account of scald of the throat. Tracheotomy was performed, but the child only lived a few hours.

ST. BARTHOLOMEW'S HOSPITAL.

Case 47.—A child, aged 3 years, was admitted after having attempted to swallow boiling water from a kettle. The pharynx, tongue, and glottis, were extensively scalded, and there was great dyspnoea at the time of admission. Soon afterwards the symptoms became so extremely urgent that tracheotomy was performed by Mr. Furnivall, the House-

Surgeon. On opening the trachea, the cough became so violent, that it was with difficulty that the canula was introduced. This was, however, accomplished by holding away the edges of the wound by retractors connected behind the neck by an elastic band. The child was relieved by the operation, and fell asleep. The breathing continued tranquil until noon the next day, sixteen hours after the operation, when acute bronchitis set in, and death followed in eight hours more. The autopsy showed great œdema of the tissues about the glottis, much thickening of the epiglottis, and a scald of the pharynx and tongue. The right lung was fixed by pleuritic bands, and its lower lobe was hepatized. The lining membrane of the trachea was inflamed, and the bronchial tubes contained much muco-purulent secretion.

STAFFORDSHIRE GENERAL INFIRMARY.

Case 48.—A child, aged 2, was admitted for scald after swallowing boiling water. Suffocation appearing imminent, tracheotomy was performed by Mr. Moreton, the House-Surgeon. Great relief to the breathing followed, and for two days the child did well. Death, however, occurred on the fourth day. The autopsy showed acute softening in the right lung, and some surrounding inflammation about its root.

THE MIDDLESEX HOSPITAL.

Case 49.—A female infant, aged 2 years, was admitted on account of scald of the mouth and fauces, from drinking from a tea-kettle. Symptoms of laryngeal obstruction rendered tracheotomy necessary, which was performed by Mr. Carver, the House-Surgeon. The symptoms were relieved, but death followed, from exhaustion, thirty hours after.

ST. MARY'S HOSPITAL.

Case 50.—A healthy boy, aged 3, was admitted, under the care of Mr. Spencer Smith, having attempted to swallow some boiling water the night before. The symptoms being urgent, tracheotomy was performed seventeen hours after the accident. Although much immediate relief was given, yet death followed forty-six hours afterwards. At the autopsy, the epiglottis was found thickened, and, together with the uvula and neighbouring folds of mucous membrane, coated with lymph. The mucous membrane of the trachea was much inflamed, and the lungs congested.

KING'S COLLEGE HOSPITAL.

Case 51.—A healthy boy, aged 3½ years, was admitted for scald, from swallowing some boiling water from a kettle-spout. Tracheotomy was performed by Mr. Atkinson, the House-Surgeon, twelve hours after the accident, the child being at the time unable either to speak or to swallow. To subdue subsequent inflammation, calomel was prescribed, and, unfortunately, produced salivation. On the fifth day the canula was removed, and from that time until death the respiration was almost natural. Death appeared to be from exhaustion. There was a large sloughing ulcer in the left cheek. At the post-mortem examination, the larynx was found to be quite recovered from the inflammation, and there was no evidence of bronchitis.

MOST writers on Intestinal Hæmorrhage in Typhoid Fever—Bretonneau, Chomel, Louis, etc.—have considered it as a very dangerous symptom. Dr. Graves, of Dublin, however, offers a totally opposite opinion, considering the sign as rather favourable than otherwise, provided the loss of blood were not extreme. This opinion of an authority like Dr. Graves, M. Trousseau informs the world, at first astonished him, and then set him a thinking; and then he recollected cases of typhoid fever in which the patients were cured after hæmorrhage, and during seven years he had only known two deaths occur through such hæmorrhage. Other of his patients attacked with intestinal hæmorrhage not only recovered, but generally were better afterwards. Dr. Ragaine in his memoir sent to the Academy, relates of 115 cases of typhoid fever—of these eleven suffered from hæmorrhage, and they all recovered. Might not the anti-venesectionists of the present day, take a hint from this fact—if true fact it be? Here in a purely adynamic disease—in typhoid fever—large hæmorrhages are not only supported by the constitution, but the patient appears to be actually relieved by them! Yet with dozens of such facts before them, how boldly do we dogmatise, and boldly lay down systems of treatment!

NOTES AND QUERIES.

He that questioneth much shall learn much.—Bacon.

No. 358.—TREATMENT OF ASCARIDES.

SIR,—I have already called the attention of your readers to this subject; and I trust you will allow me to do so again. I think we are disposed to under-estimate the importance of the malady in question; for to judge from my own experience, I should say that there are a very great number of individuals who are tormented by these animals. One cannot help thinking, that if only one tithe of the high scientific powers which are daily exercised in the investigation of all sorts of incurable diseases, were exerted upon this, that a discovery of real value to humanity would almost infallibly result. Here is a complaint, which *à priori*, we have a right to conjecture is a curable complaint, and yet it is one which numbers of individuals are subjected to from infancy to old age. I must say that I have really been surprised, since looking into the matter, to find how many persons are infested and tormented by these wretched creatures. It is curious that the greatest authority on this subject, Küchenmeister, appears to have been all his life troubled with the animals in question—a fact which may lead people to the idea that their eradication is impossible. Now, it seems to me to be very evident, that if ever we are to arrive at their complete removal, two facts in the history of these animals must be ascertained; and these two facts I can nowhere find satisfactorily told. I therefore conclude that they should be the special objects of study with those who desire to investigate this subject. The first is, What is the actual seat of the ascarides,—how high up in the intestines do they live and breed? It is truly surprising to find how little really is known upon this point; though on consideration of the fact, that in post-mortem examinations the investigation of the subject is usually altogether neglected, we have a ready explanation of the circumstance. We want to know then, first: Do these animals live and breed higher up in the intestine than our injections, etc., per anum, can reach? Are the ova deposited high up, and the animals developed as they pass down, making their presence known only in the rectum? Or, again, do they live and breed and are developed only in the rectum? If these animals' ova are deposited high up in the intestine, then we may conclude that remedies applied per anum can only give temporary relief by removing those of the animals which are present in the rectum. But if it be shown on close study of their natural history, that they live and breed only in the rectum, then we have to investigate why it is that remedies are in so many cases inefficacious for the cure. We want also to have a remedy shown which, while it is destructive to the ascarides, is at the same time harmless as regards the intestinal walls. These are all points which scientific investigation has yet to make clear, but which are yet clearly points about which it may be exercised with every prospect of yielding a most happy harvest of facts. Does the thick mucus, which is so readily thrown out by the irritated mucous membrane of the rectum, form a cover or *nidus* for the ova, protecting them against the destructive influence of injections? Or, again, may not the ova of the animals (if their actual and only *habitat* be the rectum) be deposited beneath those large folds of mucous membrane which encircle the lower portion of it in particular, and so in great part escape altogether the action of injections, unless when large quantities are thrown into the gut, so as to distend it completely? Every day we see in the scientific journals accounts of a certain cure for ascarides; but the fact, which I started off with, viz., that numbers of individuals have been all their life the subjects of these worms, and cannot get rid of them, proves that the right cure has yet to be found. I think I have, above, proposed two questions, which if answered, will most assuredly either give us a certain cure in all cases, if a cure is attainable by injections; or will show us, what is now-a-days denied, that we must try to attack the animals by remedies administered through the mouth.

No. 359.—HAIR TURNING WHITE RAPIDLY.

Mézerei relates that, "Ludovicus Sforza, surnamed 'the Moor,' having been taken prisoner by Louis the Twelfth

was seized with such terror, that the night before he received his punishment, his hair, which had been very black, became all white, so that his guards the next day thought him to be another person." Montaigne tells us of a gentleman whom he met at the Baths at Plombières, in whom one-half of the beard and one eyebrow suddenly became white in consequence of a sudden emotion, the opposite side remaining perfectly black.

No. 360.—THE "FELL" TREATMENT OF CANCER.

It would be very desirable to obtain some information as to the result of cases treated by caustic after the Fell method, now that two years, and in some cases three years, have elapsed. The cases related in the Middlesex Hospital report, and in Dr. Fell's book, would now be of value, if we could know the present state of the patients. Allow me, therefore, to suggest, that any of your readers who may know the ultimate results of the caustic treatment in any case, or the present condition of such patients, would do good service by sending you a short account, stating especially the age of the patient, the nature of the disease, the immediate effects of the caustic, the period of its application, and the ultimate result, or present state. This may help us in determining the important question if caustic possess any real advantage over the knife in the removal of cancer, or the retardation of a return of the disease.

F.R.C.S.

London, July 18.

No. 361.—BONAPARTE IN AN EPILEPTIC FIT.

"I attended him," said Talleyrand, "to Strasbourg, and was alone with him in the house of the Prefet—in one of the chambers there—when he fell, and foamed at the mouth. '*Fermez la porte!*' he cried, and from that moment he lay as dead on the floor. Bertier came to the door; '*On ne peut pas entrer!*' The Empress came to the door; '*On ne peut pas entrer!*' In about half-an-hour he recovered; but what would have been my situation if he had died? Before day-break he was in his carriage; and in less than sixty hours the Austrian army had capitulated" (At Ulm).—*Rogers's Recollections.*

No. 362.—BORDEU ON POLYPHARMACY.

"These things," Bordieu writes one hundred years ago, "have satisfied me that remedies are too multiplied. The profusion of them renders the disease obscure, and forms an obstacle to its cure. The fury of treating diseases by the giving of drugs on drugs, having seized ordinary heads, Physicians are at this day more required to prevent the use of them than to prescribe them. The national practice, and the observations of the most sensible Physicians demonstrate, more or less clearly, the invincible inclination that men have to prefer certain ideas to others, which are as well-founded as those which they prefer. I declare without passion, and with all the modesty to which my feeble knowledge condemns me, that when I look backwards, I feel shame at having insisted so much on bleedings, emetics, and purgatives. I seem to hear Nature crying out, '*Disturb me not; let me alone; your drugs cure not, and especially when you heap them up in the body of your patient; it is I alone who cure.*' Those periods of the disease which seem to you the most tempestuous, are those wherein I should regain my health, if you take not my forces from me. Better let me alone, and leave all the work to me, than try your doubtful remedies."

No. 363.—HARVEY'S PORTRAIT.

There is no good engraved portrait of Harvey to be bought at the shops. Two or three book-prints exist, but they are very poor, and a Dutch engraving from the painting late in the collection of Dr. Mead is so scarce as to fetch a high price. The modern composition of the Demonstration of the Circulation to Charles is not a fair portrait. Would it be possible to get an engraving from the painting in the Manchester Exhibition by subscription, or can you suggest any other way?

SATURDAY, OCTOBER 8.

DEFECTIVE PERFORMANCE OF VACCINATION.

MR. GRIFFIN has addressed a letter to the Privy Council, the Poor-Law Board, and the Registrar-General, on the present defective performance of Vaccination throughout the country, which the pressure of other important matter has alone prevented us from noticing before. The subject was brought under the notice of Parliament last Session by the Earl of Shaftesbury, and Mr. Griffin has been induced to examine the public records for information; but from the inefficient state of the Registers he has found it impossible to arrive at any definite conclusions as to the extent to which Vaccination is practised in England and Wales. He recommends that a joint Committee of Inquiry should be appointed by the three authorities to whom his letter is addressed, with a view of obviating the anomaly of separate orders being issued by the Privy Council, the Poor-Law Board, and the Registrar-General on the same topic. It is represented that by the present system much time is unnecessarily occupied by the process of filling up double sets of certificates by the Vaccinators; and, indeed, the task is so laborious that many Medical men refuse to fill them up at all. This statement is proved by the table printed below, which shows that although 411,268 Vaccinations were paid for by the public, only 376,798 were returned to the Registrars, the returns in the other cases being neglected altogether. To remedy this defect it is suggested that a more simple form of certificate should be adopted, and that when the Vaccinator fills up and returns this document to the Registrar, he should receive a small fee for his trouble; by which means a return would at least be insured of all public vaccinations. Mr. Griffin, as the result of his own experience, denies that the defective performance of vaccination is due to repugnance to the practice on the part of the population, and attributes the neglect to mere carelessness and procrastination—obstacles which might be removed by stimulating the vigilance of Registrars and Medical men, by giving a reasonable reward for their services. It is also desirable that a quarterly list of children one year old, and unvaccinated, should be made out by the Registrars and sent to the vaccinators of their respective districts, who would then call upon the parents or guardians and urge upon them the necessity of immediate vaccination of the children; and in case of non-compliance, the penalties should be sued for—except, of course, where the children are proved to be sickly. Another point, which is very properly adverted to, is the smallness of many of the vaccinating districts, and the consequent impossibility of keeping up an adequate supply of lymph. It is therefore suggested, that when vacancies occur among the public vaccinators (such vacancies now averaging 270 per annum), the smaller districts should be united. It appears by the Table, that there are 915 vaccinators who receive less than 5l. per annum,

and many of these receive only a few shillings. It is obviously impossible for persons vaccinating so little, to

keep up a supply of lymph, however anxious they may be to do so. It is hoped that under a better and more equitable

arrangement of Poor-Law Medical affairs, the subject of the payment of the public Vaccinators will be carefully considered, and a definite system of remuneration adopted. At present, as is well known, the payments are entirely arbitrary, some Boards of Guardians paying 1s. per case for vaccination, while others give 2s. 6d., or even more. The annexed table shows this remarkable disparity of payment even in entire districts of the kingdom; thus in the South Midland Division the average remuneration is 2s. 6½d.; while in the Metropolis it is only 1s. 0½d.; and the Medical officers of Union Houses have no fees at all. Mr. Griffin proposes a graduated scale of payment to the Vaccinators, as for instance, 2s. 6d. per case for the first hundred cases per annum; 2s. up to the next 400; and above this 1s. 6d. per case, and he recommends that if the Vaccinators neglect to give a certificate of Vaccination which has been performed successfully, or give a certificate of successful vaccination without having ascertained the fact by personal inspection, they shall for each such offence be subject to a fine of 20s., one-half of the fine to be paid to the informer, and the rest to the Poor's-rate. These suggestions are really very valuable, and we hope that they will be acted upon, as the present neglect of Vaccination is a disgrace to a civilized age and country.

VACCINATION STATISTICS.

THE WEEK.

A Correspondent writes to us: "That the general indignation of the Profession and the Regulation of the Council, and the virtuous Resolution taken by the College itself, have had little effect on the traffic in licences at the Edinburgh College of Physicians. Upwards of sixty licences were disposed of there last Tuesday week." We must once again ask, Why is it that no list of the gentlemen who take these licences is published? Why should there be any concealment in the matter? If the gentlemen who take that licence, and the College who grant it, have no shame in the matter, why don't they act like all other public Licensing Bodies?

The flogging authorities at Woolwich admit that they were wrong in flogging the man with boils on his back. A military Court of Enquiry has investigated the case—no doubt in consequence of the public pressure of opinion—and it finds the facts so unpleasant, that it is forced to look out for a scapegrace to bear the odium and disgrace of them. The Doctor, on an occasion of this kind, presents a tempting mark, and he has been made—after usual custom—to bear the blame in this blameable business. The Journals say:—

"We understand that after hearing evidence and carefully

considering the case, the Court decided that the Medical officer was blameable for allowing the punishment to be inflicted, and that he was reprimanded accordingly."

Now this is all very pretty as an outlet for the inspirers of Military Flogging; but it does not satisfy us, and we are sure it will not satisfy the public. The gross injustice of the thing is plain on the face of it; and we have too strongly in remembrance examples of a similar kind, in which the sins and ignorance, and stupid folly of martial red-tapeism have been slid off on to the shoulders of our Professional brethren from the feeble backs of the guilty. The Crimean war produced a tolerably thick crop of such injustices. We are delighted to see that this question of back torture is not allowed to rest by the public. The day is gone by when people will submit to be silent on matters of this kind. The public know that they are much more capable of giving a true and independent opinion in a matter of this kind, than stiff, professional, military martinets.

The first trial in Scotland for infringement of the Medical Act took place on Friday, the 23rd of September. Mr. Broatch, a Medical Practitioner in Ruthwell, Dumfriesshire, was placed at the bar of the Circuit Court of Justiciary, presided over by the Lord Justice Clerk, and tried before the

Lords of Justiciary and a Jury, charged with infringing the provisions of the Medical Act by getting his name inserted in the Medical Register by false pretences. From the evidence given, it appeared that Mr. Broatch transmitted to the Medical Registrar for Scotland a declaration solemnly setting forth that he had produced his diploma from the College of Surgeons to a Justice of the Peace, and to a Dr. McCulloch, a Medical man of some notoriety in Dumfries. These persons declared that they had inspected the said diploma. Thereupon Mr. Broatch was registered. Suspicion having arisen, Mr. Broatch was applied to, to produce his diploma, when he stated that he had lost it many years ago, and Dr. McCulloch in the most unblushing manner admitted, in a letter to the Registrar, that he believed the diploma to have been lost, and therefore certified that it had been produced before him. After a lengthened trial, in which Dr. McCulloch appeared as a witness against him, Broatch was found guilty, and sentenced to three months' imprisonment. The following remarks from the summing up of the Judge are worthy of all attention:—

"The jury ought to remember that they were trying an offence under a statute; as to the moral guilt of the case they had nothing to do: the question was, Had an offence been committed within the meaning of a clause in an Act of Parliament?—and if so, a certain penalty attached to that offence. They should attend to the words of the statute quoted in the indictment. They were wilfully attempting to procure or procuring registration. They might throw aside the charge of attempting, as the attempt had been successful. The charge was the wilful procuring of registration by particular means; that is, panel must have known well what he was about, that what he did was done with his eyes open, not by making a mistake. The means used must have been false or fraudulent representation in words or writing. In this case the thing was done in writing. As to some facts of the case there was no dispute. Panel wrote and signed a declaration which he sent by post to Dr. Robertson, and by that, and that only he was registered; if the representation made was of the character described by the statute, he feared there could be no doubt that an offence had been committed. The question under the statute was narrowed to a single point; the words were false or fraudulent, not false and fraudulent. Then, the only important question was, Was the representation either false or fraudulent."

The Medical Schools have opened this month under very favourable auspices. The number of Students entered has been much larger than usual at nearly all the Schools at so early a period of the Session. An account of the Introductory Lectures will be found at the commencement of this number. The principal novelty of the year is the inauguration of a Metropolitan School of Dental Science. This School was opened on Wednesday by an introductory address from Dr. Richardson, and a dinner at the Freemasons' Tavern. We think the Profession generally will sympathise with this effort of the Dentists to raise themselves to a distinct and independent social and Professional position; while the attempt to raise up a body of Dental Licentiates of the College of Surgeons will meet with the reprobation it merits. Like the Licentiates in Midwifery, the Licentiates in Dentistry would become a class of nondescript offshoots of Surgery, and, without raising their position as Dentists, they would lower that of the Surgeons with whom they became allied. Were the College of Surgeons governed by the "College" instead of by the "Council," no such proposition would be entertained for a moment.

We have on a former occasion alluded, in terms of surprise and incredulity, to a system which is said to exist in the United States, of selling Medical degrees to applicants from other countries, without residence or examination, and it is

made to appear that certain parties on the other side of the Atlantic are actually touting for candidates in Great Britain. We have been favoured with a communication from a correspondent in Yorkshire, inclosing the following letter from America, which is of so extraordinary a nature that we are induced to print it entire; but we are authorised to state that Mr. Dale, the gentleman to whom it is addressed, has no acquaintance whatever with the writer, nor has he ever transmitted any sum of money to America for the purposes alleged. We hope that the Universities of the United States will repudiate all connexion with proceedings so questionable as those alluded to, and with respect to the value of American Diplomas, or of any other foreign Diplomas, we have only to remind our readers that such documents, however "splendid" they may be, or however "elegant specimens of Latin composition" they may exhibit, are utterly worthless in this country. We must repeat the suspicion expressed on a former occasion, that the whole affair is a hoax; but we may observe that the names and localities specified in the letter are the very same as those contained in the previous letter on the same subject to which we have already drawn attention:—

"Auburn-street, Hudson, N.Y., U.S. America,
"August 16th, 1859.

"DEAR SIR,—Yours of the 7th inst., enclosing a £5 Bank of England note, came safe to hand, for which receive my worthy thanks. I have devised all in my power to obtain your diploma, but find it no good to apply to the Professors, as they are so guarded and watched by the Trustees of the University. It is more difficult to obtain a diploma in this country than in England, for I do not think there is a College in all America that would grant a diploma for £10,000 in money; nevertheless, some of the higher Universities confer their greatest honours: 'Pro gradu Doctoris, summisque in medicina honoribus, ac privilegiis ritè et legitime consequendis;' or, in other words, a fine composition in Latin Thesis, which occasionally in this country run up to 800 pages; so you see nothing short of a refined education will do in the States; and I believe the Latin Secretary and Supervisor of Theses is the only channel through which an M.D. qualification can be obtained, and even in this case the applicant must be a regular qualified Surgeon. On minute and secret inquiry, therefore, I find your only plan is to write to the Latin Secretary yourself; forasmuch as he has more power over the Chancellor and Board of Trustees, to fetch up a mandamus from the Lower College than any other person. Indeed, to my certain knowledge several Surgeons in Ireland have obtained University degrees through his powerful influence; and one Surgeon in Scotland whom I know well, only sent him £70, Bank of England, for which he wrote a Latin inaugural thesis of 100 pages, printed 200 copies of the same, delivered them to the Venerable the Dean as the common keeper and distributor of the University editions, and then sent over a great diploma, with all the insignia and trappings of a University degree. As I said before, all our University degrees are elegant specimens of Latin composition, and much more splendid than the British ones.

"A letter sent to his mansion would be more exempt from the suspicions of the Faculty, than through the channel of his Chambers in the University. Such being the case, his address stands thus: Dr. Bellamy, T.P.S.S., Clarksville, Cayuga County, New York State, America.

"I would not advise you, as some have done, and as suggested in your last, to remit half £5 (cut) to solicit attention and answer, for it is too contemptible, and makes a bad impression on so grave an occasion as that of taking out an M.D. degree; besides, what is £5 to a man in his exalted stand, with a revenue (and honours attached thereto) of more than £10,000 a-year?

"You had better not answer this until you hear from me again, lest peradventure your good letter miscarry, as I am just on the eve of moving 200 miles south. Excuse my writing more this morning, as I have just completed ten letters with no other aid than that of my son.

"Your attached and faithful Friend,

"W. JOHN DOWER, Surgeon, etc.

"John Dale, Esq., London, Great Britain.

"P.S.—Observing your intended removal into Yorkshire, I venture to direct accordingly. Your good influence on my behalf has had the following effect, causing these to appeal to me for a 'Dip.'—Henry Noye, Esq., Cormac House, Falmouth; John Taylor, Evesham, Worcestershire; J. W. Paynter, Esq., Oscut Hall, Pembroke; Thomas Penman, Esq., Hendon-road, Bishopswearmouth.

"Now, I wish you to write to these parties, taking £30 from each in my name, when I will instantly commence proceedings; but first and foremost they must send £5 to the Latin Secretary for presenting their proposals before the Faculty.

"Enclosed are the seeds you ask for, but it is not the real 'furze plant.'"

Dr. Moorhead, Surgeon to the Weymouth Infirmary, complains to the *Times* that a false impression respecting his Infirmary and its Medical staff has been excited in the public mind, through a remark made on it by "Our Special Correspondent." For our own part, we must say, that Dr. Moorhead's letter itself reveals rather an anomalous state of the carrying on of an Hospital. Here are some three or four sufferers from the *Great Eastern* explosion—very properly taken out of the ship at the earliest possible period—brought to the Weymouth Infirmary. For eight long days, the Doctor tells us, did they receive the attention required by them from the Medical officers of the Hospital; but time runs on, and burns heal slowly, therefore:—

"The Medical officers of the Hospital, whose services are rendered gratuitously, then formally requested the Surgeons of the ship to take the poor men into their own charge, finding that attendance upon them exacted an amount of time wholly incompatible with the performance of their other professional duties."

This we believe is about the first time in the annals of "Gratuitous Medical Services" rendered to public charities that the Medical officers have actually struck work, under the allegation that they have their own affairs to attend to, that they get no pay from the Hospital, and that the work is too much for them. We have often pointed out the folly of gratuitous Medical services; but at the same time we are proud to say that our Profession nobly fulfils the promises which it has taken upon itself, so that there must be something unexplained in the background here; possibly some financial difficulty between the Governors of the Infirmary and the *Great Eastern* Directors. But some further explanation is certainly due to the Profession.

The news recently brought home as to the fate of Sir John Franklin, shows very remarkably the fault committed by Government in neglecting to follow the advice of a well-known member of our Profession—Dr. King. It is now known that Franklin's ships were wrecked close to an island—King William's Island—lying off the western land of North Somerset; and traces of the expedition have been found on the southern shore of this island, at Point Ogle on the Continent of America, and at Montreal Island in the estuary of the Great Fish River. Now, in February, 1845, Dr. King proposed to Lord Grey, then Colonial Secretary, to go by the Great Fish River to the western land of North Somerset to aid the Franklin Expedition in its survey. Two years afterwards, when anxiety was felt for the fate of the Expedition, Dr. King made his second offer to Lord Grey to go by the same route to the same coast to search for and assist the Expedition in its difficulty. The letter making this offer was dated June 10, 1847, and, curiously enough, it is now shown that Franklin died on the 11th of June, one day only after this letter was written, near the very spot which Dr. King proposed to explore. After Franklin's death, it appears from the records found by Captain McClintock, 105 survivors were on the road to the Great Fish River, in April, 1848;

so that had Dr. King's proposals of 1845 and 1847 been accepted he must have met the party and rescued them. Year after year Dr. King reiterated his warnings and offers, and in 1856 memorialised the Admiralty to arrange a combined effort by sea and land, again directed to the precise spot where the remains of the expedition have been found. Had his offers been accepted, not only would our gallant countrymen have been rescued, but no necessity would have arisen for the expeditions of Ross, Richardson, Collinson, Austin, Penny, Belcher, or Kellett, at a Government expense of two millions; nor for the private expeditions under Ross, Kennedy and McClintock, or the American efforts of De Haven and Kane. We do not mention this in any spirit of vain regret, but to point out that a summer land search up the Great Fish River would be devoid of danger, would be inexpensive, and might be successful in rescuing some of the 105 survivors, all of whom can scarcely have perished in a country where there is plenty of game.

REVIEWS.

Nature and her Agents shown to be more efficient in Curing Disease, and less hazardous to employ than extreme Drug Medication By SCRUTATOR VERAX. Pp. 80. London: 1859.

UNDER the guise of a benevolent wish to enforce dietetic and hygienic rules upon the public, the author of this pamphlet indulges in a tissue of vulgar abuse against the educated members of our Profession, while his sympathies are warmly expressed for the numerous systems of quackery which constitute some of the fashionable follies of the day. The amount of information possessed by this arrogant pretender to exalted Medical science, may be estimated from the fact that he tells us in one place of atmospheric air containing *about half per cent. of carbonic acid!* And in another place he complacently informs his readers that cancer, if not too far advanced, *is amenable to the influence of oxygen gas!* It is dangerous to play with edge-tools, and before a man criticizes and ridicules the practice of others in the treatment of disease, he should study at least the rudiments of chemistry and pathology.

The Sense Denied and Lost. By THOMAS BULL, M.D. Edited by the Rev. B. G. JOHNS, Chaplain of the Blind School, St. George's-fields. Pp. 214. London: 1859.

DR. BULL was well known as an obstetric Practitioner in this metropolis for many years; but while he was still in the prime of life his health gave way, and for the last eight years of his existence he was afflicted with total blindness. While in this melancholy condition he solaced himself with such pursuits as were compatible with his tastes and with his altered state; and among other occupations he interested himself in the education of the blind, and in writing the book now before us. It appears, indeed, that he actually wrote it himself, or at least a considerable part of it, being assisted by one of Wedgewood's writing-desks.

Under any circumstances, such a work would prove an interesting contribution to literature; but under the peculiar position in which the writer was unhappily placed, it possesses many special claims to notice. It shows how, under one of the greatest evils which can afflict human nature, the mind is able to reconcile itself to its privations, and how, by the increased exercise of the other senses, the deficiency of sight may, in some measure, be compensated. The author has carefully collected together the history of many distinguished persons, who, although deprived of sight, have made themselves conspicuous by their intellectual acquirements, some having been even illustrious mathematicians, astronomers, naturalists, chemists, poets, and musicians. Some amusing illustrations are also given of persons being conducted along unknown paths by blind guides, who, by the great acuteness of their other faculties, had acquired an accurate knowledge of localities. Among the mechanical arts, it is well known that several are exercised, with advantage to others and profit to themselves, by blind persons; but many will be astonished to learn, that even the business of a tailor may be executed by a

blind man, and that one case is on record of a blind man having actually excelled in watch-making.

The various topics connected with this subject are discussed in a very philosophical manner, and both on account of its own intrinsic merits, and of its bearing upon the amelioration in the condition of a large portion of our suffering fellow-creatures, this little volume well deserves, and will command, extensive perusal. The happy and contented spirit in which Dr. Bull spent the later years of his life is a sufficient evidence of the good which may be accomplished in relieving the tedium of a sightless existence, by the adoption of such measures as are calculated to open other avenues to the contemplation of external objects, after, "wisdom at one entrance" is "quite shut out."

Traité d'Electricité et de Magnétisme: avec leurs Applications aux Sciences Physiques, aux Arts, et à l'Industrie. Par MM. BECQUEREL et EDWARD BECQUEREL. Vols. I. II. III. Paris: 1855.

(*Treatise on Electricity and Magnetism, with their Applications to the Physical Sciences, the Arts, and Industry.* Paris: 1855.)

Resumé de l'Histoire de l'Electricité et du Magnétisme, et des Applications de ces Sciences à la Chimie, aux Sciences Naturelles, et aux Arts. Par MM. BECQUEREL et EDWARD BECQUEREL. Pp. 300. Paris: 1858.

(*Compendium of the History of Electricity and Magnetism, and of the Application of these Sciences to Chemistry, the Natural Sciences, and the Arts.* Paris: 1858.)

THE extensive work of MM. Becquerel, who have long been known among the most zealous cultivators of electrical science, has just been brought to a conclusion by the appearance of the volume containing the *Resumé*, during the last year; and this volume, although the last in point of time, is intended to precede the three volumes published on the same subject in 1855. The whole forms one of the most complete treatises on electricity in any language. The subject is treated in all its various shapes, from the early observation of the attractive powers of amber by the ancients, down to our present era of electro-plates and electric telegraphs. In so comprehensive a work, proceeding from such distinguished savans, it is scarcely necessary to observe, that not only are the phenomena of ordinary electricity fully explained, but the whole theory and practice of Voltaic electricity, as well as magnetism and electro-magnetism, are minutely described, and the care with which all existing authorities upon these subjects have been consulted, is evident from the copious bibliography which accompanies each of the chapters in the *Resumé*.

Upon the therapeutical applications of electricity, the details in these volumes are not very copious; but the authors refer to the operation of galvanic cauterisation in some surgical diseases, and to the beneficial effects produced by the electric current in certain adynamic conditions of muscles, especially in paralysis.

It may not, perhaps, be generally known that the present Emperor of the French is intimately acquainted with electrical science; and, like his uncle, takes a deep interest in its future development. Louis Napoleon, in 1843, described a Voltaic pile to the Académie des Sciences, constructed by himself, of a single metal and two acid solutions; and in 1852, when he occupied the chief position of the chief personage in the French nation, he offered a prize of 50,000 francs to the author of the greatest discovery which should render the Voltaic pile economically useful in the arts or in practical Medicine. Judging by the wonderful powers of the electric telegraph, the future may conceal some other equally brilliant results of the simple experiments first made upon glass and sealing-wax, and our successors may admire even more than ourselves the splendid achievements attained by the labours of Franklin and Dufay, of Davy, Faraday, Volta, and Galvani.

Report on the Health of the Water-guard and Water-side Officers of Her Majesty's Customs during 1858. By J. O. M'WILLIAM, M.D., F.R.S., C.B., R.N., Medical Inspector, Her Majesty's Customs.

In this brief but valuable Report, Dr. M'William gives some important information as to the health of the persons living on or near the river Thames during the year 1858. It will

be recollected that in the early part of the summer of that year, and also during the summer which has now nearly passed, the river has not only emitted an effluvium of the most disagreeable character, but its state has excited the most anxious apprehensions as to the influence of its exhalations upon the health of the Metropolis. Nevertheless, it is an extraordinary fact, that the public health has by no means suffered in a degree at all proportionate to the admitted evil; and indeed we learn from the evidence of statistics, that the sanitary condition of London has been, for the last two years, somewhat above the average. Not only have the inhabitants of London generally escaped from the ravages of any epidemic or contagious disease, but the persons who reside upon or near the river have enjoyed a greater degree of health than usual, as we are informed in the present Report by Dr. M'William, who possesses extraordinary opportunities for forming an opinion. His duties are to superintend the health of the Water-guard and Water-side Officers of the port of London; the former class numbering upwards of 800, almost living on the river or in the docks, in ships or in barges and open boats, while the latter, numbering upwards of 500, are employed during the day in the docks, or at the various wharves of the bonded warehouses on each bank of the river. As the result of his inquiries, he finds that during the four hot months of 1858, the total number placed on the sick-list from all causes, although slightly in excess of those sick at the same period in 1855 and 1856, was below the average of the three previous years, and considerably lower than in 1857, the year immediately preceding, when the river and the docks were far less offensive than during the summer of 1858. We believe that the sanitary statistics of the present year will lead to a somewhat similar result. The facts thus ascertained by Dr. M'William are not adduced by him to discourage attempts made to purify the river, but he has honestly recorded them, and they will tend to allay the alarm which was not unnaturally felt that the putrid state of the stream might lead to extensive disease. In other respects the Report is very ably put together, as might be anticipated from Dr. M'William's high reputation, and it well deserves attentive perusal.

Oratio ex Harveii Instituto, in Aedibus Collegii Regalis Medicorum, Londinensis; habitâ die xxix.^{mo} Junii, 1859.

Auctore CAROLO JACOBO B. ALDIS, M.D., M.A. Londini: 1859.

In this Oration, Dr. Aldis passes in review many of the events which have marked the progress of Medicine during the previous year, and he pays a graceful tribute of respect to the memory of those distinguished members of our Profession who during the same period have quitted this mortal scene. The importance of sanitary science, the mischief and folly of the homeopathic quackery, and many other kindred subjects, are briefly but effectively handled.

Five Essays. By JOHN KEARSLEY MITCHELL, M.D., late Professor of the Practice of Medicine in Jefferson Medical College of Philadelphia. Edited by S. WEIR MITCHELL, M.D. Pp. 371. Philadelphia: 1859.

OF these five Essays, the two longest are those on Malarious and Epidemic Fevers, and on Animal Magnetism. In the first of these, Dr. Mitchell contends for the cryptogamous origin of fevers, in opposition to the views of Liebig and other modern chemists; and he adduces some able arguments in favour of his own proposition. In the second Essay, the claims of Animal Magnetism are elaborately discussed; but while Dr. Mitchell appears to believe in many of the phenomena said to be produced by this agency, he questions the existence of phreno-mesmerism, clairvoyance, and many other extraordinary effects described by the more advanced class of Mesmerists. The other three papers are comparatively short. One is on the Penetrativeness of Fluids, and another on the Penetration of Gases; and both these papers are founded upon philosophical investigations conducted by the author, who calls in question some of the conclusions drawn by other observers in the same field of inquiry. The last Essay, which is alone connected with practical Medicine, is on a New Practice in Acute and Chronic Rheumatism. In this paper, Dr. Mitchell advances an opinion that many of the cases con-

sidered as rheumatism are really due to disease of the spinal cord, and that they should therefore be treated by remedial measures directed to the spine. The cases recorded in illustration are too few to support a new plan of practice in rheumatism, but, as far as they go, they present points of considerable interest.

PROGRESS OF MEDICAL SCIENCE.

Selections from Foreign Journals.

ON COLD AFFUSION IN NARCOTIC POISONING.

By Dr. REEVES JACKSON.

"UNDER the impression," says the author, "that the value of cold affusion as a convenient and most effectual remedy in cases of narcotic poisoning, is not so highly appreciated by the Profession as it should be, I am induced to relate the following cases:—Every Practitioner who has had experience in such cases must have been painfully sensible of the impotency and impracticability of many of the ordinary means. When the degree of narcotism is very great, emetics cannot be swallowed, the stomach-pump is frequently not at hand, and galvanism, although a remedy of undoubted power, usually cannot be resorted to from want of the necessary apparatus. In view of the difficulties which surround the treatment of these cases, it is fortunate that there is a remedy always at hand, and one that in nearly every case in which recovery is possible by any means, is promptly effectual."

Three cases are related in exemplification of these observations. The first was a child eight months old, to which a large dose of Godfrey's cordial had been given five hours before the author saw it. Intense stupor and rapid sinking were present, and the case seemed hopeless. The head being turned downwards, a steady stream of cold water was poured from a coffee-pot over the occiput. When two or three gallons had thus been poured, the child made a long, gasping inspiration, and opened its eyes. They were soon closed again, but after the affusion had been continued awhile longer, the breathing became more distinct, and the child uttered a feeble cry. Suspension of the affusion was attended with complete reproduction of the sopor, which, however,

on yielded on its resumption, and after a while the child having been got to cry lustily, vomiting was produced by means of an emetic and tickling the fauces. In two or three days the child had regained its usual health. 2. A lad, aged 19, suffering from facial neuralgia drank a large tablespoonful of laudanum. The author was called to him seven hours after, and found him under the full poisonous effects of opium; the surface cold and clammy; the breathing irregular, slow and stertorous; the respirations eight in the minute; the pulse full, slow and very irregular; the pupils very contracted and insensible to light, the countenance calm and pale. Various means of arousing and exciting him were tried in vain, when cold water was poured upon the head from a large pitcher, held at a height of about eighteen inches. The effect was almost magical in arousing his sensibility; and, after a while, violent vomiting ensued, all symptoms of drowsiness disappearing afterwards, under the use of a cup of strong coffee. 3. This was an example of poisoning by belladonna, occurring in a lady, to whom it had been administered in an enema for the relief of neuralgia of the rectum. She was found by the author completely insensible, with a swollen, flushed face, slow, unsterorous breathing, and a small, hard (130) pulse. Various means were employed to arouse her without any effect. A large enema of thin gruel was first administered, in order to clear out any of the poison that might remain in the bowel; and a steady stream of water was then poured upon the back of the head and neck. In about five minutes she made an attempt to articulate; and the use of the affusion was suspended, as the patient was cold. Placed in bed, and lightly covered, in ten or fifteen minutes her face became flushed, and she again fell into a deep sleep. The cold affusion was reapplied, and she soon regained consciousness. Although she continued drowsy for some hours, she recovered without the use of any other remedy, her vision remaining dim and confused for about three weeks.

Dr. Jackson observes that although the efficacy of cold affusion in opium-poisoning has been proved before, he is not aware of its employment in the case of belladonna. "Toxicologists agree in stating that where an overdose of belladonna has been taken, the stomach and intestines are peculiarly insensible to impressions; and, in fact, the whole nervous system is temporarily paralysed. This fact of course detracts very much from the amount of dependence to be placed on emetics and purgatives, even when they can be swallowed, and obviously enhances the value of a remedy so simple and convenient, and which promises to be so useful, as cold affusion to the head. Evacuants, even admitting that they produce their full therapeutic action, can do little more than rid the system of that portion of the poisonous substance which is still unabsorbed, and although highly useful for this purpose, and not to be neglected, yet, as remedies to relieve the narcotism already produced, and which forms the real source of danger, they are comparatively worthless. Hence the necessity of a remedy which has the power to stimulate the nervous system to a sufficient degree of action to maintain the vital functions, while labouring under the prostrating influence of a narcotic poison."—*American Journal of Medical Science*, July, p. 77.

EXCERPTA MINORA.

Removal of Foreign Bodies from the Ear.—Dr. Archibald recommends the following as a very effectual procedure:—Upon the back of a circular piece of isinglass or court-plaister, two lines in diameter, a piece of thread twelve or fifteen inches long is to be attached by a very narrow strip of the same material, placed at right angles over the thread. When this is dry, a piece of muslin or cotton cloth is to be torn, two inches long, and broad enough to be rolled around both arms of the thread into a cylinder of required size and firmness. The ends of the thread should next be drawn so as to bring the plaister upon the extremity of the cylinder, around which one end of the thread may be wrapped, to keep it from unfolding. The meatus should now be freed from moisture, by means of a little lint or cotton; and the surface of the plaister should be wetted and applied to the foreign body. Adhesion will take place in five or ten minutes, and then the body may be removed with the plaister.—*American Journal of Medical Science*, July, p. 281.

Treatment of Diabetes.—Dr. Calhoun states that he has pursued the following plan with great success, especially in old subjects:—"Forbidding the use of fluids, except in small quantities, and enjoining the use of solid food and the observance of quietude, I direct the following powder to be taken three times a day, viz.:—Pulv. Doveri, gr. v.; acet. plumb., gr. iij.; sulph. quin., gr. ij. If necessary, the bowels are to be kept gently open with castor-oil. I have never found it necessary to continue the above treatment more than four or five days."—*Ibid.*, July, p. 282.

Calomel Insufflation in Diphtheria.—M. Bontemps performs insufflation with a powder composed of five parts of animal charcoal and a half part of calomel—the false membranes rapidly disappearing under its use, providing that they have not invaded the larynx, when the remedy, like so many others, fails.—*Gaz. des Hôp.*, No. 91.

Diffused Aneurism produced in a Singular Manner.—A soldier was shutting a window, one of the upper panes of which was broken. A fragment of the glass falling down, fell upon the middle of the external surface of the right arm, traversing the shirt sleeve, and making a small transverse wound, about two centimetres long, at the external edge of the biceps. An abundant jet of blood immediately followed, which was attributed to a wound of the cephalic vein. After the cicatrization of the little wound, a diffused aneurism was found to be occupying the internal and interior region of the arm, presenting at first much the appearance of diffused phlegmon. By an operation, performed twenty days after the accident, it was ascertained that there was a longitudinal wound of the brachial artery seven or eight millimetres long; and that, as the biceps was intact, the glass, to reach the vessel, had slid behind the muscle in its posterior sheath, and had then escaped from the wound.—*Moniteur des Hôpitaux*, No. 30.

To ensure timely re-vaccination, Dr. Babu recommends that every person on his first communion and marriage should be fortified with a vaccine certificate.

GENERAL CORRESPONDENCE.

"NEW TREATMENT OF HYDROCELE."

LETTER FROM DR. YOUNG.

[To the Editor of the Medical Times and Gazette.]

SIR,—In common with the Profession at large, I feel under great obligations to Dr. James D. Gillespie for his able letter in your Journal of September 10, 1859, on the above subject; but, as it treats of this operation in such a wholesale condemnatory style, I feel myself called on to say a few words in its defence; and I would add that my task will not prove a difficult one.

Had Dr. James D. Gillespie seen this operation performed by Professor Simpson, the probability is his cases might have terminated more successfully. I presume Dr. Gillespie has seen no case of this kind but that of J. L., on whom Professor Simpson operated with me on October 26, 1858, and reported in your Journal of February 26, 1859. This case, so eminently successful, was seen by Dr. Gillespie on the second or third day after the operation.

It is not a little remarkable that there should have appeared on the same day with Dr. Gillespie's letter a clinical report on the subject of hydrocele. That report gives the experience of Mr. Pollock, of St. George's Hospital. It says of the treatment of hydrocele by the wire seton:—"We have previously referred to the subject of the treatment of hydrocele by the passage of wires through the sac, which plan of radical cure has proved successful in several cases under Mr. Pollock's care at St. George's Hospital. On the 12th of August he tapped a very large hydrocele of the right side in an elderly man, and withdrew thirty ounces of fluid. A needle and wire were then passed through the canula and sac. The canula being withdrawn, the wire was then tied, and thus formed a seton. A second case of hydrocele of the right side was likewise tapped, six ounces of fluid evacuated, and the same process adopted of introducing a wire seton. These two made the fourth and fifth cases thus treated with success. The first was an example of encysted hydrocele of the cord—five months ago—the patient being in the Hospital *one week*. No irritation was caused by the wire, but it produced an amount of consolidation of the part sufficient to obliterate the cyst. The second and third cases were those of ordinary hydrocele; in these, however, there was not the same power of bearing the wire, and it had to be removed in forty-eight hours. In one it nearly produced suppuration, but at the same time the sac was obliterated. Mr. Pollock considers the advantage of using the wire seton to be, that the patient suffers much less pain than when the sac is injected with the tincture of iodine."

There is a slight difference here in the method of operating from that adopted by Professor Simpson; and although the results seem equally successful, I consider the operation of Professor Simpson infinitely superior to that of Mr. Pollock. I still insist on styling this operation by the "dignified title" of New Treatment of Hydrocele, inasmuch as it was never tried previous to Professor Simpson's advocating it.

Dr. Gillespie might as well argue that an old wooden vessel is equally as good as a new iron steam-ship, or that the latter is not a new improvement over the old, as to say or deny that the use of a metallic seton is not a new and improved agent over silk, which we all know has been in use for ages.

I would be ready and willing to allow Dr. James Gillespie all the credit of a new method of treatment of hydrocele, or any disease, were he to discover and prove "*mullied claret*" to be a superior injection over the tincture of iodine. The very reason of the "shortcomings of the seton," and the consequent failure of the cure of hydrocele long ago, was the employment of thread or silk, which we know excites such profuse suppuration, when used as a seton in the cure of disease as a counter-irritant.

Hence the newness of the wire treatment; seeing the fact is established, that the wire seton does not produce such severe suppuration as the common seton; and to prove this, I have tried the iron-wire seton as a counter-irritant in some other diseases, and invariably failed to produce suppuration; so we need not be astonished that the thread seton was abandoned for the cure of hydrocele.

Dr. Gillespie says, that the second reason which induced the change of treatment from the seton, was the discovery that it was unnecessary to obliterate the cavity for the radical cure of hydrocele.

I maintain, that to cure this disease radically, you must produce nearly complete consolidation and obliteration of the cavity of the tunica vaginalis; and that is not always effected by the iodine, as I have seen hydrocele often return after injection.

Dr. Gillespie also tells us that the seton has, with justice, been displaced in public estimation. In this I agree with him, as his reference here is to the seton of Pott, and not that of Professor Simpson. I must take the liberty of correcting Dr. Gillespie, when he speaks of Professor Simpson returning to the seton; neither is the operation a matter of theory, but of fact—except in the experience of Dr. Gillespie. After injecting a hydrocele with tincture of iodine, we do not expect only to restore the tunica to a "healthy state;" if it merely did this, the fluid would re-collect. We hope to obliterate the cyst *in toto*, or nearly so; and with this object in view we use the seton, and thus, in Dr. Gillespie's words, produce occlusion of the sac by adhesive inflammation.

In one part of Dr. Gillespie's letter, he says, that "only the parts in contact with the seton may be roused to adhesive inflammation;" and in another part he speaks of the suppurative action having spread over so large a surface, that two incisions were required to give exit to the pus. Now surely there sounds some mistake here, for, in the first place, I have invariably found that the adhesive inflammation spreads over the whole sac, provided the seton is properly inserted. It is also the opinion of Mr. Edwards that the inflammation diffuses itself; and secondly, if it were confined to the close proximity of the seton, how was such extensive suppuration produced? Dr. Gillespie condemns this treatment on his own experience only. I have hitherto upheld it, not on my own merely,—but on the experience of many others, and, as quoted above, on that of Mr. Pollock, who so entirely differs from Dr. Gillespie, as he explicitly says that the main feature of this operation is its comparative freedom from pain.

I beg leave to correct Dr. Gillespie when he makes me say, "that the pain goes on increasing to two, three, or even four days;" on the contrary, if he will read my papers again, he will find that pain is seldom, if ever, complained of.

From Dr. Gillespie's first case, I find the operation was performed with a packing-needle, certainly not the best instrument for such a delicate operation; I would, therefore, recommend Dr. Gillespie to have a needle made for the purpose by Mr. Young, of Princes-street. This case might have succeeded after the first operation, had the wire seton been retained longer, and five wires doubled used in place of two (a). As regards the second operation, I consider it unjust to have both methods of treatment performed at once in the same patient. The whole matter is summed up in this, that the new treatment of hydrocele has in two instances failed with Dr. James Gillespie, while, on the other hand, it has succeeded to admiration with all those who have performed it—such as Professor Simpson, Mr. Edwards, Mr. Pollock, Mr. Stainthorpe, Dr. Quinlan, and myself. And if I have been over-estimating the operation, after so many successful cases, I am sure Dr. Gillespie has undervalued its merits. He says, "I suspect if Dr. James Young will gather together his cases of cure at the end of a few months, he will find several in the same predicament as the patient of whom he reports on July 30th, 1859." The reference here is to the last patient on whom I operated, and who, though cured, suffered at the end of two months from a very severe blow by machinery, which reproduced the hydrocele. Now, I maintain the cause was sufficient to reproduce it; but, even allowing this one was a failure, I am able to inform Dr. Gillespie that on all the patients on whom I have operated for hydrocele since September, 1858, in not one instance has the disease returned, even at the lapse of eleven months.

On looking over Braithwait's "Retrospect of Medicine" for 1858, I find, at page 188, a paper by T. Spencer Wells, Esq., of London, "On the Radical Cure of Reducible Inguinal Hernia, by passing a needle through the Hernial Sac so as to produce its obliteration." In that article, we have not only the experience of Mr. Wells, but likewise that of Wertzler, and others, who have performed the operation very frequently, and with perfect success. My reason for noticing it here, is to ask Dr. Gillespie how he can reconcile the practice of such an eminent Surgeon as Mr. Wells, where neither much

(a) See correction by Dr. Gillespie in our last Number, p. 348.

inflammation, nor any suppuration followed the use of the needle, nor in any case peritonitis; and yet Dr. Gillespie says that extensive suppuration follows the use of the wire seton in hydrocele. Surely Dr. Gillespie will admit that in textures so delicate as these here indicated, and so likely to be affected by excessive inflammatory and suppurative action, if his theory held true, it would be sustained in this instance, *which it is not.*

I am, &c.,

JAMES YOUNG, M.D., Surgeon.

36, Castle-street, Edinburgh, Sept. 19th, 1859.

THE LATE MONOPOLY OF THE APOTHECARIES' COMPANY.

[To the Editor of the Medical Times and Gazette.]

SIR,—In your Students' Number of to-day you say (p. 303)—“We cannot conceive it possible, therefore, that any Student will seek his Medical qualification from the Apothecaries' Company, unless he feel certain that, for some time at least, in the district where he intends to practise, he may be compelled to maintain the right in a Court of Law, of recovering for medicines supplied in Medical cases. It is still believed that in England this power is alone possessed by Licentiates of the Apothecaries' Company. Any registered person can recover charges for attendance; but, if anyone think it necessary also to be able to recover for medicines, he had better take the licence of the Hall.”

As I cannot suspect you of any leaning to the Apothecaries' Company, I am surprised that you should not rather have pointed out, that this doubt is a mere *ruse* in the interest of the Apothecaries' Company, to frighten those who don't know the terms of the Act into taking their licence. What says Clause 31 of the Act?

“Every person registered under this Act shall be entitled, according to his qualification or qualifications, to practise Medicine or Surgery, or Medicine and Surgery, as the case may be, in any part of Her Majesty's dominions, and to demand and recover in any Court of Law, with full costs of suit, reasonable charges for Professional aid, advice, and visits, and the cost of any medicines, or other medical or surgical appliances rendered or supplied by him to his patients.”

I read three things in this clause:—First. The preservation of the Double Qualification, that every registered person is entitled to practise only Medicine if he has only a Medical qualification; only Surgery, if he has only a Surgical qualification; both, if he has both qualifications. Secondly. That he is entitled so to do in any part of her Majesty's dominions; thus abolishing the Apothecaries' late monopoly of Medical licensing, and establishing the long-desired reciprocity throughout the three kingdoms. Thirdly. That every person so registered, and so entitled to practise either Medicine or Surgery, or both, is besides (it is *and* to demand and recover) entitled to recover for advice, attendance, medicines, or other medical or surgical appliances; this power being conferred by the clause, just as the extension of the right to practise to any part of her Majesty's dominions is conferred.

As it would be inconsistent to hold (the free reading of this part of the clause) that every registered person with even one qualification could recover for both kinds of cases, while he could practise in one kind only, we must hold the strict reading to be, that the medically qualified can recover for advice, visits, medicines, or other appliances, in medical cases only; the surgically qualified the same in surgical cases only; and the doubly qualified in both kinds.

Very well; where now is the Apothecaries' pretence? I look in vain for any distinction between medicines and the other things to be recovered for. Those who register the licence of the College of Physicians, or a University degree, are authorised by this clause to practise Medicine in any part of her Majesty's dominions (of which England, the Apothecaries' late preserve, is one), *and* to recover for aid, advice, visits, medicines, or other medical appliances rendered or supplied to their patients.

Why this delay in the arrangement of a joint examination by the Colleges of Physicians and Surgeons? But a joint examination is in no way essential, if the Colleges cannot agree, although it would be a great convenience to the

student, and would save repetition of the examination on subjects common to both. Let the College of Physicians come out at once with a curriculum and examination for its Licentiate (for the Medical half of the General Practitioner), examining, like the Apothecaries, on everything except Surgery, and the students will go up for it, just as they go up for the separate diploma of the College of Surgeons. This is the step which is wanted, not necessarily a joint examination with the sister College; which, however, both Colleges would soon see it to be their interest to arrange.

September 24.

I am, &c.

F.R.C.S.

MYOPIA.

[To the Editor of the Medical Times and Gazette.]

SIR,—I wish to ask a few questions concerning Dr. Wright's new theory of long and short sight; as I suffer from myopia myself, I trust you will deem that a sufficient excuse for my trespassing upon your valuable space.

Dr. Wright says, the essential cause of myopia is in the iris which is preternaturally contracted, or else is too irritable. He also says that a bright light aggravates the congenital form by producing contraction of the circular fibres of the iris. As regards myself, I find that I can see much better on a bright sunny day than at evening or on a cloudy day, when of course the pupil is enlarged by the contraction of these circular fibres.

I wish to ask you the following questions:—

1. Why do I see worse at evening or on a cloudy day, when as Dr. Wright says, any means that cause dilatation of the pupil will enable the myopic individual to read with the book held at the same distance as a person would require whose eyes are sound?

2. If I could obtain the power over the muscular fibres of the iris, viz., to dilate and contract the pupil at will, should I be able to see any better?

3. Does Dr. Wright lay down any rules in the *North American Review* for the treatment of myopia?

4. Do you think I should injure my eyes by endeavouring to cause the dilatation of the pupil by rapidly changing the focus of the eye?

MYOPIA.

P.S.—I have only been short-sighted for the last three or four years, since I have been reading for the Medical Profession; but one eye has been short-sighted from birth.

TUNGSTEN STEEL.—Tungsten has nearly the same specific gravity as gold; and for hardness nearly approaches the hardest of natural bodies. It is found usually in company with tin-stone, and has been hitherto regarded as a mineralogical curiosity. One of the richest sources of the ore of Tungsten is in the tin-mines of Zinnwald, Bohemia, where it has been thrown into heaps as worthless for nearly 500 years. Franz Mayr, the proprietor of cast-steel works at Kapfenberg, in Styria, has combined this hitherto unprofitable metal with iron, and made from it steel of remarkable goodness, cheaper than English steel, and, it is said, in some respects superior. Excellent cutlery and tools have been made from it.—*Dingler's Polytechnisches Journal*.

COD-LIVER OIL IN A PALATEABLE FORM.—M. Bassi recommends a preparation of cod-liver oil, which “may be taken not only without difficulty, but with pleasure. Take 250 grammes of white bread; this is broken into pieces, and moderately roasted; it is put into a tinned vessel with two kilogrammes of water, which by decoction is reduced to one-half. This is then passed through a sieve, and lightly squeezed. The liquid is then exposed to a gentle heat until it has taken a gelatinous consistence. Then add to it 100 grammes of white sugar, and 60 grammes of isinglass. It is then removed from the fire, and left to cool. Next is to be added 2·50 grammes of tartaric acid, and the whole well mixed. Of the jelly of bread thus prepared is taken: jelly of bread 120 grammes, cod-liver oil 30 grammes, distilled canella water 15 grammes, essence of lemon twelve drops. Mix these well in a glass mortar. Under this form the cod-liver oil may be administered readily in large doses.”—*Bullet de Thérap.*

REPORTS OF SOCIETIES.

ROYAL INSTITUTION.

The Lord WENSLEYDALE, Vice-President, in the Chair.

Dr. R. DRUITT delivered a Lecture on

HOUSES IN RELATION TO HEALTH. (a)

Having alluded to the sickness, bereavement, and ruinous expense which sometimes ensue from the wrong choice of houses by private individuals, and to the disorders liable to be diffused amongst all classes, from the unhealthy dwellings of the poor, he proceeded to consider the subject of houses and their influence on health, under three heads. Under the first, he treated of deficiencies of air, light, warmth, and dryness, and of the maladies of degeneration to which they give rise, of which consumption and scrofula are types; under the second, he spoke of the common typhoid fever of this country, and of choleraic disorders, and of their origin in defective house drainage; and under the third, he discussed the conditions which give intensity and power of propagation to certain diseases, such as scarlatina and diphtherite. Amongst the details noticed under the first head, he observed that the ground on which a house is built should have the qualities of porosity and firmness; porosity is required in order that all water charged with organic debris, which happens to penetrate it, may pass onwards and undergo that rapid oxydation which is so happily effected by the London gravel. Wherever the soil is deficient in this quality, or where beds of gravel or sand come in contact with beds of clay, a thorough subsoil drainage is as essential for the health of man, as it is for the growth of sweet herbage. Spots can be pointed out in which the subsoil is swampy, and where fever has prevailed in consequence. Moreover, the land on which houses are being built around London, is sometimes raised artificially by what is called made-earth: that is to say, on a low, wet spot, quite undrained, are heaped all sorts of rubbish, road scrapings, mud, and refuse, mixed with organic debris; and over this the houses are built. Besides, the excavation of sweet wholesome gravel, and the filling in the vacuity with rubbish, has long been prevalent at the west of London, and was much to be condemned; and an instance was quoted of a house, whose rental was £400 per annum, built over a laystall of the last century, that is a pit where every kind of impurity was deposited, and now filled with black mould mixed with sheep bones. This earth, when dried and analysed, yielded ten per cent. of organic matter, and was as unwholesome to build on as an old churchyard. Want of firmness might be remedied by a solid floor of concrete, after the Roman manner, which would enable houses to be built with less chance of settlements and cracks, which are causes of unhealthiness, not merely by allowing cold and damp to enter, but by permitting currents of fetid air to come from unknown and distant sources. Thin walls, too, render a house not only extremely cold, but unwarmable in winter. Passing over the grouping and position of houses, and the width of streets, which ought to be regulated by the height of the sun in winter, we come to the internal arrangements, and air supply. The last may be provided by some special ventilating apparatus; or may be left to take care of itself; but even if left to itself, it will be prudent to see that the basement doors, and other chief apertures, are not near any source of contamination; moreover, great caution should be exercised in roofing in yards and areas with glass, as is often done, because the glass may cover over some sources of effluvia, and bring them into the house. This has been the cause of fever. The supply of air to the apartments should be large; diffused and not in perceptible draughts; and warmed; and should be so contrived as not to attract attention: otherwise persons who are afraid of pure air, especially servants and the poor, will speedily close up the apertures. The plan suggested by the Commissioners on Warming and Ventilation was exhibited, and described as fulfilling most of these conditions—inasmuch, as the air is warmed by the heat otherwise wasted by the chimney, and is introduced in ascending currents; and care

is taken that there is a channel of escape separate from the chimney, and that the upper part of the apartments should be the coolest. Any plan for bringing currents of cold air to the level of the feet, or of the bed, is to be condemned. Nothing can be a better evidence of the carelessness of our present system of air-supply to houses, than the fact, that much of it comes down the chimneys when there is no fire, bringing with it abundance of soot, and many, possibly unwholesome, products of imperfect combustion of organic matter. A free supply of pure air is the *sine qua non* to persons who lead in-door lives; inasmuch as the direct influence of close bedroom air in producing scrofula and consumption has been proved incontestably by Carmichael of Dublin; and later, by Dr. Guy. But till people have a sufficiency of food and clothing, it is a mockery to speak of pure air. Man's instinct chooses foulness before hunger; when the contact of pure air with the lungs, and of pure water with the skin, creates an appetite for food which he has no means of satisfying. Further researches on the composition of house air are to be desired. It is evident that the amount of carbonic acid represents that of the most volatile, and probably that of the most innoxious product of the presence of living beings, and consequently the minimum of atmospheric impurity. The speaker had made several determinations which showed how rapidly the quantity fluctuated according to the amount of ventilation and the state of the wind. For example, in a small room in May's-buildings, Brick-street, inhabited by two adults and three children—

Volumes of Carbonic Acid in 10,000 vols. of air.		
April 20th. Noon; family dining	..	13.74
„ 21st. „ „ „	..	9.19
„ 24th. Room empty, door open	..	3.34
„ 20th. All night	..	15.97
„ 21st. „	..	15.10
„ 22nd. „	..	12.27
In the Infant School-room, Curzon Schools, Mayfair, room crowded, with a window open at each end	..	9.46
In a bedroom, unoccupied, but with the doors and windows closed all day, the quantity fluctuated between 5 and 7 volumes per 10,000.		

The list of maladies arising from cold, damp, airless and sunless dwellings is a long one, and is identical with the maladies caused by hunger, depraved nutrition, solitude, and grief; moreover, the effects of dark, monotonous, and decayed dwellings upon the mind must not be overlooked, inasmuch as they produce a direct temptation to indulge in spirituous liquors. Under the second head, the speaker alluded to the great number of modes in which a house may receive poisonous vapours from sewers. If the house drainage has not been revised during the last ten years, there may probably be every variety of imperfect and dilapidated drainage; wells that once supplied a family with water, may have been converted into dead wells and receptacles of filth; and even when a house possesses a perfect drainage system of its own, it may be invaded by its neighbours: or the remains of old drainage systems may have been left by the carelessness or ignorance of workmen. Every pipe, too, of whatever sort, may be a means of bringing foul air from sewers; every such apparatus should, therefore, be examined from time to time, and be regulated with philosophical precision. The possibilities were described of the entrance of air from the public sewers into houses; either from stagnation and decomposition, or through the wind which at certain times penetrates the great sewers from the river; then wherever a sewer ends abruptly, the gases are sure to be driven out of it, through the apertures in the streets made for ventilating purposes. The effects of bad house drainage, and of sewer poison, are found in the prevalence of typhoid fever and choleraic maladies. The great fevers at Clapham, Croydon, Westminster, and Windsor, were all of this sort, and traceable to this cause; and instances were given of illness, year after year, visiting a family, and robbing it of one or more lives; and when too late, the discovery made that an ancient, unknown, and decayed sewer ran under the premises. Many such sewers exist underground, not noticed in any map, and unknown to the present generation of officials; serving only as reservoirs of foul gases, which find vent through most unexpected channels. It is in vain for the Physician to discuss remedies, while the

(a) From the Proceedings of the Royal Institution.

patient is still breathing the vapours which caused the disease. Lastly, the property which diseases have of lurking in certain quarters, and then breaking out with virulence, and acquiring a self-propagating force, was ascribed to impurity in general, and to defective drainage in particular. Scarlet fever, especially, was asserted by the speaker to be caused *ab initio*, as well as to receive power of extension from this source; but the limits of the hour did not permit him to develop the evidence on this point. Thirteen contagious maladies, at the least, can be produced at will; and the speaker believed that, in time, epidemic diseases would be found subject to human control; and that the surest mode of protecting the dwellings of the rich was to cleanse and ventilate the dwellings of the poor.

Diagrams were exhibited, showing the mortality in several parts of the parish of St. George, Hanover-square, by which it appeared that, out of 20,000 inhabitants of first and second class streets there died at home, in the three years 1856, 1857, and 1858, 10·78 per thousand per annum; while, in third and fourth class streets, there died at home, in those three years, 20· per thousand per annum, exclusive of deaths in Hospitals and workhouses. Taking the mews separately, there died at home 15·36 per thousand per annum. The mortality and population of several streets during these years was also exhibited in a diagram, which contrasted the low mortality of purely aristocratic, and first-class business streets, with that of the nest of low streets between Grosvenor-square and Oxford-street, where, owing to the crowded and unventilated state of the houses, there is a mortality of thirty per thousand; a mortality enhanced, of course, by the deaths of the children who are born but cannot be reared in such habitations.

MEDICAL NEWS.

ROYAL COLLEGE OF PHYSICIANS—At the Comitia Majora held on Friday, September 30th, A. T. Houghton Waters, of Liverpool, was admitted a Member of the College after Examination.

The following Extra-Licentiates of the College were admitted Members, under the Temporary Bye-Laws, at the Comitia Majora held on Friday, September 30th:—

CROWDY, CHARLES WITTON, Brighton
DICKINSON, JOSEPH, M.D., Liverpool
GRANTHAM, THOMAS PAYNE JAMES, Burgh, Boston
LANKESTER, EDWIN, Savile-row
LISTER, JOHN, Porchester-terrace, Hyde-park
PLOMLEY, FRANCIS, Maidstone
STEWART, JOHN GRANT, Greenwich Hospital
WRIGHT, THOMAS GIORDANI, Wakefield

The following Graduates of Medicine were also admitted Members of the College, under the Temporary Bye-Laws:—

BROWNING, GEORGE, M.D., St. Stephen's-crescent, Westbourne-pk.
BURNS, JOHN JAMES DOUGLAS, M.D., R.N., Chatham
CORMACK, JOHN ROSE, M.D., Amphil-square
GOOCH, WILLIAM HENRY, M.D., Ventnor, Isle of Wight
HOLDSWORTH, SAMUEL, M.D., Wakefield
HUMBLE, GEORGE ARTHUR, M.D., Upper-street, Islington
MACLACHLAN, DANIEL, M.D., Royal Hospital, Chelsea
MEADOWS, ALFRED, M.D., Cavendish-place, Cavendish-square
OLLIFFE, SIR JOSEPH F., M.D., Rue St. Florentin, Paris
POWER, ROBERT FRANCIS, M.D., Lower Grosvenor-place
ROBINSON, FREDERICK, M.D., Scots Fusileer Guards
SHEPPARD, EDGAR, M.D., Hanover-terrace, Regent's-park

APOTHECARIES' HALL.—Names of gentlemen who passed their Examination in the Science and Practice of Medicine, and received Certificates to Practise, on Thursday, the 29th September:—

ARMINSON, JOHN, Preston, Lancashire
GAYE, ARTHUR CHARLES, Minehead, Somerset
GREENWOOD, NEWTON, Truro, Cornwall
HORSLEY, HENRY, Croydon, Surrey
JACKSON, JOHN, Leicester
PARKER, ROBERT, Churton, Cheshire
RISTE, WILLIAM, Bere Regis, Dorset
SHEPHERD, JOSEPH BROOKS, Skidhill, Kent

The following gentlemen also on the same day passed their First Examination:—

BOWLING, THOMAS, Birmingham
HUME, HENRY, Newcastle-on-Tyne
LEE, LEONARD JOHN, Devonshire-square
WISE, WILLIAM CLUNIE, Plumstead, Kent
WITHER, FRANCIS ORDE BIGG, Basingstoke, Hants
KITCHING, THOMAS, Campbell-road, Bow

APPOINTMENTS.

ASHDOWN.—Mr. George Ashdown was unanimously elected Surgeon to the General Infirmary, Northampton, on October 1; vice, Mr. Terry, resigned.

HARRISON.—Mr. Reginald Harrison has been appointed House-Surgeon to the Northern Hospital.

DEATHS.

ALLEN.—July 24, Charles P. Allen, M.D., Surgeon, R.N.

BOCKETT.—Recently, William C. Bockett, Assistant-Surgeon, R.N., serving in H.M.S. *Havannah* on the Pacific Station.

DEAN.—September 29, at his residence, 32, Lucas-street, Commercial-road East, J. H. Dean, aged 62.

DEWAR.—On October 3, at Lower-road, Islington, Alexander Dewar, Surgeon R.N., late of Sunning-hill, Berks, aged 80.

FRENCH.—October 2, John James French, of 2, St. Peter's-street, Islington.

GOODRICH.—Recently, at Topsham, Edward Stratton Goodrich, aged 32.

HOUGHAM.—September 19, at Brookland, G. Hougham.

JEFFREY.—September 27, at Liverpool, Alexander Colquhoun Jeffrey, L.F.P.S. Glasgow, 1814, aged 69.

LITTLE.—September 18, at Headfort, County Galway, Francis Evelyn Little, L.R.C.S. Ireland, aged 38.

MCDONALD.—Perished, exact date unknown, in the last Arctic Expedition, under the command of Sir John Franklin, A. McDonald, of Lawrence Kirk, North Britain, Assistant-Surgeon, R.N.

MILTON.—Recently, William Meyler Milton, Assistant-Surgeon, formerly of the Royal Artillery, late of the 82nd Regiment.

MOREWOOD.—September 24, at Bath, G. Morewood, M.D., late Physician to the Forces.

PATERSON.—August 26, at Embro, Canada, James Malcolm Paterson, M.D., aged 26.

REID.—Perished, May 9, in H.M. sloop *Heron*, which foundered on the Western Coast of Africa, Samuel Reid, Acting Assistant-Surgeon, R.N.

RIGBY.—September 25, at Macclesfield, James Rigby, for fourteen years Surgeon on board H.M.S. *Princess*.

ROBERTS.—September 29, at his residence, Bradford, John Walker Roberts, M.R.C.S. and L.S.A. 1827, late Senior Surgeon to the Bradford Infirmary.

ROBERTSON.—Recently, Archibald Robertson, Surgeon, R.N. 1809 (retired).

SPROULE.—Perished, May 9, in the wreck of H.M. sloop *Heron*, Dr. Robert Sproule, Surgeon, R.N. 1856.

THORBURY.—July 13, at the European Depot Hospital, Benares, Bengal, George Thorbury, M.S.C. of the Medical Staff Corps, late of Staindrop, Durham, aged 33.

THORNE.—September 22, at South Molton, James Wilkins Thorne, formerly of Okehampton, Devon, M.R.C.S. and L.S.A. 1817; M.D. St. Andrew's, 1844, aged 63.

WILSON.—September 27, at Workington, Dr. John Wilson, formerly Physician to the Middlesex Hospital, aged 71.

WINDUS.—On August 10, at Chicacole, Madras Presidency, Frederic James Windus, Civil Surgeon, second son of the late John Windus, Esq., of Epping, Essex, aged 32.

SIR GEORGE GREY has laid the foundation-stone at Cape-town of a new General Hospital, which is to cost from £20,000 to £30,000.

MR. W. ELLIS commences, on October 11, a course of Lectures on Social Science, at the South Kensington Museum, under the authority of the Committee of Council of Education.

THE veteran Lord Brougham will attend the annual *soirée* of the Bradford Mechanics' Institute on October 12, and give away the prizes awarded.

THE MONITEUR DES HÔPITAUX. — This Journal, repressed by the arbitrary French Press Laws, has just reappeared, as a new journal, bearing for its title *Moniteur des Sciences Médicales*.

In the course of a few days, half-a-dozen cases of suicide were admitted into the New York Hospital. The number of cases of criminal poisonings and suicidal poisonings, has lately increased greatly at New York.

DR. FLEURY, whose journal, *Le Progrès*, was lately suspended by the Government, has commenced a new journalist life in a publication called *Journal des Sciences Médicales, et de l'Hydrothérapie Rationnelle*.

At the Lunatic Asylum at Zurich, those patients who refused food have lately been chloroformed; and, we are told, with perfect success, as it was not necessary to repeat the operation more than two or three times, in order to gain the object in view.

DISINFECTING OPERATIONS on the Thames-water were discontinued on September 3. The total quantity of disinfectant agents used during the past season has been about 4281 tons of chalk lime, 478 tons of chloride of lime, and 56 tons of carbonic acid, at a cost of £17,733.

The *Richmond Despatch* gives the following statistics of insanity among negroes in the United States. Louisiana has 1 in 2477; South Carolina 1 in 2999; Massachusetts 1 in 43; and Maine 1 in 14,—“clear and positive proof that the intelligence of the African does not accommodate itself well to liberty!”

PROFESSOR LEBERT.—This distinguished author of so many estimable works on physiology and pathological anatomy, has received a “call” from Zurich, where he has been Professor of Clinical Medicine since 1852, to fill the same chair in the University of Breslau, vacated by Professor Frerichs, who succeeds Schönlein at Berlin.

DR. ADOLPHE SIREY relates a case which is probably unique. It is one in which a biliary calculus is discharged from a suppurative in the right inguinal region. Dr. Sirey suggests the reasonable explanation, that the calculus had passed into the appendix vermiformis, and had there excited inflammation and suppuration in the parts around, and so found its way outwards through the abdominal walls.

M. MARC D'ESPINE.—M. Marc d'Espine, of Geneva, the author of the “*Essai analytique et critique de Statistique Mortuaire comparée*,” and many other contributions to Medical statistics, has just been nominated a Chevalier of the Legion of Honour. “It were to be wished,” says the *Moniteur des Sciences Médicales*, “that distinctions were always as well deserved. It is true that then, perhaps, they would become too rare.”

THE ROYAL TRIPLET BOUNTY.—On an application from Dr. Malcolmson, Her Majesty has directed £3 to be forwarded to Mrs. Smith, of Cavan, “in consequence,” to use the high-bred language of Sir C. Phipps, “of her confinement of three children at one birth.” Of course no reader will imagine that the Queen has been rewarding a cruel mother for shutting up three innocent babies in a dark hole.

THE CASE OF DR. SMETHURST.—The Home Secretary has come to no decision upon the point whether there shall be a commutation of the sentence of Dr. Smethurst. The delay which has been occasioned arises from the fact that circumstances have transpired which lead to a suspicion that there are other cases of a serious character against Dr. Smethurst, which the police have received instructions to investigate.—*Globe*. This has since been contradicted.

DR. WEISSE, Director of the Children's Hospital at St. Petersburg, asserts, after an experience of twenty years, that, in the colliquative diarrhoea of children at the breast, raw meat reduced to a pulp is a specific remedy. As the use of this remedy for the purpose indicated, has become very general at St. Petersburg, it would be interesting to know whether intestinal entozoa have increased of late years among these younger objects of Medical art.

At a late meeting of the Poor-Law Guardians of Marylebone, Dr. Bachoffner called attention to the surprising fact that in the past five years there had been 1109 illegitimate births in the district, of which 821 had been received in this workhouse; and out of the 1109, it was astounding to say that 516 illegitimate deaths had been registered. In another district there had been 223 illegitimate births and 209 illegitimate deaths. He considered that something must be done without delay. The discussion was then adjourned.

SOCIETIES have short memories. Dr. Bonnafont, “from a sentiment of justice and piety towards the memory of a young Physician too soon snatched away from science,” calls the attention of the Academy of Medicine to the fact, that Dr. Bayard, in 1846, received a silver medal from the Society of Encouragement for having applied a mixture of coal-tar and gypsum as a disinfectant of faecal matters. This same Society has decreed a medal (gold, by the way) to MM. Corne and Demeaux, for applying the same mixture to putrefying wounds, without making any reference to M. Bayard.

ARTIFICIAL PROPAGATION OF THE SALMON.—Mr. A. D. Bartlett has given in the proceedings of the Zoological Society a note of the experiments conducted for this purpose at the Crystal Palace, the object being the introduction of salmon into the rivers of Australia. Mr. Ramsbottom obtained at least 20,000 ova from Wales. In thirty days many were hatched, and appeared to be doing well; but, unfortunately, through the thoughtlessness of some workmen, the young salmon were left for several hours without fresh water, and, consequently, all perished. The experiment will be renewed next year.

THE LAST OF THE FRENCH DOCTRINAIRES.—“Among the Physicians, called of the French School, who now, alas! have their faith in *anatomisme* shaken; who, uncertain and hesitating between a vitalism whose metaphysics affright them, an organism, whose powerlessness drives them to despair, and an empiricism whose therapeutics disgust them—among these stands M. Piorry, the sole professor of a doctrine, imperturbably marching on in the way he has traced out for himself, and casting a look of superb disdain on those who have left it. Amidst this universal feebleness of minds and faiths, the energetic belief of M. Piorry well deserves remark.”—*L'Union Médicale*.

DR. MURCHISON endeavours to show, by the collection of a number of historical facts, that two febrile diseases, such as are thought to depend upon the introduction of a morbid poison into the blood, may exist in the system at the same time. And he, therefore, concludes that upon the mere occasional co-existence of the peculiar eruptions of typhus and pythogenic fever (as he designates typhoid fever), no argument can be based as to the identity of the poisons of these two diseases. We think it is noticeable, that almost all the cases, he gives as illustrations of the fact of this compatibility of essential fevers (with a few exceptions of his own) are not of modern date.

THE LONDON MEDICAL REGISTRATION ASSOCIATION.—A meeting of the Committee was held at the offices of the Association, No. 5, Charing-cross, on Wednesday evening last, Dr. Kirby in the chair. A large amount of correspondence was read. Among the resolutions agreed to was one that the question of the right of dentists to assume the title of “Surgeon”—Dentists should be immediately brought to an issue, and the steps to be taken were determined on. Votes having been taken, it was unanimously carried that several other prosecutions should be commenced; and, as will be seen by an advertisement in our columns, the annual general meeting of the Association was fixed to take place at the Freemasons' Tavern, on Thursday, the 3rd of November ensuing.

WE find, in a Report read by M. Marinus to the Royal Academy of Medicine of Belgium, the following conclusions arrived at concerning vaccination and small-pox:—1. The preservative action of vaccine is absolute in nearly every case. 2. In a certain very small number of cases, the preservative action is not permanent, but it never departs before seven or ten years after the vaccination has been effected. 3. The cases of small-pox which occur after vaccination are very few, and generally of little importance. 4. In all cases, therefore, re-vaccination should be practised, as the Practitioner cannot

decide in any case whether the preservative action is still in force; and the re-vaccination should be performed at the ages of 10 to 15. 5. Vaccination exercises no baneful influence on the constitution.

MEDICINE AND SURGERY.—A lengthened and warm discussion took place at the Medico-Chirurgical Society not long ago, on the subject of the treatment of scrofulous joints, and chiefly in reference to excision of joints. We were at the time much struck with the fact that on the occasion in question not one single word was said (if we remember rightly) respecting the Medical treatment of these affections. It may, therefore, be fairly said that Abernethy's remark is not without its application, even at the present moment; and for the benefit of those who have decreed that no Medical knowledge is necessary for the practice of Surgery we will quote that master's words:—"An evil seems to me to have arisen from the artificial division of the healing art into the Medical and Surgical departments. This division has caused the attention of the Physician and Surgeon to be too exclusively directed to those diseases which custom has arbitrarily allotted to their care."

WOORARA IN TETANUS.—We have already noticed the fact that M. Vella, of Turin, had experimented with the above material in cases of tetanus which occurred lately in the military hospital at Turin. M. Bernard had often shown in his lecture at the College de France, that this substance, when introduced into the system, exhibits an action directly opposed to that of strychnia; it seems to paralyse the action of the motor nervous system. In animals the poisonous effects of one of these substances have thus been frequently counteracted by the properties of the other. It was from facts of this kind that M. Vella took his practice. In two of his cases the remedy was tried late in the day, but although the patients died, their symptoms were markedly ameliorated. In the third case, he commenced operations earlier; and before twenty-four hours had expired, the woorara was applied in fomentations to the wound—10 to 50 centigrammes of it to 40 grammes of liquid. "In about three-quarters of an hour after each application, and for half-an-hour at a time, there was a marked diminution of the tetanic rigidity, followed by such a complete relaxation of the muscles, that the patient was able to drink, make water, and sit up in bed." "On the other hand, when the action of the woorara had ceased, the wounded limb was again first seized with spasms. For the first three days of this extraordinary treatment, absorption by the wound was sufficient to produce muscular relaxation, and general repose of the body. After this period the Surgeon applied a blister to the thigh, and on the eighth day, repeated it, in order to produce a large absorbing surface. During four days the dressings were renewed every three hours; and afterwards every five hours. On the twelfth day, the attacks, which had gradually diminished in duration and intensity, completely disappeared. Fifteen days afterwards, the man left the Hospital." This case M. Bernard considers as a beautiful specimen of the application of scientific logic to therapeutics; but M. Velpeau does not agree with him, and thinks people often jump too rapidly to conclusions. "The author of the communication," says M. Velpeau, "has stated that there were numerous cases of tetanus among the wounded in the Army of Italy. Now, I have heard from many Surgeons, and from M. Larrey himself, the head of them, that, on the contrary, there were very few cases. Moreover, this case of tetanus that is arrested, that begins again, that is again stopped, and as it were at the pleasure of the Surgeon, inspires me, I must say, with little confidence! Now here are three cases spoken of; two die after ordinary treatment, and the third recovers under the use of woorara. Now, I have had at La Charité three cases of tetanus in the course of 1857 and 1858; and of these two died and the third recovered, just as happened at Turin. It is these cases of recovery that have given a temporary reputation to numerous means of cure which have been vaunted as efficacious in tetanus, and which have, nevertheless, left the disease almost constantly a fatal malady. A single fact—and I only see one here—is worth little in therapeutics." The physiological effects of woorara as an antidote to the symptoms produced by strychnia, fully warrant us in making further careful experiments of a similar kind to the one here spoken of. Such experiments are rational, and founded on the most legitimate scientific induction.

VITAL STATISTICS OF LONDON.

Week ending Saturday, October 1, 1859.

BIRTHS.

Births of Boys, 812; Girls, 766; Total, 1578.
Average of 10 corresponding weeks, 1849-58, 1621.3.

DEATHS.

	Males.	Females.	Total.
Deaths during the week	492	522	1014
Average of the ten years 1849-58 ..	604.5	535.8	1260.3
Average corrected to increased population
Deaths of people above 90	1	2	3
Deaths in 15 General Hospitals	41	22	63

DEATHS IN SUB-DISTRICTS FROM EPIDEMICS.

	Popula- tion, 1851.	Small pox.	Mea- sles.	Scar- latina.	Diph- theria.	Whoop- ing- Cough.	Dia- rrhoea.	Ty- phus.

TO CORRESPONDENTS.

A Lecture by Dr. Simpson is in type, but the proof had not been returned at the hour of going to press.

D. H.—Three persons died of hydrophobia in 1837, five in 1856, fourteen in 1855, and as many as twenty-five in some previous years.

Mr. Atkinson should make his application to the Registrar, Soho-square, by letter, giving the date of his diploma.

Dr. M'C.—There would be great inconvenience in publishing a yearly Pharmacopoeia. By the time the druggists were accustomed to one, another would be issued.

W.D.G., Wakefield, will oblige us by sending a copy of the advertisement in which we are stated to recommend a work on "nervous debility," by a Mr. Smith, of Burton-crescent.

Mr. Sedon.—In 1754, Lacordière wrote of the small-pox, "that it destroyed, mutilated, and disfigured one-fourth of the human race." A hint this to the wisecracks who disbelieve in the utility of vaccination.

F. F.—21,403 unnatural deaths take place every year in London. The average rate of mortality in London during five years 1849-53, was 57,592, whereas the deaths, according to rates of mortality prevailing in certain districts of England, should not have exceeded 36,179.

J. P.—The Annual Circular of the Medical Directory was, as usual, issued the first week in August, and we are glad to hear that it was more generally responded to than on any former occasion. Accuracy can be only ensured by the strictest regularity in making the annual returns, and a few moments are well spent in contributing to the completion of so important a work of daily reference.

W. T.—The paper alluded to by our correspondent is by "T. Smethurst, M.D." dated Beak-street, Regent-street, June 1, 1844. We do not know if this is the same Dr. Smethurst now under sentence. It was published in the *Lancet* of June 22, 1844, and entitled "On the Excision of Teeth." It occupies a little more than a column, and describes a case in which some inflammation about the mouth and face followed the cutting away of an incisor-tooth at the level of the gum, and pivoting an artificial tooth on to the stump. In the same number of this Journal is an article by Fresenius, "On the Detection of Poisons generally in Medico-legal Inquiries, and on a new and perfectly satisfactory Method for the Detection and Quantitative Determination of Arsenic." This article is commenced in the preceding number of the Journal, and the author shows that if an animal be poisoned by sulphuret of potassium, the "presence of the poison cannot be traced after the lapse of some time," and that there are many other poisons, not only animal and vegetable, but definite chemical compounds, in which the chemist cannot be expected to prove the presence of the poison. In the paper of June 22, it is shown that the *pathological signs* are "indeterminate and uncertain" in cases of poisoning by "acetate of copper, tartar emetic, butter of antimony, sulphate of zinc, etc." In a continuation of this paper in the 29th of June the fallacy of Reinsch's process "in cases where nitrates, mercury-compounds, and other metallic combinations" are present, is pointed out.

ERRATUM.—No. 483, p. 346, for "Caleb Erums," read "Caleb Evans."

INVETERATE WARTS.

TO THE EDITOR OF THE MEDICAL TIMES AND GAZETTE.

SIR,—With reference to a letter in your last number, headed as above, I would recommend "A Constant Subscriber" to try the following measures for the eradication of warts:—

With a hair pencil apply a drop of aromatic vinegar or the strongest acetic acid to the warts each night and every morning; while washing, rub them well with a nail brush. Their disappearance may be expected in a few days.

October 3, 1859.

I am, &c. ALIQUIS.

TO THE EDITOR OF THE MEDICAL TIMES AND GAZETTE.

SIR,—In answer to "A Constant Subscriber" enquiring for a cure for inveterate warts, glacial acetic acid will not disappoint him, and if he finds the same obstinacy in venereal warts, a single application of the same acid will probably prove as successful with him as it has with me, but much depends on the purity of the acid.

Victoria-park-road, Hackney, N.E., Oct. 3, 1859.

I am, &c. G. F. G.

TO THE EDITOR OF THE MEDICAL TIMES AND GAZETTE.

SIR,—Your correspondent "A Constant Subscriber" asks for a remedy for a crop of warts on the hand. I should recommend him to try the constant application of water-dressing for two or three weeks, which application, to my surprise, cured a very large crop on the back of a patient's hand, to which I had ordered the water-dressing on account of a wound on the palmar surface. Should the application succeed in the case of "A Constant Subscriber," it would be interesting to the Profession were it made known.

October 1, 1859.

I am, &c. H.

TO THE EDITOR OF THE MEDICAL TIMES AND GAZETTE.

SIR,—I think "A Constant Subscriber" will find his warts yield to the application of a saturated solution of alum in sulphuric ether. It was given me many years since by a very distinguished chemical friend, and I have very rarely found it fail; and recently I used it for a wart-like growth on the thumb of a near relation's hand, which had resisted all ordinary means of removal, and which, from its being situated on the inner aspect of the thumb, was a most serious inconvenience.

I am, &c. L.R.C.P.

TO THE EDITOR OF THE MEDICAL TIMES AND GAZETTE.

SIR,—The best application to warts is a solution of chromic acid of the strength of two drachms and a-half to the ounce of water. A crystal of bichromate of potash moistened with water answers very well.

London, October 4, 1859.

I am, &c. W.

"AUDI ALTERAM PARTEM."

TO THE EDITOR OF THE MEDICAL TIMES AND GAZETTE.

SIR,—Will you allow me through your medium to call the attention of your correspondent *ιαρρός* to the following bye-law of the Royal College of Physicians of Edinburgh, which I copy verbatim: "If any Fellow or Licentiate of the College shall by himself, co-partner or servants, keep a public Apothecary's, Druggist's, or Chemist's shop he shall, *ipso facto*, forfeit all the rights and privileges which he does or may enjoy as a Fellow or Licentiate of the said College, and his name shall be expunged from the list." It is quite evident then that the professional tradesman he alludes to is acting in direct opposition to this bye-law as well as the statement all candidates for the licence are called upon to sign.

I am, &c.

JOHN E. SMYTH, B.A. L.R.C.P.E.

2, China-terrace, Lambeth, October 1, 1859.

COMMUNICATIONS have been received from:—

PROFESSOR SIMPSON; Mr. TEALE, Leeds; Dr. KING; REGISTRAR-GENERAL; Mr. ATKINSON, Jerusalem; Dr. COLLINGWOOD; Dr. R. D. THOMSON; Dr. STRUTHERS; Dr. GARROD; MEDICAL OFFICERS AND LECTURERS, Westminster Hospital; Mr. FIRTH; Dr. WEIR; Mr. SCOTT; Dr. McCORMAC, Belfast; PRESIDENT OF ST. THOMAS'S HOSPITAL; Dr. MOORE; THE LECTURERS, Middlesex Hospital; Dr. WOLFE; Dr. DYSTER; Mr. NORRIS; Mr. BENNETT; Dr. S. RIDING; Mr. RIVERS; Mr. COPNEY; Mr. J. MICHELL; Dr. SMYTH; Mr. TUSON; Mr. E. OLDFIELD, St. Petersburg; Mr. DEANE; PRESIDENT AND COUNCIL OF COLLEGE OF DENTISTS; Dr. BUCHANAN; Mr. REDFERN DAVIES; Mr. THORLEY; Mr. DEMPTON; Mr. LETTS.

APPOINTMENTS FOR THE WEEK.

October 8. *Saturday (this day).*

Operations at St. Bartholomew's, 1½ p.m.; St. Thomas's, 1 p.m. King's, 2 p.m.; Charing-Cross, 1 p.m.

10. *Monday.*

Operations at the Royal Free Hospital, 1 p.m.; Metropolitan Free Hospital, 2 p.m.

MEDICAL SOCIETY OF LONDON, 8 p.m. Henry Thompson, Esq., F.R.C.S. "On Internal Urethrotomy in Obstructive Stricture of the Urethra."

11. *Tuesday.*

Operations at Guy's, 1 p.m.; Westminster, 2 p.m.

12. *Wednesday.*

Operations at University College Hospital, 2 p.m.; St. Mary's, 1 p.m. Orthopaedic Hospital, 2 p.m.; Middlesex, 12½ p.m.

13. *Thursday.*

Operations at St. George's, 1 p.m.; Central London Ophthalmic, 1 p.m. London, 1½ p.m.; Great Northern, 2½ p.m.

14. *Friday.*

Operations, Westminster Ophthalmic, 1½ p.m.

EXPECTED OPERATIONS.

King's College Hospital.—The following operations will be performed this day (Saturday):—

Mr. Ferguson—Removal of Dead Bone from Finger; Ditto from Tibia; Ditto from Stump; Excision of Hip; For Ununited Fracture; For Nevus. Mr. Bowman—Lithotomy.

Westminster Hospital.—The following operations will take place on Tuesday next, at 2 o'clock:—

Mr. Holt—Necrosis of the Tibia; and two Cases of Stricture of the Urethra.

Queen's University in Ireland.

QUEEN'S COLLEGE, GALWAY.
SESSION 1859-60.
FACULTY OF MEDICINE.

The Matriculation Examinations, in the Faculty of Medicine, will commence on Tuesday, the 18th of October.
Additional Matriculation Examinations will be held on Thursday, the 24th of November.

Matriculation is necessary for those Students only who intend to proceed for the degree of M.D. in the Queen's University, or to become Candidates for Scholarships, Exhibitions, or Prizes in the College.

SCHOLARSHIPS AND EXHIBITIONS.

In the Faculty of Medicine six Junior Scholarships of the value of £20 each, and six Exhibitions of the value of £10 each, are appropriated as follows:—Two Scholarships and two Exhibitions to Students of the first, second, and third years respectively. Also, two Senior Scholarships of the value of £40 each, and two Exhibitions of the value of £18 each are appropriated to Students of the fourth year.

The Examinations for Scholarships and Exhibitions will commence on Thursday, the 20th October, and be proceeded with as laid down in the Prospectus.

In addition to the Scholarships and Exhibitions above mentioned, Prizes will be awarded by each Professor at the close of the Session.
Scholars of the first, second, and third years, are exempted from a moiety of the Class Fees.

The Medical School of Queen's College, Galway, affords ample means for the acquisition of Medical and Surgical knowledge.

MUSEUMS.—An extensive Museum, illustrative of Anatomy and General Pathology, Materia Medica, and Toxicology has been provided; and to facilitate the study of the Obstetric branch of Medical Science, the College has purchased the Montgomery Museum.

HOSPITALS.—The Hospitals, to which Students are admitted, contain 200 beds, and are visited every morning by the Medical Professors, who deliver Clinical Lectures.

In order to induce Medical Students to attend the practice of the Hospitals during the entire course of their education, the fee for Hospital Attendance and Clinical Lectures conjointly has been reduced to £2 for each Session.

COLLATERAL SCIENCES.—Laboratories and every requisite appliance exist for the cultivation of Chemistry and Natural Philosophy. The College is furnished with a Museum of Natural History, and a Botanical Garden. Botanical excursions are conducted by the Professor in the proper season.

Further information may be had on application to the Registrar, from whom copies of the Prospectus may be obtained.

By Order of the President,

1st September, 1859. WM. LUPTON, M.A., Registrar.

University of Glasgow.—The Winter

SESSION commences on TUESDAY, NOVEMBER 1, and terminates on the last WEDNESDAY in APRIL. The various Classes meet as stated below.

Surgery, 5 p.m.—Dr. Lawrie.

Practice of Physic, 10 a.m.—Dr. MacFarlane.

Chemistry, 10 a.m.; Practical Chemistry, 12 noon; Analytical

Chemistry, 9½ a.m. till 4½ p.m.—Dr. Thomas Anderson.

Anatomy, 11 a.m.; Anatomical Demonstrations, 1 p.m.; Practical

Anatomy, 10 a.m. till 4 p.m.—Dr. Allen Thomson.

Botany.—Dr. Walter Arnott.

Forensic Medicine, 12 noon.—Dr. Rainy.

Materia Medica, 2 p.m.—Dr. J. A. Easton.

Midwifery, 3 p.m.—Dr. Pagan.

Eye (Waltonian Lectures), 6 p.m.—Dr. Mackenzie.

Institutes of Medicine, 4 p.m.—Dr. Buchanan.

CLASS FEES.—For each Class, £3 3s. with the following exceptions, viz. Practical Anatomy, six months (when taken along with Lectures on Anatomy), Practical Chemistry, three months, and Lectures on the Eye, each, £2 2s.; Analytical Chemistry, £4 4s. for three months, including apparatus and re-agents.

ROYAL INFIRMARY.—Visit daily at 8½ a.m. Clinical Lectures on Medicine, on Mondays and Thursdays, and Clinical Lectures on Surgery, on Tuesdays and Fridays, at 9 a.m. Fee for Two years, or Perpetual, £10 10s.; for One year, £5 5s. A deduction is made on these fees in the case of those who have previously attended an Hospital for eighteen months, or who hold a Medical or Surgical Diploma.

RECOGNITION BY PUBLIC BOARDS.—Attendance on the Lectures at the University of Glasgow qualifies for Examination at all the public Boards. Graduates in Surgery of this University are recognised by the English Poor Law Unions, and by the East India Company on the same footing as Licentiates of the Royal College of Surgeons of England.

The Lying-in Hospital, Dublin.

This Obstetric Hospital, the largest and only chartered one of the kind in the British dominions, contains 130 Beds, 15 of which are appropriated to the Diseases of Females.

An Obstetrical Museum (containing upwards of Five Hundred Preparations), and a Library, are attached to the Hospital; and a limited number of Intern Pupils can be accommodated.

The Master's Lectures are recognised by the Army and Navy Medical Boards, and all the various Licensing Bodies.

The Pupils of the Hospital are privileged to attend the Institution for Diseases of Children, Pitt-street, and the Cow Pock Institution, Sackville-street.

Terms of Attendance for Six Months:—

Intern Pupils Twenty Guineas.

Extern Pupils Ten Guineas.

Fee on Diploma Half-a-guinea.

The Lectures are delivered on Tuesdays, Thursdays, and Saturdays. Pupils can enter at any time.

Applications to be made to the Master, Dr. MCCLINTOCK at the Hospital.

Surgeons' Hall, Edinburgh.

WINTER SESSION 1859-60.

The INTRODUCTORY ADDRESS will be delivered by Dr. SKAE on November 2, at 2 p.m. The prospectus may be obtained on application to Dr. John Struthers, Secretary to the Medical and Surgical School.

Evening Demonstrations of Anatomy.

—Mr. CHRISTOPHER HEATH, Demonstrator of Anatomy at the Westminster Hospital, will resume his Evening Course of DEMONSTRATIONS and EXAMINATIONS upon the DISSECTED SUBJECT on Wednesday, the 5th of October. The Demonstrations take place on Monday, Wednesday, and Friday evenings, during the Winter Session, from Seven to Nine o'clock, at the Westminster Hospital. Entrance Fee (perpetual) Five Guineas.

IMPORTANT TO THE PROFESSION.

Those who cannot swallow Cod-Liver

OIL in its crude state should try NEWBURY'S COD-LIVER OIL CAKES.—"The gingerbread is extremely light and pleasant, the flavour of the oil being completely covered."—Medical Times, Feb. 12th, 1859. Packets, 1s. 9d. and 3s. F. NEWBURY and SONS (Proprietors of the "PULVIS JACOBI VER. NEWBURY'S.") 45, St. Paul's Churchyard, London. ESTABLISHED A. D. 1746.

Crosse and Blackwell, Purveyors in

Ordinary to Her Majesty, respectfully invite attention to their PICKLES, Sauces, Tart Fruits, and other table delicacies, the whole of which are prepared with the most scrupulous attention to wholesomeness and purity. The practice of colouring pickles and tart-fruits by artificial means has been discontinued, and the whole of their manufactures are so prepared that they are not allowed to come in contact with any deleterious ingredient. A few of the articles most highly recommended are, Pickles and Tart Fruits of every description, Royal Table Sauce, Essence of Shrimps, Soho Sauce, Essence of Anchovies, Jams, Jellies, Orange Marmalade, Anchovy and Bloater Pastes, Strasbourg and other Potted Meats, and Calf's-Foot Jellies of various kinds for table use. C. and B. are also sole agents for M. Soyer's Sauces, Relish, and Aromatic Mustard; and for Carstairs' Sir Robert Peel's Sauce, and Payne's Royal Osborne Sauce. The above may be obtained of most respectable Sauce Vendors throughout the United Kingdom; and Wholesale of

CROSSE and BLACKWELL, 21, Soho-square.

Superphosphate of Iron and Super-

PHOSPHATE of IRON and LIME. New Remedial Agents introduced to the notice of the Profession at the Meetings of the Medical Society of London, and now extensively employed by the most eminent members of the Medical Profession. The Syrup is the most eligible mode of administering these valuable Remedial Agents. Mr. GREENISH will be happy to forward a variety of cases which have been furnished to him, where its success has been most marked, and which will serve to indicate where it may be most advantageously employed.—20, New-street, Dorset-square.

Mr. Howard, Surgeon-Dentist, 52,

FLEET-STREET, has introduced an entirely NEW DESCRIPTION of ARTIFICIAL TEETH, fixed without Springs, Wires, or Ligatures. They so perfectly resemble the natural teeth as not to be distinguished from the original by the closest observer; they will NEVER CHANGE COLOUR or DECAY, and will be found very superior to any teeth ever before used. This method does not require the extraction of roots, or any painful operation, and will give support and preserve teeth that are loose, and is guaranteed to restore articulation and mastication; and that Mr. Howard's improvements may be within the reach of the most economical, he has fixed his charges at the lowest scale possible. Decayed Teeth stopped and rendered sound and useful in mastication. 52, Fleet-street. At home from Ten till Five.

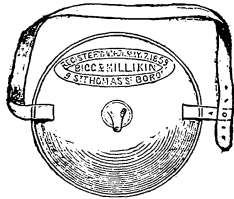

Wines from the Cape of Good Hope.

W. and A. GILBEY'S SOUTH AFRICAN PORT, SHERRY, &c. &c., 20s. per Dozen. First growths only. Two samples for 12 stamps. Wine Importers and Distillers, 357, Oxford-street, London (W.); 31, Upper Sackville-street, Dublin; and 12, St. Andrew-square, Edinburgh. Medical Reports, Price Lists, &c. sent post free.

Great Saving in the Purchase of New

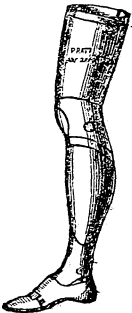

MEDICAL GLASS BOTTLES and PHIALS at the NORTH LONDON GLASS BOTTLE WORKS, ISAACS and SON (Proprietors)—London Warehouses, 24 and 25, Francis-st., Tottenham-court-road, W.C. 6 and 8 oz., any shape, plain, or graduated } clear { 8s. per gross. 3 and 4 oz. ditto } blue tinted { 7s. 6d. do. 1 oz. Moulded Phials } of a very { 4s. 6d. do. 1 oz. ditto } superior { 5s. 6d. do. 1 1/2 oz. ditto } quality. { 6s. 6d. do. 2 oz. ditto } { 7s. 6d. do.

A remittance not required till the goods are received. Packages free. Delivered free within seven miles. Post-office Orders payable to "S. Isaacs and Son," at Tottenham-court-road. Bankers: Unity Bank.

Registered No. 4171,

May 7th, 1859, by BIGG & MILLIKIN, 9, St. Thomas-street, Borough, MADAME HARRIOTE'S MAMMARY FEEDING BOTTLE, or Artificial Breast, by which an infant can receive its food in the most natural position, and be deceived by its pliable and soft texture. It has many advantages that none but a mother can appreciate.—To be had only at BIGG & MILLIKIN'S, Instrument Makers to Guy's and St. Thomas's Hospitals, 9, St. Thomas-street, Borough.

Pratt's Artificial Leg.

J. PRATT begs to call the attention of the Profession to the following Testimonial, just received:—

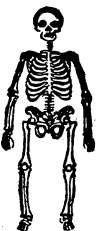

"Somerset,

June 20th, 1858.

"DEAR SIR,—It affords me much pleasure in being able to state that the Artificial Leg which you supplied me with is far beyond my best anticipations. From its being so LIGHT IN WEIGHT, and its action in the foot so natural, I can walk, or ride on horseback, with ease and comfort; and few indeed would detect it as being other than natural. It has given me full satisfaction.

I am, dear Sir, yours very truly, J. W.

To Mr. J. Pratt, Surgical Instrument Maker, 420, Oxford-street."

Human Osteology from France,

RAGINEL, 38, Ludgate-hill, City, E.C., London. Patronised by the Royal College of Surgeons of England. Illustrated Osteology on the bones themselves. Very large Stock on the lowest possible terms. Disarticulated Skulls, in twenty-two pieces, in box. All the bones of the disarticulated skulls will be fitted in right order in the presence of the purchaser so as to shew that every bone of each set belongs to the same Skull; it will be the same for all other disarticulated pieces. Skulls with Sections. Hands and Feet on catgut. Disarticulated Skeletons, quite complete, with the Skull same body. Articulated Male Skeletons, the bones very well marked. STUDENT'S CASE OF OSTEOLOGY, COMPLETE. Splendid Pieces for Lecturers and Museums.

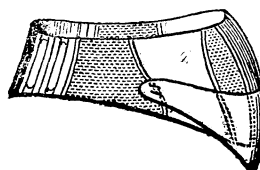

Professors of Anatomy and STUDENTS

are invited to inspect the Stock of Skeletons, Skulls, separated and entire—Vertebrae, Hands and Feet on catgut, and various loose bones, which are well prepared, perfectly white, and free from grease or smell. The selection of this stock having been made by a good Anatomist, W. M. can confidently recommend them as being well marked, perfect bones, at low prices.

W. MATTHEWS, 8, Portugal-street, Lincoln's-inn-fields, London.

J. & E. BRADSHAW, late

Shoolbred and Bradshaw, 34, Jermyn-STREET, begs to call attention to the various improvements in

PATENT ELASTIC STOCKINGS, BELTS, KNEE-CAPS, SOCKS, and Ladies' and Gentlemen's SPINE-SUPPORTERS. A new description of BELT invaluable for prevention of Cholera, and the cure of Rheumatism, Lumbago, &c. N.B. Every description of INDIA-RUBBER BANDAGE, vulcanized on the newest principle.

Directions for measurement sent by post. N.B. A liberal Discount to the Profession.

A female to attend on Ladies.

TRADE MARK.

Brown & Polson's Patent Corn Flour,

preferred to the best Arrowroot. DELICIOUS in PUDDINGS, CUSTARDS, BLANCMANGE, CAKE, &c., and especially suited to the delicacy of CHILDREN and INVALIDS.

The Lancet states—"This is superior to anything of the kind known."

Trade Mark and Recipes, on each Packet, 4, 8, and 16 oz.

Obtain it from Family Grocers, Chemists, &c.

77A, Market-street, Manchester; and 23, Ironmonger-lane, London.

Varicose Veins and Supporting Bands.

—SURGICAL ELASTIC STOCKINGS AND KNEE CAPS, per-vicious, light in texture, and inexpensive, yielding an efficient and unvarying support, without the trouble of lacing. Likewise, a strong low-priced article for Hospitals and the Working-Classes. ABDOMINAL SUPPORTING BANDS for both Sexes; those for Ladies' use, before and after accouchement, are admirably adapted for giving adequate support with extreme lightness—a point little attended to in the comparatively clumsy contrivances and fabrics hitherto employed. Instruction for measurement and prices on application, and the articles sent by post from the Manufacturers and Inventors, POPE and PLANTE, 4, Waterloo-place, Pall-mall, London, S.W.

The Profession, Trade, and Hospitals, supplied.

Williams and Son's Pure Glycerine

SOAP: Analysed by Dr. Hofmann, F.R.S., and Professor Redwood, Ph.D., strongly recommended by many eminent members of the Medical Profession, and favourably noticed by the following Medical Journals:—

THE LANCET.

THE MEDICAL TIMES AND GAZETTE.

THE BRITISH MEDICAL JOURNAL.

THE MEDICAL CIRCULAR.

EDINBURGH MEDICAL JOURNAL.

THE DUBLIN HOSPITAL GAZETTE.

It is suited to all cases of delicate skin (whether arising from disease or otherwise), and is admirably adapted for nursery use. May be had of all respectable Chemists, Perfumers, &c.

SOAP-WORKS, CLERKENWELL, LONDON, E.C.

Health, Fresh Air, and Pure Water.

—By Her Majesty's Letters Patent.—CONDY'S FLUID contains NASCENT OXYGEN, nature's true and only purifying agent; instantly removes all offensive smells; renders impure water fresh, and the air pure; when diluted for use, is of a beautiful colour, not soiling the finest linen; is harmless, and particularly adapted for toilet use, being both refreshing and exhilarating. The Medical Profession have expressed their unqualified approbation of its merits. One gallon makes 200 gallons adapted for use. The cooling, healing, gently stimulating and invigorating properties of this Fluid render it, when diluted, a lotion possessing peculiar and valuable characteristics, whether for bathing the bodies of invalids, incorporating in poultices, or washing and healing wounds. Patronised by the Board of Health, and most public departments, hospitals, schools, and adopted by the India Council in preference to all other disinfectants. In bottles, 6d. 1s. and 2s.; stronger and purer, 1s. 2s. and 4s.

CONDY'S PATENT HEALTH POWDER also contains NASCENT OXYGEN, is odourless, and destroys all smells; in bottles, 1s. 6d. and 3s., and in casks of 1 cwt. 36s.—Wholesale agents, John Bell and Co. chemists, No. 338, Oxford-st. W.; Butler and Crisp, 5, Cheapside, St. Paul's; Ferris and Co., Bristol.—Chemical Works, Battersea, S.W.

Struve's Seltzer, Marienbad, Vichy,

KISSINGEN, and other MINERAL WATERS.—Under her Majesty's special Patronage.—ROYAL GERMAN SPA, BRIGHTON, STRUVE'S PUMP-ROOM and PROMENADES, offering every facility for a Course of Mineral Waters, as perfect and beneficial as at the natural springs, are NOW OPEN, for the Thirty-fifth Season. A prospectus, with the highest Medical testimonials, may be obtained gratis, at the Pump-room, or from George Waugh and Co. Chemists to the Queen, 177, Regent-street (west side), London, and other respectable houses in London and the provincial towns, where orders for Struve's Bottled Mineral Waters continue to be executed.

CAUTION.—The success obtained by Struve's Mineral Waters, owing to their perfect identity with those of the natural springs, has induced several parties to attempt imitations, sold as "Brighton Seltzer," "Brighton Vichy," &c., an analysis of some of which has shown an utter disregard of their true chemical composition. To distinguish Struve's Waters from all others, every bottle has a label and red ink stamp over the cork, each bearing Struve's name, without which name none is genuine, though contained in Struve's old bottles.

Surgical Instruments. — Students

about commencing their studies at the ensuing Session can obtain, at BAILEY'S, 418, OXFORD-STREET, every description of Anatomical, Dissecting, Amputating and Pocket Instruments, of the very best quality, and at a moderate price.

Student's Dissecting Case, complete .. 10s. and 12s. 6d.
Post-Mortem Case £2 2 0
Pocket Cases, from 1 1 0
Case of Tooth Instruments 1 1 0

TRUSSES, ENEMAS, ELASTIC STOCKINGS, &c.

An Illustrated Catalogue will be sent free upon application.
W. H. BAILEY, 418, OXFORD-STREET, LONDON, W.

PURE SPIRITS FOR THE FACULTY.

S. V. R. 56 o.p., 16s. 6d. net Cash.—

This quotation admits of neither credit nor discount, and 1s. per gallon must be added for packages, to be allowed on their return.

HENRY BRETT and CO., Old Fumival's Distillery, Holborn.

WALTERS' INDIA-RUBBER URINALS.

F. WALTERS having originally invented these Urinals, begs to warn the Profession of the many bad and useless imitations which are now sold, and he would advise them, before purchasing, to look that they are stamped with his name; as, unless that be the case, he cannot guarantee them.

These conveniences are made for those who require them only occasionally, during a long journey, as well as for those invalids who use them always. MR. WALTERS has much improved them by making them of *Etherised India-Rubber*, which adds very greatly to the strength of the India-Rubber, at the same time that it prevents its sticking together; by this means he is enabled to make them less stiff and harsh than hitherto, and yet to retain all the advantages of that stiffness. There is a patent valve, which prevents the return of the fluid; and they may be worn either sitting, walking, or lying, without the slightest inconvenience, and without being perceived by any one.

WALTERS' CONVENIENCES FOR LADIES will be found particularly useful during pregnancy. They are perfectly soft and flexible, and may be worn with perfect comfort.

All Orders must be accompanied by a Post-office order or reference.—Entrance for Ladies at the private door, where a Female attends.

MANUFACTURER OF ELASTIC STOCKINGS, BELTS, &c.

16, MOORGATE STREET, NEAR THE BANK, LONDON. E.C.

DR. DE JONGH'S

(Knight of the Order of Leopold of Belgium)

LIGHT-BROWN COD-LIVER OIL.

OPINION OF

EDWIN LANKESTER, Esq., M.D., LL.D., F.R.S.,

Late Lecturer on the Practice of Physic at St. George's Medical School, Superintendent of the Food Collection at the South Kensington Museum, &c. &c.

"I have much pleasure in bearing testimony to the excellent qualities of the Cod-liver Oil prepared under the superintendence of Dr. De Jongh, of the Hague. "I believe that the purity and genuineness of this Oil are secured in its preparation by the personal attention of so good a Chemist and intelligent a Physician as Dr. De Jongh. He was the first Chemist who gave an accurate analysis of the Cod-liver Oil, and the discoverer of an organic substance which it contains.

He has also written the best Medical treatise on the Oil with which I am acquainted. Hence I should deem the Cod-liver Oil sold under his guarantee to be preferable to any other kind as regard genuineness and medicinal efficacy.—S. Savile-row, W., August 1st, 1859."

SOLE CONSIGNEES AND AGENTS,

ANSAR, HARFORD, & CO., 77, Strand, London, W.C.

WATER BEDS.—EDMISTON and SON, 5, Charing-Cross, beg to call

the particular attention of the Managers of Hospitals and Dispensaries, and the Medical Profession generally, to the prices and quality of their Hot or Cold Water Beds. The prices hitherto charged being so high as to limit the sale of such articles to the affluent, they are induced to offer them at such prices as will enable the public generally to realise the advantage and comfort to be derived from their use.

WATER BEDS, £3 13s. 6d., £5 5s., and £6 16s. 6d.

Water Pillows and Cushions, 7s. 6d. to 21s. Urinals, from 3s. 6d. to 12s. 6d. Cotton Elastic Stockings, 4s. 3d. Silk, 5s. 3d. Knee Caps, Leggings, Anklelets, &c.

BED SHEETS, ACCOUCHEMENT BELTS, &c.

India-Rubber Chamber Utensils for Lunatic Asylums, 7s. 6d. each, or 75s. per dozen.

WATER BEDS ON HIRE. TERMS, 7s. 6d. PER WEEK.

FALCON GLASS WORKS, LONDON.**

MEDICAL AGENCY.

NOTICE OF REMOVAL AND CHANGE OF FIRM.

Mr. Lara (for the last eight years the

sole representative of LANE and LARA, Medical Agents and Arbitrators and Lunatic Asylum Registrars,) begs to inform the Profession that, in consequence of the daily increasing support with which he has been favoured, and for which he tenders his sincerest thanks and acknowledgments, he has taken into PARTNERSHIP Mr. James Maxfield Walters, a gentleman who has had considerable experience in the business. It will, therefore, from and after Christmas, 1858, be carried on, under the Firm of LARA and WALTERS, at 6, PUMP-COURT, Middle Temple, E.C., whither they have removed their Offices from 22, Buckingham-street, Adelphi, in order to provide that larger accommodation which a constant intercourse with a great majority of the entire body of General Practitioners in England has rendered necessary.

Partnerships and Practices sold and valued: Asylums transferred: Arbitrations effected: Assistants provided (if for a permanence without charge to Employers); and every other description of business transacted for the Profession at a fixed and moderate cost. Attendance from 11 till 4.

Hospital for Sick Children, 49, Great

ORMOND-STREET.—A SERIES of LECTURES on the DISEASES OF CHILDREN will be given every SATURDAY during the months of NOVEMBER, DECEMBER, and JANUARY, by Dr. WEST, Dr. JENNER, and Mr. ATHOL JOHNSON, the Physicians and Surgeon of the Hospital. The First Lecture will be given on SATURDAY, NOVEMBER 12, at 3 p.m., by Dr. WEST.

The Lectures are open to Practitioners of Medicine, and to Students after their first year, on written application, addressed to the Secretary at the Hospital.

By order of the Committee of Management,
H. A. BATHURST, Hon. Secretary.

Private Establishment for the Insane,

CHURCH STRETTON, near SHREWSBURY. This Establishment is conducted by the Resident Proprietor, Dr. S. G. BAKEWELL, Son of the late Mr. Bakewell, of Spring Vale, Staffordshire.

The Ladies occupy a separate residence, and are under the immediate care of Mrs. Bakewell.

The neighbourhood of Church Stretton is very picturesque and healthy. Its similarity to Malvern is often noticed.

A Carriage is kept for the use of the Inmates.

References can be given to Medical Gentlemen and others in Shrewsbury, Birmingham, Hereford, and throughout Staffordshire.

Church Stretton is a first-class Station on the Shrewsbury and Hereford Railway, twelve miles from Shrewsbury.

An old-established General Practice in

a small Market Town in one of the Midland Counties to be disposed of for One Year's purchase of the gross cash receipts, viz. about £500. No public appointments, and only one opponent. No midwifery under £1 1s. A good introduction will be given. Apply to Mr. Nathaniel Smith, 373, High-street, Cheltenham.

Gainsborough Dispensary.—A House-

SURGEON is required for this Institution. He must be registered under the new Medical Registration Act. His duty will be found in the rules, an abstract of which may be had on application, post-paid, to W. H. Caldicott, Gainsborough. Salary, £90 per annum. A furnished house is provided, rent and taxes free, with an allowance of £5 for coals. Certificates of ability, &c. to be sent to Mr. Caldicott before the day of Election, which will take place at the Town-hall, Gainsborough, on Friday, the 21st day of October at eleven o'clock in the forenoon.

Gainsborough, September 20, 1859.

Liverpool Southern Hospital.—

WANTED, a JUNIOR HOUSE-SURGEON and APOTHECARY. Salary 60 Guineas per annum, (with a yearly increase of Ten Guineas to Ninety Guineas per annum.) Board and Lodging in the Hospital. Candidates are required to have the Diploma of one of the Royal Colleges of Surgeons, and the Licence of the London Society of Apothecaries. Applications, with Testimonials, to be addressed to James Houghton, Esq., Treasurer of the Hospital, on or before Thursday, the 13th of October.

N.B.—The Candidates whose Testimonials are satisfactory will have notice to appear at the Hospital on or before the day of Election.

Stockport Infirmary.—Wanted, an

ASSISTANT HOUSE-SURGEON and APOTHECARY. He must be a Member of one of the Royal Colleges of Surgeons, and a Licentiate of the Apothecaries' Hall. His duties will be to visit home patients and assist in the duties of the house. Engagement for two years, at a salary of £50 per annum, with Board and Apartments in the Infirmary. Testimonials to be sent prepaid to Mr. S. W. Wilkinson, Hon. Sec., at the Infirmary on or before the 28th of October. The appointment will be made on the 7th of November, 1859.

By Order of the Committee, S. W. WILKINSON, Hon. Sec.
Stockport Infirmary, October, 1859.

A well-educated Young Gentleman

can be received as a PUPIL in the house of a Married Medical Man (without family) in large general practice at the West End of London. Apply for terms to Charles Richardson, Esq., 15, Old Jewry Chambers, E.C.

A Second Year's Student at East End

of London, WANTS a SITUATION with a Surgeon, with liberty to attend Hospital Practice and Lectures, in return for Board and Lodging. Address, J. M. 9, Stonebridge-terrace, Haggerstone, N.E.

Medical Transfer and Partnership.

30, Bucklersbury, Cheapside.

Mr. Orridge, Medical Transfer Agent,

Referee, and Valuer of Medical Property, may be consulted, at the above Address, by Gentlemen about to receive PARTNERS, or to RELINQUISH or to COMMENCE Practice.

Mr. Orridge is known to many of the Hospital Physicians and Surgeons of London.

He has been concerned professionally for a considerable proportion of the most influential Practitioners (including Partners in many of the leading Medical Firms), to whom he has the satisfaction of being permitted to refer—a privilege that he trusts will be regarded as a proof of the sincerity of his endeavours to conduct these transactions in an honourable and straightforward manner.

Gentlemen desirous of obtaining Mr. Orridge's opinion, or requiring his attendance professionally in any part of England, can obtain terms on application, by (confidentially) transmitting name and address.

Office Hours, from Eleven to Four.

Royal College of Surgeons.—The

following are the days appointed for the Preliminary Examination in Classics, Mathematics, and French of Candidates for the Fellowship of this College, viz., Thursday, Friday, and Saturday, the 20th, 21st, and 22nd, inst. Further information upon the subject may be obtained upon application at the College. EDMUND BELFOUR, Secretary.

The London Medical Registration

ASSOCIATION.—The ANNUAL MEETING of this Association will be held at the FREEMASONS' TAVERN, Great Queen-street, Lincoln's-inn-fields, on Thursday, November 3rd, 1859, at 3 o'clock, p.m., the President in the chair. All Members of the Association are earnestly invited to attend.

THEODORE E. LADD, M.D., Hon. Sec.

Bath Mineral Water Hospital.—The

Situation of RESIDENT APOTHECARY having become VACANT by the resignation of Mr. CHARLES TERRY, the Committee will proceed to fill up the vacancy on THURSDAY, the 20th of October next.

Candidates must have Diplomas of the Apothecaries' Company and College of Surgeons, and are requested to send Testimonials of their Professional abilities and moral character (under cover) to the Registrar of the Hospital before Twelve o'clock on Thursday, the 13th of October.

The Salary is £100 per annum, with Board and Apartments in the Hospital.

September 29, 1859.

BENJAMIN STARR, Registrar.

Wallasey Dispensary.—A Duly-

qualified MEDICAL MAN, is required as HOUSE-SURGEON to the above Institution. Testimonials to be forwarded on or before the 20th inst. addressed under cover to the Secretary, WALTER D. PRITT, Hill-side, Wallasey, Cheshire. Each Candidate will be required to pledge himself, if elected, to continue in the appointment for a term of not less than three years. Salary, £100 per annum, with furnished house.

To the Medical Profession, Lecturers and

OTHERS.—Mr. J. C. STEVENS is instructed to sell by AUCTION on Wednesday, 19th October, at Twelve o'clock, on the premises, No. 27, Alfred-place, Bedford-square, A most RARE and VALUABLE MUSEUM of WAX MODELS and DRY PREPARATIONS, Collected at Florence, Rome, &c. containing many hundred Models of the Human Frame in Health and Disease, also a Medical Venus, and a splendid full-length figure with fœtus and other valuable models "en suite." On view the day before the Sale, and Catalogues had on the Premises, and at Mr. J. C. Stevens' Auction Rooms and Offices, 38, King-street, Covent-garden.

Pillischer's Achromatic Microscopes.—

To meet the daily increasing demand for his Microscopes, M. PILLISCHER has recently completed extensive alterations in his workshops to enable him to manufacture MICROSCOPES and their Object Glasses upon a more expeditious and extensive scale. M. P. has the pleasure of informing the Profession that he is now able to furnish Microscopes of the very greatest perfection; possessing every modern improvement; and with Object Glasses of a quality unsurpassed by any other maker, on the shortest notice, and at very moderate prices.

PILLISCHER'S £7 7s. STUDENT'S MICROSCOPE, for which a prize Medal was awarded to him at Paris Exhibition, 1855, deserves particular notice. It consists of a well-constructed Stand, with coarse and fine adjustments, a capital Stage, with Diaphragm and Large Mirror, one Eye-glass, one and one quarter inch Object Glasses, 16" and 75" angular aperture, and a neat Mahogany Case about 7 in. square. The above, Microscope when further completed with the addition of a Second Eye-glass, Condenser for Opaque Objects, Live Box, Stage Forceps, large Glass Stage, and Polarising Apparatus, price £10, forms a most complete and valuable Microscope, and in every respect as useful as a much more expensive one.

A Catalogue post free on application to M. Pillischer, Optician, 88, New Bond-street, London, W.

Microscopic Glass.—Thin Glass for

Mounting Objects, in squares or circles. Slides 3 in. by 1 in., and Cells of every kind, supplied Wholesale and Retail, by CLAUDET and HOUGHTON, 82, High Holborn, London.

London: Printed by CHARLES REED and BENJAMIN PARDON of 1, 2, and 3, Lovell's-court, Paternoster-row, in the City of London, and published by JOHN CHURCHILL, at the Publishing Office, No. 11, New Burlington-street, in the Parish of St. James, in the City of Westminster.—October 8, 1859.

Manual of Modern Surgery, the Eighth Edition, much enlarged, improved and illustrated by 328 highly-finished Wood Engravings.
London: Henry Renshaw, 356, Strand, and John Churchill, New Burlington-street.

Twelfth Edition, 24mo, cloth, 5s.
Selectæ Præscriptis. By
JONATHAN PEREIRA, M.D., F.R.S.
John Churchill, New Burlington-street.

Fifth Edition, two vols. fcap. 8vo, price 12s. 6d.
The Dublin Dissector, or System of
PRACTICAL ANATOMY, comprising a concise Description of the Bones, Muscles, Vessels, Nerves, and Viscera, also the Relative Anatomy of the different Regions of the Body; for the Use of Students in the Dissecting Room. By ROBERT HARRISON, M.D., V.P.R.C.S.I., M.R.I.A. Illustrated by 160 Engravings on Wood.

"A work highly and justly esteemed for its amount of information and clearness of arrangement and language. In its present enlarged and improved state it will supply every instruction that the student can require, and it will be the very best companion he can take to the dissecting-room."—William Lawrence, Esq., President of the Royal College of Surgeons, London.

"I have always considered the work the best of its kind; and in this new edition its superiority is, I find, much increased."—S. Wharton Jones, Esq., F.R.S.

"An elegant and valuable work, the companion equally of the lecture theatre and dissecting room."—Medical Gazette.

"Far above all other competitors in its own peculiar department." "It has no rival in any language."—Dublin Journal of Medical Science.
London: Longman and Co.

Fourth Edition, fcap. 8vo, price 12s. 6d.
Churchill on the Diseases of Women,
INCLUDING THOSE OF PREGNANCY AND CHILDBED.

"It has the testimony of our unqualified approbation. It surpasses any other that has ever issued on the same subject from the British press."—Dublin Medical Journal.

"A standard work of reference for the accoucheur and general practitioner."—Edinburgh Medical and Surgical Journal.

"As an epitome of all that is known in this department of Medicine, the book before us is perhaps the fullest and most valuable in the English language."—Dublin Medical Press.

London: Longman and Co.

Medical Diaries for 1860.—Those

published by LETTS, SON, and CO., are of more practical utility and cheaper than any of their contemporaries. Price 2s., in a neat cloth pocket-book, with clasp and pencil, and from 12s., in a superior Morocco or Russia wallet with places for instruments. Visiting lists are published independently, of four different sizes, at 1s., 1s. 4d., 1s. 8d., and 2s., per quire. Sold by all Booksellers and Stationers, and by Letts, Son, & Co., S, Royal Exchange, E.C. Descriptive catalogues gratis.

VOL. XL. No. 1046.—NEW SERIES, No. 485.

Just published, Second Edition, revised, with considerable Additions, post 8vo, cloth, 9s.

A Guide to the Practical Study of
DISEASES of the EYE. By JAMES DIXON, Surgeon to the Royal London Ophthalmic Hospital.

"This second edition is both enlarged and improved, and we can recommend the work to be really what it professes—A Guide—and a very useful and trustworthy guide—to the Practical Study of Diseases of the Eye."—Medical Times and Gazette.

In the Press, and shortly will be published, the Fourth Edition, considerably enlarged,

The Pathology and Treatment of STRICTURE of the URETHRA: its Complications and Effects. By R. WADE, F.R.C.S. John Churchill, New Burlington-street.

Just published, price 1s.,

Medical Science in its General Aspects and STUDY. A Lecture delivered at Guy's Hospital, at the Opening of the Session. By S. O. HABERSHON, M.D. Lond., Fellow of the Royal College of Physicians; Senior Assistant-Physician and Lecturer on Materia Medica and Therapeutics at Guy's. John Churchill, New Burlington-street.

8vo, cloth, 10 Plates, 9s.

On Dropsy connected with Disease of the KIDNEYS (Morbus Brightii), and on some other Diseases of those Organs, associated with Albuminous and Purulent Urine. Illustrated by numerous Drawings from the Microscope. By W. R. BASHAM, M.D., Physician to the Westminster Hospital. "Whether we have regard to the minuteness of observation and accuracy of delineation displayed in the accounts given of the cases themselves, or the masterly skill with which the important points of each are singled out for observation in the appended 'Remarks,' or to the admirable manner in which the progressive changes in the microscopic characters of the sedimentary deposits are displayed in the plates, we have no hesitation in recommending the book to our readers, as one whose perusal should not be omitted by anyone anxious to treat cases of albuminuria with comfort to himself or advantage to his patients."—Dublin Quarterly Journal of Medical Science.

John Churchill, New Burlington-street.

Just published, fcap. 8vo, cloth, 5s.

An Introduction to Clinical Surgery; with a Method of Investigating and Reporting Surgical Cases. By FURNEAUX JORDAN, Assistant-Surgeon to Queen's Hospital, Professor of Anatomy at Queen's College, Birmingham.

"Mr. Jordan's work is one likely to prove of great practical utility, and we cordially recommend it to the notice of our Profession."—Medical Times and Gazette.

"The publication of this work is very opportune for students now about to commence in our schools the study of Surgery. To them we earnestly recommend it as supplying, in a compact form, all that they require which any book can give for the purpose of becoming competent to analyse, duly value, and correctly register the phenomena of surgical affections, to the literature of which it is a highly interesting addition."—Dublin Quarterly Journal of Medical Science.

"The symptoms and phenomena of surgical diseases and injuries are carefully arranged."—Brit. and For. Med.-Chir. Rev. "It is written with great care and clearness, and will, without doubt, do its share—not a trifling one—of work in fitting the surgical student for the efficient practice of his art."—British Medical Journal.

John Churchill, New Burlington-street.

Just published, post 8vo, cloth, 4s. 6d.

Sketch of the Medical Topography, or CLIMATE and SOILS, of BENGAL and the NORTH-WEST PROVINCES. By JOHN MCLELLAND, F.L.S., F.G.S., Surgeon, Bengal Service. John Churchill, New Burlington-street.

COMPLETION OF DR. TODD'S CYCLOPÆDIA OF ANATOMY AND PHYSIOLOGY.

Now complete in 6 vols. 8vo, price SIX GUINEAS per set, pp., 5,350, illustrated with 2,553 Woodcuts,

The Cyclopædia of Anatomy and PHYSIOLOGY. Edited by ROBERT B. TODD, M.D., F.R.S., &c., Physician to King's College Hospital.

"Not only does the latter part of the work bring its contents up to the latest date of our knowledge, but the number and grouping of the articles have permitted some of the more recent to modify and complete the unavoidable deficiencies of the earlier ones on the same or kindred subjects. . . . It brings together a larger amount of information, is more carefully constructed, and more profusely illustrated, than any similar Dictionary or Cyclopædia hitherto published. Most of its materials are to a great extent inaccessible even to the scientific public; and many of its parts (we allude especially to its beautiful Essays on Comparative Anatomy) are still practically otherwise unpublished. Others of its articles are the choicest productions or studies of their several authors; who wrote little but what they had verified, and cared still less for that dangerous smoothness which sometimes beguiles the reader into a fancied knowledge of the subjects, and thus makes the fortune of the book at his expense. Lastly, most of the articles are singularly free from the vice of book-making; so much so, that the learning and historical research many of them involve would be little suspected by any one unacquainted with the subjects. . . . While we may certainly feel proud that researches so toilsome and costly as many incorporated in this work should have been undertaken and carried out (like the whole efforts of British Science) without any help from the Government or the public, and by the unaided efforts of individuals themselves, we cannot but express some obligations to the eminent firm by whom this truly national work has been finally completed and set before the public. Indeed we will go further, and add that they are strictly entitled not only to gratitude, but to a speedy sale of the whole impression of the Book. . . . Writers of Physiological Essays will, it is hoped take it as a friendly hint if we suggest that, before rushing into print with new and brilliant discoveries, they look into the pages of what we must, for years to come, regard as the text-book of British Physiology. . . . The publishers are quite entitled to expect a large and rapid sale for what is as incomparably the best, as it certainly is the cheapest, scientific work of the day—a work indispensable to the Physiologist and scarcely less so to the Physician." Medico-Chirurgical Review, Oct.

London: Longman, Green, Longman, and Roberts.

Fifth Edition, 8vo, price 15s.

Neligan's Medicines, their Uses and MODE OF ADMINISTRATION.

Besides numerous and important Additions, the entire work has been thoroughly Revised, and all the formulæ contained in the British Pharmacopœias are, now for the first time, given at length.

HOOPER'S URINALS,

WITH VALVE TO PREVENT LEAKAGE,

Constructed of a light porous material, unique in giving continuous and permanent pressure, can be accurately adjusted, and readily drawn over the parts requiring their use.

For Invalids, or Railway Travellers; whether Sitting, Reclining, or Walking; they are not affected by boiling water, and may, therefore, be easily kept clean.

WATERPROOF SHEETING, FOR PROTECTING BEDDING,

At a great Reduction in Price. It is soft and inodorous, and not acted on by Urine, Acids or Alkalis, and may be washed as Family Linen.

EXTRACT OF REPORTS from the Medical Department of the Three Presidencies of the Hon. East India Company; also Reports and Letters from numerous Members of the Medical Profession free by post.

ORIGINAL LECTURES.

A CLINICAL LECTURE ON A
FATAL CASE OF CONTRACTED BRIGHT'S
KIDNEY, WITH PERICARDITIS, ETC.

By GEORGE JOHNSON, M.D. F.R.C.P.

Physician to King's College Hospital, Professor of Materia Medica and
Therapeutics in King's College, London.

GENTLEMEN,—Let me direct your attention to the particulars of a case of Bright's disease, which we have lately had under our care in the Hospital, and which ended fatally a few days since. The subject of this history was a married woman, aged 59, and by occupation a cook, who was admitted into No. 7 Ward, on the 27th of June. She was very deaf, and on this account we had considerable difficulty in eliciting from her a clear history of her previous state of health; but we learnt that she had suffered repeated attacks of what she called "rheumatic gout," and also that several times during the last few years she had been ill with bronchitis. She now came to the Hospital on account of cough and shortness of breath.

She was a short fat woman, with florid cheeks, in which the minute tortuous vessels were thickly scattered over a sallow, waxy, smooth, protuberant surface. Her physiognomy pretty clearly indicated that she had partaken freely of the good fare which it had been her business to prepare for others.

I have already told you that she was suffering from cough and shortness of breath; her breathing, however, was at first neither very hurried nor very laborious, nor did her countenance indicate any great degree of distress. On auscultation we heard distinctly enough the sounds indicative of bronchitis, wheezing and loose crepitation were audible over the greater part of both lungs. But we heard something more, and that was a to-and-fro creaking friction sound over the region of the heart. We concluded, therefore, that the serous surfaces of the heart and pericardium were roughened by lymph, the result of recent pericarditis. In consequence of the thickness of the subcutaneous fat over our patient's chest, we could learn nothing from percussion of the probable amount of liquid effusion into the pericardium.

Now you are aware that the most frequent cause of pericarditis is that painful disease rheumatic fever, of which we have lately had so much in our wards. In this case, however, rheumatic fever was clearly not the disease with which we had to deal. For although our patient complained of pains in some of her joints, there was no swelling of the painful joints, there was none of the characteristic acid perspiration, nor had the urine, as we shall presently see, the physical characters which are commonly found in cases of rheumatic fever.

You will have seen that, as a rule, we examine, with more or less care, the urine of all the patients who are admitted into the physicians' wards, and, in particular, we ascertain the presence or absence of albumen. By this practice, which I recommend to you for your adoption, we sometimes discover the existence of renal disease which might otherwise escape detection. But in the particular case which we are now considering there was a special reason for the examination of the urine, in the existence of pericarditis without rheumatic fever. It is an acknowledged fact, that Bright's disease of the kidney ranks next to rheumatic fever as a frequent cause of pericarditis. It was possible, therefore, that having ascertained the presence of pericarditis we might find in the urine some evidence of the existence of renal disease.

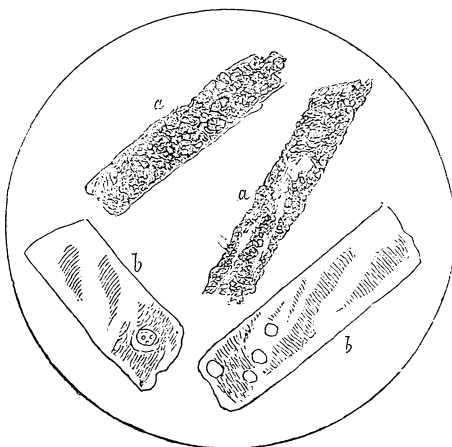

The urine was found to have the following characters. It was of very pale colour, its density was 1011, and it contained a small amount of albumen, the coagulum when allowed to subside occupied about one-twelfth of the liquid. The secretion of urine was scanty, but we could not ascertain the actual measure, for it was sometimes passed with the stools, and sometimes involuntarily in bed.

Now the question arose as to the relationship between the disease within the chest and the renal symptoms. It not unfrequently happens that patients who are labouring under a severe attack of bronchitis, have their urine impregnated with albumen in consequence of the congestion of the kidneys which results from a greatly impeded circulation through the

Vol. XL.—No. 1046.—NEW SERIES, No. 485.

chest. As the bronchitis subsides, and the pulmonary circulation again becomes free the albumen often disappears, to return again, perhaps, with a fresh attack of bronchitis. Was this the explanation of the albuminuria in the present case? We answered in the negative, for we have generally observed that when albuminuria is merely a secondary result of pulmonary engorgement, the kidneys being free from organic disease, the urine is of comparatively high density and of deep colour, and that it frequently deposits a copious sediment of lithates; whereas, in this instance the urine had the opposite character, a low density and very light colour. And relying upon these obvious physical characters of the urine, I ventured, with some confidence, to express an opinion that the kidneys were in an advanced stage of degeneration and atrophy, the result of that particular form of Bright's disease, which we designate the Chronic Desquamative Disease.

When the urine had stood for a time in a conical glass it deposited a considerable sediment of a light colour, which on microscopical examination we found to consist chiefly of broad scales of pavement epithelium from the uterus or vagina, but amongst these scales we saw here and there a granular and a large waxy cast, such as are represented in the accompanying diagram, and such as are rarely found together except in the advanced stage of this particular form of wasting Bright's disease.

a a Granular casts. b b Large waxy casts x 200.

Reviewing, now, all the circumstances of this history, we arrived at the conclusion that this most insidious of all the forms of Bright's disease had for a long but uncertain period, been making gradual progress, and that it had at length reached a very advanced stage. The urine, which, in the earlier stages of this form of disease, is always copious, had now become scanty in consequence of extensive structural degeneration of the kidney, and the bronchitis and the pericarditis were results of the contamination of the blood by urine. The prognosis was most unfavourable, the end could not be far off.

In the way of treatment there was little to be done; but in the hope of eliminating through the bowels some of the poisonous materials which the kidneys were failing to excrete, we gave a pill of calomel and colocynth, and subsequently, one-sixth of a grain of elaterium, made into a pill with extract of aloes. We were unwilling to push this purgative treatment unduly, on account of the obvious and great inconvenience attending the frequent action of the bowels in the case of a patient whose strength is failing, and who has a tendency to pass her evacuations involuntarily in bed. A linseed poultice was placed over the heart, the lumbar region was dry-cupped, and we endeavoured to support the patient's strength by a diet of milk with beef-tea, and a daily allowance of four ounces of brandy. We also gave a pectoral mixture containing chloric ether. Our remedies, as we had anticipated, were unsuccessful, and the symptoms rapidly increased in severity. The excretion of urine continued to be very scanty, the breathing became more hurried and difficult, and at the same time attended by loud rattles, which completely drowned the pericardial rubbing sound. On the 2nd July, the fifth

day after her admission, she had an epileptic seizure, followed by stertorous breathing and coma, which continued for some time. On the following day, she had another convulsive seizure, followed by a comatose condition, in which she died.

In the post mortem examination of the body we were not allowed to open the head.

The pericardium contained about twelve ounces of bloody serum, and both the visceral and parietal layers of the membrane were covered by rough lymph. The valves of the heart were healthy. The lungs were gorged, and the bronchi contained an abundance of frothy liquid. The kidneys were much reduced in size, their combined weight being only $5\frac{1}{2}$ ounces. Their surface was uneven, and finely granular. In short, the kidneys had all the characteristic appearances which are commonly found in cases of chronic desquamative disease.

I have already alluded to the fact that this atrophic form of Bright's disease is most insidious in its origin and progress. In the majority of cases, as in this instance, it passes through all its stages without the occurrence of dropsy in any form or in any degree. I find from a careful analysis of cases which have come under my own observation, that excluding all cases in which there was the complication of cardiac disease which might occasion dropsy, this symptom had been present in only fourteen out of thirty-three fatal cases of contracted Bright's kidney, and in most of these cases the dropsy had been very slight and partial. It can rarely happen that any Practitioner would prescribe for a case of dropsy, without investigating the condition of the urine; but it may very frequently happen, when dropsical symptoms are not present, that the urine is not examined, and the existence of advanced renal disease is not suspected.

There is another feature of this chronic desquamative disease, this atrophic form of Bright's disease, which it is important to bear in mind in cases of doubtful diagnosis. I allude to the fact that the urine is by no means constantly albuminous in this class of cases. Albumen may be absent, not only in the early stages of the disease, but even in its most advanced stages. Fortunately, this absence of albumen is not common, but it is of sufficiently frequent occurrence to give additional importance to the study of the microscopic characters of the urine, as an aid to diagnosis and prognosis in all cases of renal disease. The value of the evidence afforded by the various kinds of tube-casts is becoming very generally recognised, both in this country and on the continent of Europe, as well as in America, and this, too, in spite of the opposition of some few writers, who appear to be too indolent to master the details of the subject, or too prejudiced to form a right estimate of its importance.

In the treatment of this chronic desquamative disease it is of the first importance to discover the affection at the earliest possible period. We cannot hope to reconstruct a thoroughly degenerated and wasted kidney, but we may, by timely treatment, do much to arrest or retard the progress of those degenerative changes, which slowly but at length completely destroy the secreting structures of the gland. There is a very close, though not a constant connexion, between this form of renal disease and gout. Our patient had suffered from "rheumatic gout," and if you carefully examine the urine of patients who have had repeated attacks of gout, you will frequently find in it the granular tube-casts, indicating the commencement of those destructive changes in the renal gland-cells, which constitute the origin and the essence of this atrophic form of Bright's disease. Now is the time, while these microscopic appearances in the urine constitute the only evidence of renal disease, when treatment may be beneficial. A strict attention to diet and regimen is of the first importance. A gouty patient, in whose urine the signs of incipient renal disease are discoverable, has more than ordinary need to avoid all errors and excesses in food and drink. He should abstain from all kinds of malt-liquors and from port-wine; and if he require any stimulants, he should take brandy or sherry or claret in very moderate quantities. The skin should be kept clean and active by daily tepid ablutions, by woollen under-clothing, and by such an amount of exercise out of doors, short of fatigue, as the patient's strength and the weather and other circumstances will permit. The bowels should be carefully regulated by mild vegetable aperients, such as the compound rhubarb or colocynth pills, with which half-a-grain or one grain of acetous extract of colchicum may

be usefully combined. The vegetable bitters are often needed to give tone to the stomach, and when there is a great excess of acidity in the gastric fluids and in the urine, it may be well to give moderate doses of the bicarbonate of potash from two to three hours after the principal meals.

I have here sketched in outline a plan of treatment which, if judiciously and perseveringly carried out, may have much influence in checking the progress of this insidious disease towards that fatal disorganisation which it had unfortunately reached in the case which we have now been discussing.

ORIGINAL COMMUNICATIONS.

A CASE OF

CANCER OF THE STOMACH

ASSOCIATED WITH

TUBERCULAR DISEASE OF THE LUNGS.

By CHARLES T. COOTE, M.D. F.R.C.P.

Assistant Physician to the Middlesex Hospital.

ALTHOUGH it is now known for certain that cancer and tubercle may coexist in the same individual, yet the coincidence is of sufficient rarity to render it desirable to accumulate instances of the fact.

F. G. aged 60, a "painter's jobber," was admitted into the Middlesex Hospital on the 10th of August, 1858, under the care of Dr. Goodfellow, to whose kindness I am indebted for the notes taken during life, and which add so greatly to the interest of the post-mortem examination.

When admitted, the man was emaciated, pallid, with dropsical legs, and complaining of a "troublesome cough, worse at night." His then illness was of eight or nine weeks standing; but he had been ailing long before.

There was "dulness on percussion over the apex of each lung, limited in extent, but greater on the left than on the right side; slight bronchial respiration and increased vocal resonance."

On the next day, attention was drawn to the abdomen, where was detected "an irregularly circumscribed, indurated, tumour; slightly moveable by change of posture; extending from the umbilicus to about three inches upwards and to the left." He complained of some pain in this spot, which, however, was relieved by a dose of castor oil, and which never returned. This tumour was supposed to be malignant; and from its situation and from the absence of any symptom referable to the stomach or the liver, Dr. Goodfellow came to the conclusion that it was situated in the omentum, and probably involved a portion of the transverse colon.

From this time until the man's death (which took place on the 20th October from exhaustion and general dropsy), no change of any moment occurred. He retained throughout an excellent appetite, and was placed successively on broth diet, fish diet, and ordinary diet; he then had milk diet with a chop; and was particularly fond of gruel, of which he ate largely on the day of his death. During all this time he never once vomited, nor complained (after the castor-oil) of pain in the abdomen.

I extract from my own notes such portions of the autopsy as bear upon the chief points of the case.

Right lung: pleura adherent at posterior part of the upper lobe. The adhesions, easily broken down, consisted of recent lymph, and of a number of minute whitish granulations, about as large as pins' heads. Both the upper lobes were highly congested, but floated in water. The lower lobe was of a deep violet colour, very friable, and sinking in water.

The left lung was small, pale, collapsed, free from pleural adhesions. On section, the upper lobe was found to be profusely studded with grey miliary tubercles interspersed with a large amount of pigment. Among these was a much smaller proportion of yellow tubercles; and of these some had undergone softening, leaving small cavities, none larger than a pea. The lower lobe was emphysematous.

Under the microscope these tubercles presented the usual elements; small, shrivelled, angular nuclei, microscopic granules, and (in the yellow tubercles) fat.

The abdomen being opened, "On the anterior surface of

the right lobe of the liver, just beneath the ensiform cartilage, appeared a solid mass of a yellow colour, as large as a walnut, and with an ulcerating surface. In other parts of the liver were numerous similar masses, varying in size from that of a pea to that of a pigeon's egg.

"The stomach (which was firmly adherent to the liver, to the spleen, and to the transverse colon) was of normal size. Its walls, with the exception of the extreme fundus, and the pylorus itself, consisted of a hard unyielding substance, about three-quarters of an inch in thickness, the internal surface of which was in a state of uniform ulceration. On section this structure was found to occupy all the coats of the stomach, except the peritoneal, which was unaffected. The extreme portion of the fundus appeared quite healthy. The œsophagus was healthy."

These structures were examined microscopically.

The yellow masses in the liver consisted essentially of large nuclei containing one or two very large, and very distinct, nucleoli. With these were many polygonal cells in various stages of degeneration.

The structure occupying the walls of the stomach presented to the naked eye a greyish translucent substance, interspersed with small opaque masses of a yellow colour. The former consisted of a loosely reticulated fibrous stroma containing nuclei exactly resembling those described above, microscopic granules, and a few rather small cells containing large nuclei. The opaque yellow substance consisted of microscopic granules (very numerous), of fat, and of structureless corpuscles not distinguishable from colloid.

"The intestines were quite normal, except where the transverse colon was adherent to the anterior wall of the stomach; at which spot it was contracted to the extent of half its diameter."

In this case there appear to be several points of interest, irrespective of the mere coincidence of tubercle and cancer:—

1. The manner in which the two diseases manifested themselves contemporaneously during life.—On admission the man's complaint was of cough. Attention was only subsequently directed to the abdomen, by the complaint of pain; and, as this symptom was relieved by castor-oil, it seems probable that it was referable rather to the constricted transverse colon than to the diseased stomach itself.

2. As before stated, there was no symptom of any disease of the stomach during the time that the man was in the Hospital.—His appetite was good, he complained of no pain in the situation of the stomach either before or after taking food, and there was an entire absence of nausea or any inclination to vomit. His bowels acted regularly once or twice daily. The anæmic state of the patient, the dry and parchment-like appearance of his skin, the general innutrition notwithstanding the seemingly due performance of the digestive process; and the anasarca (no albuminuria or other positive sign of disease of the kidneys or heart being present); all these signs, taken in connection with the existence of the abdominal tumour, led to the conviction that the man was labouring under malignant disease, and that it was probably associated with tubercular disease of the lungs.

3. The situation of the cancerous growth in the stomach was very unusual; neither the extreme fundus nor the pyloric orifice being affected.

4. The fact that the two diseases (cancer and tubercle) must have gone on simultaneously.—Whatever may have been the date of the first deposit of tubercle in the apex of the left lung, some portions of it had certainly undergone recent softening; and other portions (in the stage of yellow tubercle) were possibly advancing towards the same event. This state of retrogressive transformation is very analogous to, if not identical with, that change of a cancerous deposit which is called its "ulceration." Moreover, simultaneously with these changes, recent tubercular exudation had occurred in the pleura investing the apex of the opposite lung.

CLINICAL MIDWIFERY.

By ROBERT LEE, M.D. F.R.S.

Obstetric Physician to St. George's Hospital.

(Continued from p. 331.)

Case 584.—Mrs. P. on July 25, 1849, at four a.m., being at the full period of her sixth or seventh pregnancy, the liquor amni escaped. At seven a.m. I ascertained that the

nates presented. The labour continued during the whole day, and at ten p.m. she was greatly exhausted, and the nates had not passed through the brim of the pelvis. There was no chance of the child ever being born by the natural efforts, and by no means, consistent with the safety of the child and mother, could I succeed in drawing the nates into the cavity of the pelvis. After a consultation with Dr. —, a blunt hook was passed with great difficulty over the left groin, between the thigh and trunk, and great force was required to draw the head through the pelvis. The uterus was so firmly contracted upon the child, that it was not considered safe to force back the nates and attempt to bring down a lower extremity. No bad consequence followed.

Case 585.—July 26, 1849, flooding some time after the expulsion of the placenta with Mr. — in Charlotte-street. He had left the patient, and on returning found an immense hæmorrhage with the uterus distended with blood. Passed his hand and removed all the clots. Hæmorrhage went on, and the patient was nearly dead. When I saw her there was no binder round the abdomen. I applied a pad and strong bandage, ice externally, and gave brandy-and-water liberally, and the patient recovered.

Case 586.—July 26, 1849, about mid-day a lady at the Terrace, Kensington, nearly seven months pregnant, was suddenly seized with uterine hæmorrhage. The day before she had been driving on a rough road. Mr. Haden soon saw her, made an examination, and felt the placenta. I saw her at his request about half-past four o'clock in the afternoon. The os uteri allowed two fingers to be introduced. No hæmorrhage, no faintness, no pain. Felt a portion of the placenta on the left side; on the right the membranes and the limbs of the fœtus. I recommended immediate delivery if the hæmorrhage should return, by passing two fingers through the os uteri and seizing one of the lower extremities. At three a.m. the flooding again returned suddenly, at which time the delivery was effected by Mr. Haden, by laying hold of a foot with two fingers. The whole hand was not introduced. The head passed without much difficulty, the placenta was adhering firmly, and a good deal of difficulty was experienced in getting it away. All the placenta was attached except the little portion that we felt through the os uteri. In this case I think it would have been the best practice to have delivered at half-past four p.m. No good resulted from waiting till the following morning, when much blood was lost.

Case 587.—Mrs. P. —, Thursday, October 24, 1849, labour commenced at two a.m., full period. Os uteri fully dilated, membranes ruptured. At four, difficulty in ascertaining the presentation. Ascertained to be preternatural at six, a hand of the fœtus, then felt. Passed up my left hand into the uterus, seized a foot, turned and delivered. The head drawn through the brim with great difficulty. Child dead. It was known, from previous observation before the labour commenced, that the pelvis was small, and the propriety of inducing premature labour had been considered.

Case 588.—At nine the same evening, called to Mrs. — Ovington-square, Brompton. Os uteri fully dilated, feet presented, slowly extracted them, the breech and trunk, cord thrice round the neck, great difficulty in extracting the head. The child did not breathe for some time, but at last did so—a small child.

Case 589.—On the 27th October, 1849, Mr. Booth, of Great Queen-street, Westminster, requested me to see Mrs. S —, who had been in labour 48 hours with her third child, at the full period, and whose pelvis was distorted in the highest degree from mollities ossium. After perforating the head, which had not entered the brim of the pelvis, I succeeded, after more than two hours' exertion, in tearing the bones in pieces with the crotchet and extracting them. The partially dilated state of the os uteri greatly increased the difficulty and danger of the operation. The patient recovered without any unfavourable symptom. Her lameness, which had commenced four years before, gradually increased after this confinement.

Case 590.—At the beginning of December, 1852, I was informed by Mr. Booth that this patient was again pregnant and in the fifth month. Several of the usual symptoms of pregnancy were wanting, and in consequence of this it was resolved to postpone for another month any interference. On the 5th of January, 1853, I again saw this patient with Mr. Booth, when the movements of the fœtus could be distinctly felt, and the necessity of immediately attempting to induce

premature labour was obvious and urgent. The tuberosities of the ischio were almost in contact, and the sacrum, projecting forward so much as nearly to touch the front of the pelvis. The impression made upon my mind was, that I had never before in practice encountered such a case of distortion of the pelvis, or one in which so much difficulty would be experienced in reaching the os-uteri, introducing the stilet catheter, and puncturing the membranes. After a time, the fore and middle fingers of the left hand were passed into the vagina, and I succeeded by pressing forward its anterior wall with the middle finger, in touching the anterior lip of the os uteri with the point of the forefinger, and by means of this the instrument was guided into the cavity of the uterus and the membranes punctured. The liquor amnii immediately began to escape, and continued flowing till the morning of Friday, the 7th of January, at 4 o'clock, when labour pains commenced. At 2 p.m. the os-uteri was so much dilated that the points of two fingers could be introduced and the fact ascertained that the head did not present, but whether it was the shoulders or nates could not be determined. At 7 p.m. the right hand was hanging out of the external parts and the shoulder and thorax had sunk deeper into the pelvis than it had appeared possible for them to do before the labour commenced. We found on carefully examining that the tuberosities of the ischio had been pressed to a considerable distance apart, in consequence of which the short diameter of the outlet was increased, and that the bones at the brim had also somewhat yielded to the pressure, and that the distance from the sacrum to the symphysis pubis had been likewise increased. Mr. Booth having drawn down the shoulder as low as possible, I removed the viscera of the thorax with the crotchet, and afterwards fixing its point on the spine, as near as possible to the pelvis, succeeded, after strong traction, in drawing the nates and lower extremities through the pelvis of the mother. The other superior extremities of the fetus soon followed, and little difficulty was experienced in crushing and extracting the head. The placenta soon followed, and on the 29th of January I had the satisfaction of receiving the following report from Mr. Booth three weeks after delivery:—

"3, Great Queen-street, Westminster,

"Jan. 29, 1853.

"My dear Sir,—Mrs. S—— is progressing very satisfactorily. She is lifted out of bed and sits in an easy-chair two or three hours each day. Her appetite is pretty good, and general strength improving. She can stand up for a short time if she leans her weight on a table, but she cannot move a foot in the least.

I am, my dear Sir,

"Yours obliged,

"E. BOOTH."

(To be continued.)

CASE OF POISONING BY THE BINOXALATE OF POTASH.

By FRANCIS C. WEBB, M.D., F.L.S.,

Physician to the Great Northern Hospital, Lecturer on Medical Jurisprudence at the Grosvenor-place School of Medicine.

INSTANCES of poisoning by the binoxalate of potash being of somewhat rare occurrence, the following brief notice of a case may perhaps be considered worthy of record.

On Monday, Oct. 3, 1859, J. B., a man aged 40, of tolerably robust appearance, presented himself in the out-patients' room of the Great Northern Hospital. He stated that on the previous Tuesday (September 27), being in perfect health, he swallowed by mistake a quantity, which he supposed to be about a quarter of a teaspoonful, of "essential salts of lemon" (binoxalate of potash) in the solid form. On taking it he experienced burning of the throat, and subsequently intense thirst, but no marked abdominal pain. Two hours afterwards he was attacked by vomiting, and about the same time by severe pain in the loins, and a feeling of great weakness in the lower extremities. On walking a short distance from his house, he found himself hardly able to reach home in consequence of "his legs failing him." Since that time he has been constantly vomiting at intervals of from ten minutes to an hour. At present he complains of lumbar

pain, swimming in the head, sensations of coldness, succeeded by burning heat in the chest and stomach, and great muscular weakness. Micturition is accompanied by a sensation of scalding. There is, however, no marked epigastric or abdominal tenderness, and no diarrhœa. The pulse beats 100 per minute; the tongue is abnormally red and irritable-looking, so much so, that it attracted my attention before I had heard the history of the case.

October 6.—Since I last saw the patient he has suffered from spasmodic contractions of the hands, from cramps in the legs, and from heaviness and pain in the head. To-day he is considerably better. The vomiting and burning in the throat and stomach have abated. He has lost the pain in the loins. The tongue and fauces, however, appear still red and irritated.

I need scarcely observe that binoxalate of potash owes its poisonous properties to the oxalic acid in its composition, and that the physiological effects produced by the two poisons appear to be identical. It has been shown by Christison and others that oxalic acid exerts a twofold action on the animal body. Besides its power as an irritant, it is capable of exercising a peculiar toxicological influence on the circulating and nervous systems. In the above case, while the vomiting, burning in the throat, and heat in the chest and stomach, are clearly attributable to its operation as an irritant, the great muscular weakness, the cramps, and the head affection, indicate the secondary action of the poison on the nervous centres. The length of time which elapsed before the occurrence of vomiting is a remarkable feature in this case. In by far the greater number of instances of poisoning by oxalic acid vomiting is a symptom which presents itself at a very early period. Exceptions doubtless have occurred, as in Mr. Hebb's case, quoted by Dr. Christison, but they are rare. The continuance of vomiting with little or no abatement for several days is also a circumstance, which, coupled with the comparatively small quantity of poison taken, is worthy of notice.

The lumbar pain and the irritation complained of in micturition, together with the absence of marked symptoms of enteric disturbance, point probably to the kidneys as the organs employed in the elimination of the poison.

M. LANQUETIN tell us that the itch insect, *sarcoptes scabiei*, has neither eyes nor heart, but has a wonderful fecundity.

THE CARMICHAEL PRIZE.—We have received a copy of a letter from Dr. Crisp, addressed to the President and Council of the Royal College of Surgeons in Ireland, directing attention to the following advertisement:—"The Council having considered the special report made by the committee appointed to examine the Essays for the Carmichael Prizes, it is resolved that no prizes be awarded to any of the competitors." Dr. Crisp says: "The substance of Mr. Carmichael's will, dated February, 1849, is as follows:—'That the interest of £3000 shall be given every four years to the two best Essays on Medical Reform, to be adjudicated by the College Council—the first prize of £200, the second of £100. That seven hundred copies of each of the essays shall be published, and sent to the Cabinet Ministers, to the Privy Council, and to all the corporate bodies of the United Kingdom,' etc. etc. But it is to the subjoined extract that I especially direct the attention of the Council:—'Should the Council not deem any of the essays worthy of a reward, they are at liberty to postpone the grant of a premium until the termination of the next four years; and at this period the interest of the capital will be doubled, the reward of the two best essays may also be doubled—£400 for the best, and £200 for the second best.' The Italics are mine. It is well-known to the Council that the prizes were not awarded in 1854, and that according to the will the grant was 'postponed' until 1859; and it was under this impression, I presume, that all who competed for the prizes laboured. It is true, that the Council were not sufficiently zealous in the cause of Medical reform to carry out Mr. Carmichael's suggestion, and on this occasion to make the prizes double. The will directs that the members of the Council are to decide upon the merits of the essays, and the delegation of this matter to a committee is not only illegal, but under any circumstances highly objectionable, and especially so where politics are concerned."

THE LONDON
PRACTICE OF MEDICINE AND SURGERY.

HOSPITAL NOTES.

REMOVAL OF AN UNDESCENDED TESTIS.

On Thursday last we witnessed an operation by Mr. Curling at the London Hospital, for the removal of an undescended testis. The circumstances under which this measure had become desirable were briefly as follows. The patient was a married man, aged 31, the father of two children. He was of cachectic and somewhat downcast aspect. His left testis occupied its usual position in the scrotum, but was not at all larger than natural, and was somewhat flabby. His right testis had never passed the inguinal ring, and could be felt as a softish swelling about the size of a small pigeon's egg. For two years past the man had been liable to attacks of pain in the part, and had also suffered much from aching in the loins and back. The gland had at times swollen considerably, especially after exertion. Mr. Curling informed us that on one or two occasions during the last year, when the man had consulted him on account of pain, there had been a decided degree of hydrocele. The fluid had, however, always been absorbed spontaneously, and paracentesis had not been necessary. The repeated attacks of pain and inconvenience had at length induced the man to wish for its removal, and Mr. Curling, after a careful examination in order to ascertain that the malposition was not complicated with hernia, had decided to accede to his request. The operation was conducted with great care. The gland after removal was found to be in an atrophied condition, and it was very questionable whether it contained any efficient secreting structure. (Mr. Curling stated subsequently that he had made a microscopic examination, and found no spermatozoa in its fluid elements.)

In some clinical remarks on this case, Mr. Curling adverted to the fact that undescended testes are frequently in a state of atrophy, and functionally useless. He had therefore felt no unwillingness to remove what had become a source of serious inconvenience. In answer to a question, as to whether in cases in which one testis only is descended, and the other remains in the inguinal canal and undeveloped, he had noticed compensatory enlargement of the descended gland, he replied, that he had not done so. He believed that the general result of his experience had been that, as in the present instance, the descended gland remained of only average size.

THE MEDIAN OPERATION FOR STONE.

On Saturday last Mr. Bowman performed Allarton's operation (modification of the median operation) for stone, on a child about three years old. The calculus was of considerable size. Unusually little blood was lost during the operation. We have learnt that the subsequent progress of the child has been extremely good, and that the wound promises to heal very rapidly. This is, we believe, one of the first operations for stone at King's College at which Mr. Allarton's method has been adopted. Mr. Bowman remarked afterwards respecting it, that he had found the introduction of the fore-finger much more difficult than he had anticipated. He thought that some better form of dilator might be devised, which would much facilitate its performance. The end of the fore-finger, even of the smallest adult hand, is very large when compared with the diameter of a child's urethra, and in the attempt to introduce it by the side of the probe there is some risk of pushing the bladder upwards instead of entering the canal. This source of difficulty has we know presented itself to several other operators, and should this method come into general employment, as it seems likely to do, some better instrument than a common probe will probably be devised. A narrow probe-pointed blunt gorget might perhaps serve the purpose. Such an instrument would also render this method feasible in certain cases of deep perineum in the adult, in which it is not easy otherwise to accomplish it.

EXCISION OF THE HEAD OF THE FEMUR.

Apropos of a case on which he had just operated, Mr. Fergusson made some interesting observations the other day on the excision of the head of the femur in cases of diseased hip-joint. He stated that his experience had led him to entertain a very favourable opinion of the general results of this operation. He was sure that spontaneous cure, after the disease had advanced to a stage of active caries, was a rare event; and when it did occur, exceedingly protracted in all its stages. He adverted to the difficulty of diagnosis as to the exact position of the head of the bone. The general belief was, he said, that dislocation on to the dorsum ilii very frequently occurred. He had found it to be very rare; and the symptoms which were usually considered to indicate it were, he held, almost always due to distortion of the pelvis, and to the limb being carried over its fellow. He had no doubt that nine surgeons out of ten would have believed the head of the bone to have been out of the socket in the case in which he had just operated; and yet, when laid bare, it proved not to be so. The next point on which he remarked was, as to whether the shaft of the bone should be sawn through at the base of the great trochanter, or whether merely the articular head ought to be removed. He much preferred the former, and always adopted it. He admitted that at first sight his plan might seem to involve the removal of a considerable portion of bone which was not in any way diseased; but he had found, by experience, that not only did the great trochanter, when left, often prove a source of inconvenience by projecting into the wound, but that the limb ultimately obtained was not so serviceable. A third objection to its retention was that its presence tended to prevent the free escape of matter during the subsequent treatment. With regard to the objection often raised to the adoption of the resection treatment in the case of the hip-joint, that it was not possible to remove the opposed acetabular surface, he held that it was wholly devoid of foundation. The truth was, that by means of the gouge a carious surface in the acetabulum might be just as easily taken away as from any other joint. In conclusion, he adverted to the importance of being very careful to get away either with the gouge or otherwise all the fragments, however small, of diseased bone.

THE LONDON AND PROVINCIAL
PRACTICE OF MEDICINE AND SURGERY.

REPORT ON
THE RESULTS OF TRACHEOTOMY.

(Continued from page 361.)

WE resume from last week's Journal the series of cases illustrative of the Results of Tracheotomy. We then cited 37 cases in which it had been required for the relief of obstruction resulting from Chronic Laryngitis, and in a Second Group 14 cases in which that operation had been performed for Scalds of the Glottis in Children. We now proceed with a Third Group comprising 14 cases of True Croup, to which will follow a Fourth, containing those in which the removal of a foreign body from the trachea was the object in view. The Croup Series will include 14 cases, with 4 recoveries and 10 deaths; that of tracheotomy for removal of foreign bodies, 13 cases, with 8 recoveries and 5 deaths. A Fifth Group in which the operation was performed on account of obstruction of the glottis caused by abscesses, tumours, malignant disease, aneurisms, etc., will conclude the series. In this last will be found nine cases, of which in one only did the patient recover.

THIRD GROUP.
TRACHEOTOMY FOR CROUP.

ST. GEORGE'S HOSPITAL.

Case 52.—F. S., aged 6, was admitted on July 26, 1857, for croup, which he had then had six days, and although he had been actively treated, the disease was not arrested. The dyspnoea was very great, the lips were livid, and the pulse

quick, weak, and fluttering. Mr. Tatum performed tracheotomy in the usual manner. During the operation there was considerable venous bleeding, and blood flowed into the trachea at each inspiration, and ultimately produced asphyxia. The tube was rapidly introduced, and artificial respiration assiduously employed. Consciousness and feeble natural respiration returned, but it was necessary to continue the artificial respiration for two hours. Pieces of false membrane and purulent matter were passed by the tube, and the patient afterwards breathed easier, and was improving until the 28th, when great dyspnoea again supervened. The tube was taken out, and a small pair of curved forceps passed some distance down the trachea. A hardened piece of false membrane and mucus an inch long, and thicker than the tracheotomy tube was removed. From this time he went on favourably, and on the 29th he began to breathe through the mouth and nostrils. He left the Hospital quite well on August 19.

Case 53.—A girl, said to be 16 years of age, but looking older, was admitted on account of croup. Death from suffocation being imminent, tracheotomy was performed by the House-Surgeon as a last resource. The thyroid body was much enlarged. Death took place almost immediately after opening the trachea, and appeared to be caused by the entrance of blood. At the autopsy, the incision was found to have passed directly through the isthmus of the thyroid. The lungs were extensively affected by a low form of pneumonia.

Case 54.—A girl, aged 6, was admitted under the care of Dr. Fuller, for croup. Suffocation having become imminent, tracheotomy was performed by Mr. Pollock. Complete relief was afforded, and the child recovered.

Cases 55 and 56.—In these, two boys, tracheotomy was performed as a last resource in croup. Both died within a few hours after the operation.

Case 57.—Under the care of Dr. Bence Jones and Mr. Prescott Hewett.—Hannah C., aged 5, was admitted with urgent symptoms of croup. The attack, which began nine days before with feverishness and hoarseness after exposure to cold, had continued to increase in severity, notwithstanding all Medical treatment. An emetic was immediately ordered, and a grain and a-half of calomel given every three hours, and an antimonial saline every four hours. Leeches were applied to the throat. In the evening, the symptoms becoming very urgent, Mr. Prescott Hewett performed tracheotomy. Mr. Hewett made a free incision immediately below the cricoid cartilage; but even here the rings of the trachea were found to be very deeply seated, owing to the neck of the child being very fat. The trachea was, however, soon laid bare, and the upper rings divided. At the moment of their division free hæmorrhage occurred, and some blood got into the trachea. This gave rise to coughing, and in one of the paroxysms a white substance was observed between the lips of the incision in the windpipe. This substance was drawn out by a pair of forceps; two masses of tough plastic lymph were thus removed. The longer of the two measured about three inches in length, but neither of them formed a complete cast of the windpipe. Some difficulty was experienced in introducing the tube, but by holding away each lip of the wound by Assalini's tenaculum it was accomplished. Hæmorrhage now ceased. She gradually recovered from the state of extreme exhaustion, and in five days the tube was removed. The wound healed, and she was discharged cured twenty-two days after the operation.

THE DREADNOUGHT HOSPITAL-SHIP.

Case 58.—Mr. F. M. Corner was called to a boy, aged 4, who had been suffering for three or four days from croup, previously a fine healthy child. The child was in the last extremity. Mr. Corner immediately performed tracheotomy. A few minutes afterwards a large solid piece of fibrine, about an inch in length, and moulded as if from one of the bronchi was forced into the opening and removed. The child then gradually came round, improving in every way; but, at the end of an hour and a-half, he suddenly, without cough or any other symptom, became suffocated and died. Nothing could be seen at the opening, and a pair of dressing forceps passed downwards failed in discovering anything. It was supposed that a large piece of false membrane had become detached, and had occluded the trachea low down. Re-action had come on freely after the operation, and the respiration, though

still a little laboured, was greatly relieved. No post-mortem was obtained.

THE METROPOLITAN FREE HOSPITAL.

Case 59.—Mr. Hutchinson.—A boy, aged 8, an out-patient, suffering from croup. Difficulty of breathing had gradually increased, and for twenty-four hours before the operation, suffocation had appeared constantly imminent. When seen for the first time by Mr. Hutchinson on the eighth day of the disease, he was too ill to permit any delay, or to allow even of his removal to the Hospital. The operation was therefore performed at his own home. Just before its completion he became deadly pale, and both the respiration and pulse quite ceased. The tube having been inserted, the operator sucked up a large quantity of thick mucus which clogged the trachea, and then continued artificial respiration. In a minute or two there were signs of returning life, and a quarter of an hour afterwards the boy was breathing tranquilly. Complete relief was afforded by the operation, and he passed a comfortable night. On the following day, about sixteen hours after the operation, great dyspnoea again suddenly occurred, and in the time that was lost in seeking for Surgical assistance the child died. The tube was found blocked by a plug of mucus as tightly as if it had been corked.

HOSPITAL FOR SICK CHILDREN.

Case 60.—A girl, aged 14 months, was admitted on May 22, with croup, which commenced the day before. The state of the child did not permit of any active remedies being employed. Tracheotomy was performed by Mr. Chippendale, the House-Surgeon, but the child died convulsed thirteen hours afterwards. On examination false membrane was seen to extend down to the third division of the bronchi.

Case 61.—Tracheotomy was performed on a child, aged 2½ years, a patient of Dr. West's, by Mr. Athol Johnson, for the relief of very urgent symptoms occurring in croup. It gave much temporary relief, but the child sank thirty hours afterwards. At the autopsy no ulceration or false membrane was found about the soft palate or tonsils. The whole interior of the larynx was occupied by false membrane, not in a coherent layer, but yet completely lining it, and so filling the interstices between the chordæ vocales as to leave very little space for the passage of air. In the trachea the membrane became a more distinct tube, and formed a coherent lining, which continued down as low as the aperture made in the operation, below which it had a less regular, and a more shaggy appearance, though still quite continuous. It was of a dirty greyish colour, and extended, though with diminishing consistence, into the tertiary bronchi on the left side, though scarcely into the secondary in the right. On each side it lost much in cohesion the further it was traced, until it merely resembled thick pus. The bronchial and tracheal mucous membranes were of a vivid red colour, but the smallest bronchi were unaffected; and the lungs themselves, though congested, were for the most part emphysematous. There was no pneumonia, and no pleurisy, but a few patches of pulmonary collapse were noticed, especially in the left lung.

Case 62.—A boy, aged 3 years, was admitted on March 29 with croup. The symptoms were said to have commenced three days before. Tracheotomy was performed by Mr. Walter Chippendale, House-Surgeon, on the 31st. The case progressed favourably up to the thirteenth day, when the child became suddenly depressed, and sank in a few hours. The tube had been finally removed on the tenth day. On post-mortem examination, ulceration was found within the trachea from the second ring to within an inch of its bifurcation, measuring an inch and a-half in length. The interior of the larynx was coated with an imperfect and very thin layer of softened and easily-detached false membrane.

KING'S COLLEGE HOSPITAL.

Case 63.—A boy, aged 10, was admitted, under the care of Dr. Todd, having suffered from sore-throat for about a week. He had great difficulty of breathing at the time of admission. There was no œdema of the epiglottis, nor any abnormal appearance in the pharynx or upper part of the larynx. The cough was croupy, and the breathing stridulous. The dyspnoea, urgent from the first, became more and more so every hour, and twenty-four hours after admission became so extreme as to threaten immediate suffocation. Mr. Atkinson,

the House-Surgeon, therefore, performed tracheotomy. Great relief was obtained, but it was only temporary, and the child died five hours later. At the post-mortem examination, a continuous coating of false membrane was found lining the trachea and bronchi, extending even into the smallest ramifications of the latter.

THE MIDDLESEX HOSPITAL.

Case 64.—A child, aged 3, was admitted for croup. The symptoms had lasted twenty-four hours, when they became so urgent that tracheotomy was performed by Mr. Moore. Death, from the original disease, followed in nine hours.

ST. MARY'S HOSPITAL.

Case 65.—An infant, aged 13 months, was admitted, under the care of Mr. Ure, for acute croup. Tracheotomy was performed, but the child only survived the operation a few hours.

ADDENBROOKE'S HOSPITAL, CAMBRIDGE.

Case 66.—A boy, aged 4, was admitted with a view to the performance of tracheotomy, on account of urgent symptoms arising in the course of laryngitis. The dyspnoea gradually increasing, had become urgent and alarming. Chloroform was administered, but produced no mitigation of the symptoms. After the canula had been introduced, it was necessary for a short time to practise artificial respiration. As soon as the breathing was well re-established, all dyspnoea passed off, and the boy afterwards recovered without a drawback. The tube was removed on the tenth day, and the wound soundly healed soon after.

FOURTH GROUP.

TRACHEOTOMY FOR FOREIGN BODIES IN THE AIR-PASSAGES.

ST. MARY'S HOSPITAL.

Case 67.—A child, aged 4, was admitted nearly moribund, with the statement that he had choked from swallowing a crab's claw. Mr. Watkins, the House-Surgeon, at once performed tracheotomy with immediate relief. The foreign body was not expelled, nor was it deemed wise to make any search for it. On the following day Mr. Lane examined the trachea, but was not successful in finding the offending body. The child died on the fourth day. At the autopsy the end of a crab's claw was found in the trachea just above the wound. The mucous membrane of the trachea was congested and thickened, and there were evidences of extensive pleuropneumonia.

Case 68.—A girl, aged 2, was admitted under the following circumstances. She had been sleeping in a cart upon some bags of sawdust, when one of them became untied, and its contents fell over her, and some passed into her mouth. She was brought to the Hospital twenty minutes afterwards, almost dead from suffocation. The trachea was immediately opened, but after three or four feeble attempts at respiration she died. At the autopsy a large plug of sawdust was found in the trachea at its bifurcation, almost completely filling it up. The large bronchi were also nearly filled by it.

Case 69.—A boy, aged 8, was admitted, under the care of Mr. Lane, on the third day, after having (according to his own account) swallowed a piece of nutshell. For two days there had been no symptoms of impediment to breathing or other uneasiness. The symptoms on admission were very slight, air entered both lungs freely, and no particular part of the trachea was referred to as the seat of tenderness or pain. On the sixth day symptoms of suffocation had become so imminent that it was determined to open the trachea. Before, however, the operation could be completed, the child had expired. Artificial respiration and galvanism were had recourse to, but proved of no avail. At the autopsy, a small irregularly-shaped portion of nutshell was found lodged in the crico-thyroid membrane, just above the opening made into the trachea. It is right to add that chloroform had been given during the operation, but the patient was never fully under its influence.

ST. BARTHOLOMEW'S HOSPITAL.

Case 70.—A healthy boy, aged 5, was admitted with the statement that he had swallowed a nut. He was gasping for breath and quite livid. Mr. Morris, the House-Surgeon, at once introduced his finger into the pharynx, and in so doing

felt it displace some small substance at the back of the tongue. The urgent symptoms immediately subsided, and the child regained his natural breathing. During the day and the following night, his respiration was in no way impeded; but about nine o'clock the next morning, whilst at breakfast, he was suddenly seized with violent dyspnoea. The House-Surgeon was summoned, and found him lying on his back, livid, quite insensible, and almost pulseless. Nothing could be felt in the throat. Tracheotomy was at once performed, and immediate and complete relief followed. Soon after the operation it was observed that the chest did not expand on the left side during inspiration, and on auscultation it was found that no air entered the lung. Percussion over the left side gave a resonant note. The tracheal tube was now removed, a ligature being placed in each lip of the wound to secure its patency. During the day, the child was kept in a warm atmosphere, and appeared tolerably comfortable. About fifteen hours after the operation, he was suddenly seized with a violent paroxysm of coughing, during which the foreign body was shot out through the opening in the trachea. It proved to be the stone of a damson plum. Shortly after its expulsion the breathing became much less laboured and vesicular respiration was now audible over the left lung; a slight bronchitic attack followed, which subsided under treatment by antimonials. The child made an excellent recovery.

Case 71.—C. C., aged 11 years, was admitted under the care of Mr. Paget. The history previous to admission was:—that a fortnight ago, while eating a mussel-plum, the stone had, as she said, "slipped down the throat" during a fit of crying. She was taken to Mr. Langdon, of Chobham, suffering from urgent symptoms. He performed tracheotomy in the usual manner. She coughed violently; and various other means were tried, but the stone still remained. The wound was allowed to heal, and in about a week she became easy and apparently well. Her cough and other urgent symptoms however returned, and she was sent to St. Bartholomew's Hospital. Mr. Paget operated under chloroform, making an incision in the trachea as low as possible. He could then easily feel the stone with his finger. Many attempts were made by forceps of various construction to seize it, but they failed. The wound was again enlarged upwards, in order that by inverting the patient the stone might fall out, but almost immediately it was ejected by coughing. The edges of the stone were very sharp. The patient recovered.

GUY'S HOSPITAL.

Case 72.—An infant, aged 11 months, was admitted on account of stridulous breathing, which was stated to have come on immediately before admission quite suddenly, and without known cause. The difficulty in breathing was very great, and suffocation seemed imminent. Tracheotomy was performed about four hours after the commencement of the symptoms. Much loss of blood attended the operation, and the infant was all but dead. No foreign body was found, and the tracheal tube was not introduced, in the hope that if anything were impacted it might be coughed up through the wound. No relief was obtained, and death occurred about three hours afterwards. At the autopsy a piece of bone about the size of a fourpenny bit, was found firmly impacted in the rima glottidis. It was afterwards ascertained that just before the difficulty of breathing came on, the mother had been feeding the child with mutton broth.

Case 73.—J. M., aged 5, was admitted on account of great difficulty of breathing, consequent on swallowing a plum-stone. The stone had been ground so as to make a whistle, and with this the boy was in the act of whistling; when a blow from his mother on his back caused him to make a spasmodic inspiration, during which it was swallowed. Immediately afterwards he was seized with great difficulty of breathing, and inability to cough. In the absence of Mr. Callaway, Mr. Cooper Foster was called to him. He was then lying on the right side, breathing laboriously, and making very ineffectual attempts to cough. The countenance was livid, the extremities cold, and the pulse very feeble. Over the chest was a remarkable condition of puffiness, attended by cracking on pressure, as if from emphysema. Any attempts at movement brought on great dyspnoea, but while lying quiet the breathing was not attended by any gasping effort. Mr. Cooper Foster at once performed tracheotomy. The third and fourth rings of the trachea were divided, and but little hæmorrhage occurred. Almost immediately after the opening had

been made, a coughing effort threw the stone out into the wound. All the symptoms were immediately relieved. The wound was left open, simply covered by lint. Excepting a slight attack of bronchitis, for which no special treatment was required, the boy made an uninterrupted recovery. On the fourteenth day after operation, a copious eruption of herpes about the mouth showed itself; but it disappeared spontaneously, and did not appear from the other symptoms to have depended on any pneumonic inflammation.

Case 74.—A boy, aged 6, was admitted, under the care of Mr. Cooper Foster, having, it was believed, swallowed a cherry-stone five days before. His mother stated, that while playing, with a cherry-stone in his mouth, he had suddenly appeared to be choked, and fallen down. Soon after the accident he became better, and could breathe easily, but repeated paroxysms of difficulty of breathing occurred in the evening. He said he could feel something moving up and down his throat. He always reclined on his right side, but preferred to sleep sitting up in bed. Excepting during the occasional attacks of dyspnoea, there had been no symptoms whatever, and in the intervals he had been perfectly well. Mr. Foster examined the chest carefully, and found equal respiration on both sides. The boy stated positively that he felt something move up and down, and no doubt was felt as to the stone being in the trachea. A paroxysm occurred in the evening, and just as it was passing off tracheotomy was performed. Chloroform was not given. As soon as the trachea was opened a coughing fit occurred, and the stone was ejected into the wound. The wound was afterwards allowed to close, and, except a slight attack of erysipelas, everything did well. The wound healed, and he soon afterwards left the Hospital.

Case 75.—A healthy-looking girl, aged 8, was admitted on May 3, 1854, under the care of Mr. Hilton. Three hours previously she had swallowed a large oval glass-bead, which had passed into the trachea. The operation for the removal of the foreign body was performed two days later. During the interval, the symptoms indicating its presence in the air-passages had been decided, and although at no time very severe, were gradually increasing. In the operation the trachea was freely opened by a valve-like flap. The opening was held widely patent, and during a rather violent coughing effort the bead, enveloped in mucus, was ejected. The child recovered well, and the wound was soundly healed at the end of three weeks.

KING'S COLLEGE HOSPITAL.

Case 76.—A boy, aged 3, was admitted with the account that he had swallowed a small, black, round shoe-button, having a piece of string attached. He was brought to the Hospital within ten minutes of the accident, and was then on the point of death from suffocation, being cold, pulseless, and blue in the face. The button could not be found by examination through the mouth, and Mr. Tutin, the House-Surgeon, accordingly at once performed tracheotomy. The child soon revived after the opening had been made in the trachea. The button could not be found, and up to the thirteenth day had not been discovered, although several examinations had been made with that object. Severe bronchial inflammation followed, requiring him to be constantly watched for several days and nights, but he recovered well from this. Frequent attempts were made to do without the tube, but symptoms of suffocation always began to show themselves shortly after its removal. After some weeks the thread came away through the opening in the trachea. It was supposed that the button had been coughed up and swallowed. About three months afterwards he had a second attack of bronchitis, from which he again recovered. Mr. Partridge enlarged the tracheal opening, and made a searching examination, but found nothing.

THE LONDON HOSPITAL.

Case 77.—A male child, aged 16 months, was admitted one evening with the statement, that while at breakfast in the morning, he had swallowed a piece of fish, which immediately caused symptoms of choking. The child's mother at the time passed her finger into the throat, and by beating the child on the back succeeded in obtaining some relief. A Surgeon to whom the child was taken, ordered an emetic, which procured the expulsion of a piece of fish-bone, and almost complete mitigation of the symptoms. During the middle of the

day the child played about, and at noon ate a hearty dinner. Towards evening, however, cough came on, and symptoms of obstruction in the larynx rapidly developed themselves. When admitted, at seven p.m., he was exhausted and much oppressed, and the respiration was crowing. An emetic was employed, and afterwards a warm bath. No relief being afforded, Mr. Corner, the House-Surgeon, performed tracheotomy. No blood was lost, and as soon as the tube was introduced, relief to the more urgent symptoms was obtained. An examination by means of a probe was made, both of the larynx above and the trachea below, but no foreign body could be detected. The child rallied, and about midnight seemed in a favourable condition. A sinapism was ordered to the chest on account of the presence of bronchitic rales. At half-past three in the morning Mr. Corner was summoned, and on reaching the child found it dead. No post-mortem was permitted, but by examination through the wound two pieces of fish-bone were found firmly fixed between the vocal cords.

ADDENBROOKE'S HOSPITAL, CAMBRIDGE.

Case 78.—A boy, aged 3, was admitted, under the care of Dr. Humphry. He was suffering from much difficulty of breathing, supposed to arise from his having got "a haw into his windpipe." Four hours after admission alarming dyspnoea came on, and, on applying the stethoscope over the trachea, a clicking sound was heard. Tracheotomy was now resorted to, but before the trachea could be opened the child was to all appearance dead, both the pulse and respiration having ceased. The trachea was quickly opened, and the tube introduced, through which artificial respiration was kept up for some minutes. The child having rallied, the canula was removed, and the wound in the trachea being held open by blunt hooks, the haw was expelled with force during a powerful expiration. As he could not breathe comfortably without it, the tube was reintroduced afterwards, and allowed to remain three days. Thirteen days afterwards the wound had healed, and the child being quite well, was allowed to leave the Hospital.

THE QUEEN'S HOSPITAL, BIRMINGHAM.

Case 79.—A boy, aged 2½, was admitted in a state of asphyxia. He was said to have swallowed a plum-stone a quarter of an hour previously. Tracheotomy was performed immediately, and a bougie was passed through the wound upwards into the pharynx. No stone was found, but the child's breathing was relieved by the operation. Liability to spasmodic cough continued for a fortnight afterwards, and then gradually ceased. The wound healed, and the child regained its health, careful stethoscopic examination failing to detect anything wrong in the chest excepting, perhaps, a very slight impairment of respiration in the lower part of the right lung. The motions had been carefully watched, but the stone was not found.

FIFTH GROUP.

TRACHEOTOMY FOR CAUSES NOT INCLUDED IN THE FOREGOING REPORTS.

Case 80.—St. Bartholomew's Hospital.—A man, aged 27, was admitted for acute inflammation of the tissues of the neck. Dyspnoea having become very urgent, the trachea was opened, under desperate circumstances by Mr. Stretton, House-Surgeon. No relief was afforded, and the man died almost immediately afterwards.

Case 81.—St. Bartholomew's Hospital.—Mr. Humphry, House-Surgeon, performed tracheotomy on a young woman in whom suffocation appeared imminent from the pressure of a tumour of obscure nature in the front of the neck. Much temporary relief followed the operation, but the patient lived only eighteen hours afterwards. At the autopsy, a mass of medullary cancer was found extending downwards, and almost encircling the trachea.

Case 82.—St. Thomas's Hospital.—A man, under the care of Mr. Mackmurdo. Laryngotomy was performed to relieve dyspnoea, occasioned by the pressure of a large bronchocele. The patient died twelve hours after the operation, and at the post-mortem the trachea was found compressed laterally to a mere chink.

Case 83.—St. Mary's Hospital.—A woman, aged 33, was admitted, suffering under stricture of the œsophagus and much dysphagia. Difficulty of breathing from pressure

on the larynx at length set in, and having become very distressing, tracheotomy was performed. The operation afforded temporary relief, but death subsequently took place.

Case 84.—The London Hospital.—A boy, aged 14, was admitted, under the care of Mr. Luke, in consequence of great dyspnoea following his having been suspended on a crane-hook by his neckerchief. The neck had been severely crushed. Tracheotomy was performed, and with immediate relief, but death took place suddenly twenty-eight hours afterwards with all the symptoms of asphyxia. The autopsy showed that the cartilages of the larynx had been completely broken in.

Case 85.—Addenbrooke's Hospital.—A woman, aged 57, under care on account of idiopathic tetanus. The trachea was opened in order to relieve the alarming symptoms caused by spasm of the glottis. For a week previously the spasm had especially affected the muscles of the glottis. Much relief was afforded by the operation, but the disease continued, and death took place two days afterwards.

Case 86.—The Liverpool Royal Infirmary.—A labourer, aged 20, under the care of Mr. Long, having had his neck crushed between the buffers of two railway carriages. The trachea had been ruptured, and emphysema of the neck and numbness of the arms, etc., followed. In the course of a few days dyspnoea had become so urgent as to threaten life. An incision having been made over the trachea, it was found to be ruptured, and its rings at one part separated to the distance of an inch. A tube was inserted, and owing to respiration having entirely failed, it was requisite to suck up by the mouth a quantity of mucus and blood, and to re-inflate the lungs. This done, the man began to breathe again, and subsequently rallied perfectly. He left the Infirmary, with the wound well healed.

Case 87.—A boy, aged 3, was admitted under the care of Mr. Callaway. The operation of tracheotomy was performed, but the circumstances were hopeless, and death followed immediately afterwards. The disease proved to be a post-pharyngeal abscess connected with the spine, which was believed to have pressed forwards upon the trachea.

Case 88.—A man, aged 50, was admitted under the care of Mr. Callaway, for malignant disease of the larynx and trachea of two months' duration. Repeated attacks of spasmodic dyspnoea had threatened suffocation, and during one of these tracheotomy was performed. The relief afforded by the operation was complete, but death from lobular pneumonia followed forty-eight hours afterwards. The tube had been retained the whole time. The autopsy showed evidence of lobular pneumonia and pleurisy. About four inches below where the operation had been performed was an opening communicating with the œsophagus.

NOTES AND QUERIES.

He that questioneth much shall learn much.—*Bacon.*

No. 364.—PATIENTS AND THEIR PHYSIC.

An amusing anecdote is related in the *Hore Subscivæ* of a Chawbacon who literally obeyed his doctor's orders, to "take that" (his prescription). At the end of fourteen days he returned perfectly well, in great admiration at the efficacy of the remedy. It has reminded me of a somewhat similar occurrence, which happened while I was attending the Edinburgh Hospital Practice, some twenty years ago. The apothecary by accident set up to a patient a pill-box containing some half-dozen grain weights, everyone of which the patient took according to order. When questioned as to how he got them down, he answered, that "they were unco hard, but that he had rolled them up and so got them down pleasantly enough!"

I am, &c.

No. 365.—CIVILISED POISONS.

Dr. Christison will not admit that savage skill beats civilised ingenuity in the manufacture of poisons. "The urari of the Essequibo, the upo or upas of Java and Borneo, the Uritsan of China, are potent poisons, no doubt. But in potency they will never stand comparison with several of the pure principles which the chemistry of civilised nations has detached from poisonous vegetables. Any tribe of men, compelled by

circumstances to obtain their food by shooting game with poisoned arrows, would profit greatly could they substitute digitaline, aconitina, conia, strychnia, and other pure principles of plants, for their own cruder extractiform poisons. These principles, indeed, might be so used as to deal destruction to the very largest animals on the face of the globe."—*Edinburgh Monthly.*

No. 366.—CURE FOR ERYSIPELAS.

"In parts of County Carlow the blood drawn from a black cat's ear, and rubbed upon the part affected, is esteemed a certain cure for St. Anthony's fire."—*Notes and Queries.*

No. 367.—THE BILL FOR THE EMBALMMENT OF THE BODY OF HER MAJESTY QUEEN MARY, BY DR. HARE, HER MAJESTY'S APOTHECARY.

"For perfumed sparadrape, to make cerecloth to wrap the body in, and to line the coffin; for rich gummies and spices to stuff the body; for compound drying powders perfumed to lay in the coffin under the body, and to fill up the urne (where the heart or viscera were enclosed); for Indian balsam, rectified spirits of wine tintured with gummies and spices, and a stronge aromatized lixivium to wash the body with; for rich damask powder to fill the coffin, and for all other materials for embalming the body of the High and Mighty Princess, Mary, Queen of England, Scotland, France, and Ireland, etc. As also for the spices and damask powders to be putt between the two coffines with the perfumes for the cambers (chambers) altogether 200lbs. 00s. 00d. Jo. HUTTON."—*Strickland's Queens.*

No. 368.—DOCTORS DIFFER.

"Her disorder was, however, supposed to be only the measles, some two or three days afterwards, and great hopes were entertained of her recovery; but on the identity of her malady her Physicians could not agree, Dr. Radcliffe declaring that she would have the measles, and Dr. Millington the small-pox. Burnet affirms that the fatal turn of her malady was, owing to Dr. Radcliffe, in remarkable words, which are not to be found in his printed history, as follows:—'I will not enter into another province, nor go out of my own profession,' says Burnet's MS., 'and so will say no more of the Physician's part, but that it was universally condemned, so that the Queen's death was imputed to the unskilfulness and wilfulness of Dr. Radcliffe, an impious and vicious man, who hated the Queen much, but virtue and religion more. He was a professed Jacobite, and was by many thought a very bad Physician, but others cried him up to the highest degree imaginable.'"—*Strickland's Queens.*

No. 369.—SUPERSTITIOUS PREMONITORS OF DEATH.

A wild bee, that is a humble bee, entering a room, gives warning of death. So does the crowing of a hen, so does the squeaking of a mouse behind the bed of a sick person. If the door of a hearse be closed before the mourners are all in the coaches, there will be another death in the family. If a cow breaks into your garden there will be death in your house within six months. The gentleman who sends note of this superstition adds the singular fact that it was made known to him by the breaking of three cows into his own garden, when an old house-servant grieved that there would be three deaths in the family within six months—and there were. The third was that of a son-in-law, into whose garden, also, a cow broke some weeks before he died. Nobody can die on a bed in which there are any pigeon and game feathers. This is a wide-spread belief, easily confirmed to the ignorant by proofs like the following, which were adduced by a Sussex labourer against a septic—"Look at poor Muster S—, how hard he were a dying; poor soul, he could not die any way, till neighbour Puttick found out how it wer. 'Muster S—,' says he, 'ye be lying on geame feathers, mon, surely;' and so he wer. So we took'n out o' bed and laid'n on the floore, and he pretty soon died then." The last thing a man longs to eat seems to be pigeon. A very respectable farmer's wife being applied to for some pigeons, which a sick man fancied he could eat, said, "Ah! poor fellow, is he so far gone? A pigeon is generally almost the last thing they want. I have supplied many a one for the like purpose." If a pigeon is seen sitting on a tree, or enters a house, or from being wild grows tame, that is a sign of death. If any bird flies into a room and out again by an open window, that is a sign of death among the inmates of the house.

No. 370.—HARVEY'S AUTOGRAPH.

"The great discoverer of the circulation of the blood must have written surely a great deal; yet the only specimen of his handwriting said to exist—his name in an album—was sold lately for twenty pounds."—*London News*.

No. 371.—A NATURALIST.

"Swammerdam was born at Amsterdam in 1637, and died in 1680 from the effects of an hypochondriachal affection aggravated by excessive devotion to study. In one of his fits of melancholy he threw a great part of his manuscript into the fire, imagining that it was an offence against God to attempt to unravel the anatomical structure of insects! On another occasion he sold for a paltry sum a mass of his manuscripts, which were recovered at a great cost by Boerrhave, and published under the title of *Biblia Naturæ*. Swammerdam appears to have been one of the first who practised the art of anatomical injections; but his chief celebrity rests upon his anatomical researches on insects."—*Quatrefages*.

No. 372.—DR. RADCLIFFE ON VENESECTION.

"The boy (the Duke of Gloucester) reviewed his little regiment, exulting in the discharge of cannon and crackers, and presided over a grand banquet. He was very much heated and fatigued, and probably had been induced to trench on his natural abstemiousness. The next day he complained of sickness, headache, and a sore-throat; towards night he became delirious. The family Physician of the Princess sought to relieve him by bleeding, but this operation did not do him any good. There was a general outcry and lamentation in the young duke's household that he would be lost, because Dr. Radcliffe was not in attendance on him, owing to the affront the Princess Anne had taken. Dr. Radcliffe was, however, sent for by express, and though unwilling, he was prevailed on to come. When he arrived at Windsor Castle and saw his poor little patient, he declared the malady to be the scarlet fever. He demanded who had bled him. The Physician in attendance owned the duke had been bled by his order. 'Then,' said Radcliffe, 'you have destroyed him, and you may finish him, for I will not prescribe.' The event justified the prediction of the most skilful Physician of the age; but he was as much abused by the people, who clung to the last scion of their native princes, as if he had wilfully refused to save the child."—*Strickland's Queens*.

No. 373.—A PLAIN-SPOKEN DOCTOR AND AN EYE DOCTOR.

King William had, from his childhood, suffered from bad health. In the course of three or four years after the death of Queen Mary, his frame was sinking under a complication of diseases. During one of the attendances by Dr. Radcliffe, His Majesty's Physician, the King asked him what he thought of a complaint which had attacked his legs. "That I would not have your Majesty's two legs for your three kingdoms," was the startling rejoinder. King William thenceforth banished Radcliffe from court; but as the great Physician was a Jacobite, this was no punishment. The Princess Anne, finding that her child about this time suffered with inflammation in the eyes, became alarmed lest he should be as much subject to this distressing complaint as she was, and her sister, Queen Mary. The idea grieved her so much, that she went in person to Bloomsbury, where lived old Dr. Richley, who was, in the language of our narrator, "famous for bad eyes." It is to be feared that he was a quack doctor. He gave the princess a little bottle, and directed the liquid therein to be applied to the eyelids with a camel's hair-brush. At that time the Duke of Gloucester's eyes were almost closed, so that he could not bear the light. He had been prescribed diet-drink which he refused to take, until his father, Prince George of Denmark, had enforced obedience by another castigation, but, when swallowed, the "diet-drink" did no good. The Princess Anne, who had been harassed and vexed by these contentions, applied the nostrum of the oculist she had been to seek, which effected an immediate cure, upon which her Royal Highness sent the doctor a purse with fifty guineas in token of gratitude.

Two hundred and fifty papers have been received by the Council of the Social Science Association, for the purpose of being read at Bradford.

Medical Times & Gazette.

SATURDAY, OCTOBER 15.

THE BRITISH MEDICAL JOURNAL ASSOCIATION.

WE are by no means anxious to interfere with the internal economy of the British Medical Association; but when it is urged so perseveringly that the members of this Association are supplied for a guinea a year with as good a Journal as our subscribers can obtain for thirty shillings, we must be excused if we not only stand on the defensive, and show that this boast is unfounded even so far as the mere quantity of paper and print is concerned, but if we go a little further, and point out that the Association is indebted to us for some considerable share of the material paid for by the proprietors of this Journal; and we may fairly go on to comment on what may be called the *Political* aspect of a question which, interesting, as it does, some two thousand members of our Profession, has a most important influence on the future position of Medicine in this country.

A few months ago (March 26, 1859) it became our duty to compare the British and the American Medical Associations, when reviewing the eleventh volume of the Transactions of the latter body. In that volume, after a report of the eleventh annual meeting of the Association, of the Committee of Publication, of the Treasurer, and of the address of the President, we have the following series of reports by members of the Association, or by Committees:—

1. On the Medical Topography and Epidemic Diseases of Kentucky.
2. On the Topography and Epidemic Diseases of New Jersey.
3. Committee Report on the Epidemics of Ohio.
4. " " Medical Literature.
5. " " Medical Education.
6. On Spontaneous Umbilical Hæmorrhage in the Newly-born.
7. On Marriages of Consanguinity.
8. On the Functions of the Cerebellum.
9. On the Treatment of each Variety of Cataract.
10. On the Medical Jurisprudence of Insanity.
11. On the Law of Registration of Births, Marriages, and Deaths.
12. On the Nervous System in Febrile Diseases.
13. On Moral Insanity in its relation to Medical Jurisprudence.
14. On Stomatitis Materna.
15. On the true Position and value of Operative Surgery.

Then follow the two prize essays of the year—one on the Clinical Study of the Heart Sounds in Health and Disease; and the second on the Ophthalmoscope. The volume is concluded by the Plan of Organisation and the Code of Ethics of the Association, with a list of the officers and members. We should add, that it contains several coloured engravings, besides maps and woodcuts, and that some of the above reports are masterpieces.

Now, the American Association, like the British, has about two thousand members. Each member of the American

Association pays twelve shillings a-year as his subscription. The subscription to the "British" is a guinea. The one Association offers prizes, makes grants for the expenses of original inquiries, appoints working committees to investigate important questions, and supplies its members with the result of all this work in an annual volume of Transactions, which is a real acquisition to any Medical library. The Association has published carefully-prepared reports of the various epidemics and diseases which have prevailed during the past ten years, and of the vital statistics of the principal cities, illustrating them by charts, maps, diagrams, tables, and plates. "Every state and territory, every large city and sick community, with scarcely an exception, has had its hygienic condition explored by this body; and dysentery and cholera, typhoid and yellow fevers, have specially claimed attention." The Association has been thanked by the Senate for its prevention of the importation of worthless or adulterated drugs; it has introduced a uniform system of registration of births, marriages, and deaths to the different States; it has framed regulations for the sanitary government of emigrant vessels; it has investigated the indigenous Medical flora of the Union; it has elevated the standard of Medical education in the States, having reformed the schools solely by its moral power; lastly, it has blended the Medical body into a "common harmonious fraternity," and has thus acquired for the Profession a power of extended usefulness, and has elevated the position of our order. What a contrast is offered by the British Medical Association! As a scientific body, encouraging research and rewarding merit, it is absolutely unheard of; as a medico-political power it is destitute of influence, because destitute of funds. The clauses it attempted to introduce into the Medical Act were as complete failures as the Act it unsuccessfully attempted to induce the Government to accept. It has done nothing for vaccination, nothing to check the sale of poisons. The various Public Health Acts have been passed without reference to it. It has done nothing of importance in Poor-Law Medical Reform. It has done nothing to check irregular practice, or promulgate a code of Medical ethics. It is a mere joint-stock company, vainly attempting to compete with this and the other weekly Medical journal of the metropolis. Its sole vitality is in its annual social gatherings. Let them be kept up; but in all other respects, if the Association is to become a useful, influential, and respected body, let it return to its original constitution, encourage experimental investigation, promote Medical science, assume some authority in the sanitary affairs of the nation, put away discreditable trading competition, and outshine, instead of being shamed by, its younger and more vigorous brother in the West.

Feelings such as those to which we have above given expression have long been brooding in the minds of many true friends of the British Association. Stormy discussions have taken place at the annual meetings, introducing an element of discord into what should be harmonious friendly gatherings. At length the question has been seriously brought forward at a Branch meeting:—

"At the general meeting of the East York and North Lincoln Branch, the following resolution was agreed to:—

"That in the opinion of this Branch the funds of the Association are injudiciously expended upon a weekly Journal, which is the sole cause of the present financial difficulty, and we believe that the existing debt would be most easily liquidated by a discontinuance of the weekly publication, by which also the number and usefulness of our Society might be largely extended, and its general interests greatly furthered."

The Editor of the Journal very properly says,—

"No question could be brought before the different Branches of the Association more legitimately than the one referred to in the foregoing resolution."

And it is one which will doubtless be discussed at all the Branches in succession. The resolution just quoted was brought forward in a most able manner by Mr. Dix, of Hull, who showed that, "with the exception of the meagre salary of the General Secretary, the whole amount of the subscriptions of our Associates is expended on the Journal," and asked,—

"What is this Journal, that we should expend so much thereon; which swallows up all our subscriptions, the whole of which are inadequate to its maintenance; and for the sake of which we have been for years past, and still remain, considerably in debt?"

Continuing his argument, and urging that the Journal "so far from being of advantage to us, is an incubus and a stumbling-block in our path," he insisted that the cost of the Journal led to the necessity for the annual subscription of a guinea and to the debt; and that the amount of the subscription prevented very many eligible members from joining the Association. He then went on to ask, "What is the actual value, pecuniary or otherwise, of this our much-lauded periodical?" Arguing that those gentlemen who see this Journal or the *Lancet*, do not want the Journal of the Association; and that those who trust to their own Journal alone, "are leaning on a bruised reed, that they are gradually retrograding and falling into the wake of science," he entered into a detailed description of the contents of corresponding numbers of the three journals; but he did not add, as he might have done, that the reports of the discussions at the Medico-Chirurgical Society, and those of the meetings of the Pathological Society, are supplied by paid reporters to the two proprietary Journals, and are copied the following week, or perhaps *weeks* after, without acknowledgment, by the organ of a large body of honourable men.

After arguing that the Journal is inferior to the other two weeklies, he asks whether this Association Journal is—

"needed at all? Are not the other periodicals sufficient for all useful purposes? I don't deny that the Journal often furnishes us with good papers, but these we should get all the same if our Journal were blotted from existence. Indeed, I fear a useful paper often falls still-born, because it is published in the Journal, and my advice to men about to publish would be this: if you want to be read, don't send your paper to the Association Journal, for it is a well-known fact that its readers, beyond the circle of members, are very few. It is to be feared that some even of our members don't duly study their Journal. How few care to preserve it? How few bind it and give it a place on their shelves? To a reading man the superabundance of periodical literature is a nuisance, because it is absolutely necessary that he should see all that is written. Thus, so long as there are three weekly Medical papers, three we must read more or less. Viewed in this light, is not our Journal a supernumerary and a nuisance?"

"Supposing, from an increase of subscribers, our Journal were so improved as to become the very best of all weekly Medical periodicals, what good or useful purpose would it serve? We might increase the number of those to whom I have already alluded, who take the Journal and no other periodical, many of whom, in default of our Journal, would probably contribute to the support of the other established publications, and so we might inflict considerable damage on these publications (some we already do them, no doubt). We might become formidable competitors for public favour; we might even defeat the laudable and hitherto successful results of private enterprise. Is this, I ask, the mission of our Association? Is this the best use we could make of our funds?"

The practical summary of Mr. Dix was as follows:—

"I am but arguing against the Journal in its present expensive shape. A periodical of some sort we no doubt need, but it should be the organ of the Association alone, a cheap and simple record of our own transactions and proceedings. These are matters of detail, and subjects for future consideration; but I must confess that I have a strong feeling in favour of lowering the subscription, for I have already shown that all the present advantages of the Associa-

tion, except the Journal, are costless, and I have given reasons for believing that if the cost of admission were lessened, the result would be that scarcely any eligible member of the Profession would stand aloof from our Society; we might then become what I most earnestly long for, and hope to live to see, a Universal Medical Association, including within our ranks every respectable Medical man."

The report of this able speech in the *British Medical Journal* of last week is accompanied by a leading article, and by several notes of comment by the Editor. Upon one of these we feel it necessary to say a few words. The Editor says:—

"By all means let a man read a dozen periodicals if he pleases. But suppose he requires one only—and there are many with that moderate wish—does Mr. Dix mean to say that he is to pay £1 10s. a-year for that which he can procure for a guinea?"

Now, do the members of the Association get for their guinea thirty shillings' worth of paper and print, as measured by the standard of this Journal? We say nothing as to the scientific and practical value or novelty of the contents. That we may safely leave to Mr. Dix; but the pecuniary question is one of simple arithmetic. Now, last year the *British Medical Journal* contained 1082 pages, and 12 woodcuts; the *Medical Times and Gazette* contained 1351 pages, 99 woodcuts, and 11 lithographic illustrations. Had we compared the Journals this year, the illustrations to Dr. Simpson's admirable Lectures would have shown a balance still larger in our favour. As it is, we show 11 lithographs, 87 woodcuts, and 296 pages of letter-press over and above the guinea Journal. Can it be said, then, that if the British Medical Association has degenerated into a trading Society for the printing of a weekly Journal by the aid of advertisers, and has been brought to the verge of bankruptcy by so exhausting a drain on its income, it has attained the single merit of success? Or must it be confessed that this application of the principles of association is false, and that the attempt to compete with legitimate enterprise is a failure?

These are questions which will be raised and discussed by the Branches of the Association. We can only suggest that if the Association is to exist for the Journal, not the Journal for the Association, that the future title of the body should be "THE BRITISH MEDICAL JOURNAL ASSOCIATION."

THE WEEK.

THE following remarks, taken from a late monthly report on the Health of Marylebone, by Dr. Thomson, are worthy of all attention. It is only too often that the most successful efforts of the Surgeon are neutralised by some defective Hospital arrangement.

"Some facts, which have been communicated to me by Dr. Corfe, the Resident Medical Officer of the Middlesex Hospital, exhibit in a strong point of view the importance of tracing to their origin all odours of a disagreeable character. Three cases of erysipelas occurred in succession on the first floor of the west wing of the Hospital: they assumed a virulent form, but did not prove fatal. The attention of Dr. Corfe was first roused to a suspicion that the disease originated from a local cause by one of the sisters complaining of a very offensive smell occasionally in the ward. Observing that the unpleasant odour came from the west side of the ward, and that the post mortem examination room was contiguous to this portion of the building, it was ascertained that as the skylight was open any effluvia could readily pass by this opening into the ward; the waste pipe of the room was found to be untrapped, and on examining the drain with which it communicated, a small cesspool was discovered full of putrid matter, and the drain was found to be blocked up. The cesspool was filled up, the drain cleansed and trapped, and for twelve months not a single case of erysipelas has occurred in the ward. Such hints as these are most valuable in connexion with our public institutions, and prove to us that

odours of a noxious character, although considered by many as unworthy of notice, have their proper use in a well-regulated establishment."

The amusing letter from America, offering Medical degrees for sale in this country, which we published in our number of last week, has called forth a communication from a respected correspondent, who has favoured us with the sight of a letter from a gentleman ambitious of possessing a Medical degree, without undergoing the examination which is a necessary preliminary to that honour. The writer applies to a British University to be informed if he can obtain the degree of Doctor of Medicine, in absence, and without any examination, and he states that he has never been engaged in the Practice of Pharmacy, but has confined himself to chamber-studies, having works in preparation for publication. He goes on to observe that he thinks the possession of the degree *would facilitate the circulation of the books*, and he modestly suggests that *if the Diploma could be ante-dated a few years*, it would confer an additional advantage! This gentleman's ambition is not confined to Medical honours, and he accordingly inquires, in conclusion, what other honorary degrees are granted by the University in question without examination, as he is ready to purchase them. We have given the contents of this gentleman's epistle almost in his own words, as a specimen of the manner in which Medical honours and other titles of distinction are often sought for by ignorant and unscrupulous persons for the sake of deluding the public, but we are happy in the reflection that no British University, for many years, has conferred any such titles without examination, except in some very rare and meritorious cases. Under the New Medical Act, we hope that all the British Universities will be still more strict than before in the distribution of their Medical honours, and that the title of Doctor of Medicine will confer upon its possessor not only the reputation of an ordinary acquaintance with the Science of Medicine, but the character of a gentleman and a scholar, in addition to superior attainments in the healing art.

We have received a note from a "Subscriber," a Medical man residing at Armagh, calling our attention to a pamphlet, by the Rev. J. M'Cosh, on the subject of "The Ulster Revival, and its Physiological Accidents." We regret to say, that in this pamphlet we find no description whatever of the physiological accidents in question—indeed, the Author rather puts them aside as being mere "accidents," and as having nothing to do with the essence of the revival. We say we regret this, because we consider that a clear and satisfactory description of the symptoms here spoken of could not fail of being of interest to us as Medical men and physiological observers. And we must express surprise, when we witness the interest which so many members of our Profession manifestly take in these spiritual movements, that no one of them has yet drawn up, in a Medical point of view, a description of the physical phenomena, such as would be comprehensible to the Profession at large. We all desire to know what these phenomena are, and the nature of the subjects in whom they are manifested. Why does not our correspondent endeavour to enlighten us, for he clearly has the materials near at hand?

"I may observe," he writes, "that it is seven weeks since the first occurrence of physical phenomena appeared here in connection with the present revival. During that time, many persons have been awakened, and profess to have found joy and peace in believing. Some of these cases were attended with physical phenomena, the others were not."

We, naturally enough, view these revivals here chiefly in reference to the physical facts attending them; but at the

same time we are glad to see that so many of our Profession, and so many sensible men out of the Profession, consider the movement a solid fact, and not a mere temporary ebullition of Celtic sentiment. Every one must rejoice that such real religious developments, as those here spoken of by our correspondent, should be undeniable facts. Time, which tries and purifies all things, will also test the permanent or temporary character of these we are writing of.

Dr. Steinroth, author of a work on *Récoltes Vivantes* has lately published a pamphlet which has obtained a decided success. It is entitled: *De la chair coulante et de son exploitation rationnelle*. We need hardly say that this *chair coulante* is the blood; and the author proposes to turn it to advantage as an article of human food. We have plenty of cows and milk, he says; but meat is scarce and dear, although there are in Europe three times as many oxen as cows. Let us then establish Dairies of Flesh, taking from animals their blood just as we take their milk. It contains all the elements of nutritious meat. Of course we cannot bleed oxen as often as we milk cows, but still we may bleed the same animal once a week for many years without injuring his health, and without hurting his flesh, which we shall have at last. In this way we may obtain from the ox, the sheep, and pigs three or four times as much alimentary matter as we obtain now through the shambles. The blood may be eaten raw or cooked, pure or mixed, with milk, or vegetables, bread and pastry! There is nothing new in this proceeding, adds the Doctor. In Sweden the blood is used in the manufacture of biscuits; and in Ireland the poor often bleed their oxen and cows to procure a substantial meal, which they could not otherwise have! The last fact will, we fancy, be a novelty to our Irish brethren. Dr. Steinroth adds that in Africa also this blood-eating practice is fashionable. If we remember our African history aright, the negro is not contented with opening a vein, he opens the flanks, &c., of his animals, and cuts off a good rump steak or two, then sows up the wound, until his appetite return again. He prefers the living flesh to the *chair coulante*, if Bruce tell a true tale. The Doctor's blood-dairies seem open to two forcible objections, viz., 1st. The proceeding is repugnant to civilised sense; and, 2nd, The Society for Preventing Cruelty to Animals would interfere with it.

A number of gentlemen who constitute the Edinburgh Anti-Opium Committee, have issued an appeal to the British public against the present traffic in opium in China and the cultivation of that drug in India. It is well known that opium is grown in great and increasing quantities in our Indian possessions, that it is prepared for the purposes of smoking and eating in China, and that this trade has been the pretext for involving us in war with the Chinese. The appeal of the Edinburgh Anti-Opium Committee is accompanied by a statement of facts relating to the British opium trade and Revenues, and in this statement we find the evidence of numerous witnesses to the destructive effects of this agent upon the human body. The facts and arguments adduced in these documents are by no means new, and there can be no doubt that the consumption of opium in China is a source of very general demoralisation. It is a startling fact that opium forms the great bulk of the British returns for Chinese tea and silk, amounting to £3,000,000, while the export of all British produce and manufactures to China averages little more than £2,000,000. While admiring the zeal of the Edinburgh Anti-Opium Committee, and while expressing our strongest disapprobation of the extensive use of such an agent as opium, employed for the purpose of intoxication, we cannot but perceive that this Committee have given only

a one-sided view of the question, and in many of their conclusions we find it impossible to concur. In the first place, we believe that the deleterious effect of opium upon the health and morals of the Chinese has been very much exaggerated, mere general assertions being too often received as equivalent to strict scientific investigation; and it has also been shown that however large the importation of opium into China may appear, yet, when it is compared with the enormous population of that Empire, it is really quite insignificant. Nor can we adopt the conclusions drawn by the Anti-Opium Committee that the intercourse between Great Britain and China has been interrupted by the nefarious trade in opium carried on by our merchants. It is true that the British opium trade was made a *pretext* for war by the Chinese, but if that pretext had not been found, some other would have presented itself to the minds of that extraordinary people. The assumption, too, that the spread of Christianity in China has been retarded by the same circumstance, we believe to be equally groundless; and if the opium trade were abolished immediately, we doubt whether the success of our missions would thereby be in any measure increased. It is well understood that while the Government of the Celestial Empire pretends to condemn the traffic in opium, it actually connives at it; and it is quite certain that if the Chinese were in earnest in discouraging the use of the drug, they could prohibit its introduction into their country. We wish every success to the philanthropic endeavours of our Northern brethren, but the want of a good understanding between the Chinese Empire and the rest of the world is founded upon far deeper bases than the cultivation of the poppy in the plains of India and the exportation of opium to China.

Fines for practising without registration are being inflicted very summarily by magistrates. Last week the Liverpool magistrates fined Mr. T. Howard a sovereign for practising without being duly registered. Mr. Howard had only held the practice he had purchased since the 14th ult. The information was founded on a vaccination certificate given by Mr. Howard. A far more delicate question has also been tried at Liverpool, and the county magistrates have decided that an APOTHECARY, though long designated on his door-plate, etc., as SURGEON before the passing of the Act, cannot continue to hold himself out to the public as a SURGEON unless he is duly registered as a Member of the College of Surgeons. Mr. J. S. Hallows, L.S.A., was fined twenty shillings "for practising as a Surgeon without being duly registered according to the requirements of the Act." There was a great deal of nonsense talked by the lawyers on the case, but for the present we must be content with directing attention to the following observations of the Chairman. He said:—

"The question in the present case is not one of law, but of fact. You see that, according to an Act of Parliament, the defendant is to be registered if he practises as a Surgeon. Now, his name does not appear on the Register, and, therefore, we are unanimously of opinion that a clear breach of the law has been committed. Looking at the case as practical men, and taking the common-sense view of it according to the English language, we do not feel any doubt. The gentleman is practising as a Surgeon; he has his name over the door as a Surgeon; he has it on the bottle that he is a Surgeon as well; and it is clear that if he is a Surgeon he must be registered as such. He could have applied to be registered if he thought fit. Under any circumstances, we must levy a small penalty; and if the gentleman is legally qualified to practise as a Surgeon, he must follow the usual course, and become registered.

"Mr. SNOWBALL: We cannot do that.

"The CHAIRMAN: Then you must take the consequences. We cannot help you."

PROGRESS OF MEDICAL SCIENCE.

Selections from Foreign Journals.

PRESERVATIVE TREATMENT AGAINST
THE CONSECUTIVE EFFECTS OF MEASLES AND
SCARLATINA.

By M. SCOUTETTEN.

THE occurrence of a bad epidemic of measles at Metz, in which several children were lost by negligence during convalescence, has induced M. Scoutetten to republish an account of his preventive management, which he thinks is too little known, although from more than twenty-seven years' experience in its use he can speak confidently as to its efficacy.

It is well known that the early period of measles and scarlatina is not the one in which serious accidents are usually to be feared. It suffices, in order that the eruption should run a regular and easy course to administer some tepid, demulcent drink; not to cover the child with an excess of clothing; to avoid exposure to sudden chills; and to watch over the condition of the functions of the internal organs. It is at the commencement of convalescence that danger is really to be feared, and to avoid this various precautions are recommended, such as a prolonged continuance indoors, etc., etc. Minute regulations of this kind, which can never be fulfilled, are rendered unnecessary by the adoption of the following method:—

When convalescence has commenced, that is to say, when redness of the skin no longer exists, the entire body should be rubbed with oil. Some olive or almond oil having been gently warmed by means of a bath, a piece of flannel is to be dipped in it, and with this the whole surface, without excepting either the face or the feet, is to be rubbed. When the friction is finished the patient is to be put into bed, where he remains for about two hours. Next morning he takes a tepid bath, in which he remains for an hour, when he goes to bed again. When the skin has become quite dry, that is in two or three hours, a new friction with the oil is to be made. These two frictions and one bath frequently suffice to prevent all danger. Still when the eruption, especially in scarlatina, has been very considerable, when the dead epidermis is not completely detached, and when the skin is dry and flourey, we must renew the means until the natural suppleness is restored. The author has seldom had to go beyond four frictions and two baths; and, after these precautions, hundreds of cases have convinced him that no danger or inconvenience results from allowing the convalescents to go into the open air. But the entreaties or tears of the child to have the face excepted from the frictions must be disregarded—negligence in this respect often leading to swelling and infiltration of the cheeks and eyelids.

In explanation of the efficacy of this method it must be remembered, that during the convalescence the functions of the skin are suspended or impeded, and the kidneys and mucous membranes of the respiratory and digestive canals tend to supply its deficiencies. Hence we have a thick, sedimentary, and sometimes an albuminous urine, obstinate diarrhoeas which may promptly lead to emaciation or death, obstinate coughs, sore throats, pneumonia or pleurisy, with effusion; together with infiltrations into the serous tissue or accumulations in the serous cavities. These accidents are especially produced by chilling the skin, inflammation having rendered it more sensible, while its functions are impeded by an inert epidermis obstructing its pores.—*Moniteur des Hôp.* 1859. No. 13.

ON AN UTERINE DILATOR.

By Dr. STORER.

This uterine dilator is a modification of the instrument suggested by Mr. Spencer Wells (*Medical Times and Gazette*, July, 1858, p. 84) for dilatation of the female urethra. It consists essentially of three portions: a distensible one—the dilating medium—a hollow staff, for support, and as a channel of communication, and an external source of supply. Introduced undistended within the cervix any amount of dilatation may be effected. In place of the india-rubber tubing employed by Mr. Wells for the construction of the sac, which

is too bulky, and is liable to be acted upon by the vaginal fluids, Dr. Storer employs gold-beater's skin; "and in practice I have found the membranous sheaths sold for the prevention of pregnancy, to be admirably adapted for the purpose; an end certainly much better than that to which they are usually applied. The staff should be of silver, hollow, about ten inches long, of a diameter varying with the case, and perforated at its farther extremity. A male catheter, having a very slight curve, corresponding with the pelvic axes might suffice. In pregnancy, however, where the dilatation is for the purpose of inducing premature labour, the tube should be of larger size than would be otherwise necessary, or it should be flattened, to guard against laceration, or too sharply-defined a pressure. Near the close of gestation, when the cervix is nearly effaced, the tube, if circular, should be at least one-sixth of an inch in diameter. The employment here of the ordinary flexible gum-elastic catheter will generally be found preferable, as this, by means of its wire stylet can be made to assume any desired curve during introduction. After the wire has been withdrawn, this flexible staff occupies so little space, and is so yielding, that it can occasion no injury to either mother or child." For the common syringe employed by Mr. Wells, Dr. Storer substitutes Higginson's elastic pump, which, when attached, forms with the rest of the instrument a continuous tube. The sac is thus attached to the staff. "A moveable ring, bevelled on the edges, is applied to the circumference of the staff. It should consist of gutta-percha, which perfectly retains its position, without being too unyielding, and yet is easily removed when required after softening with hot water. The sac having been slipped over the staff, it is fastened to it, and confined within any desired limits by a pair of ligatures, the one above, the other below the ring—a third ligature being applied more externally to confine the otherwise loose outer extremity of the membranous sheath. To the upper end of the staff a flexible tube is attached (of sufficient length to extend beyond the bed-clothes, and prevent any exposure), fitted with a stopcock, by which the amount of pressure can be regulated at will. To the outer portion of this stopcock the pump is joined by a small india-rubber coupling, which readily permits its removal." The fluid used as the dilating agent should be slightly warmed, and the presence of air carefully guarded against.

A case is given in which this dilator acted very satisfactorily in the induction of premature labour, and Dr. Storer is of opinion that this mode of procedure approaches nearer than any other to the normal process at the full period. It is equally well adapted for cases of rigidity of the os uteri, of premature rupture of the membranes, and for all complications where it is desirable to produce immediate dilatation, and the completion of the first stage of labour. In all cases in which dilatation of the ungravid uterus is indicated, this form of dilator can be used, if the cervix is at all pervious—its employment requiring to be preceded by the perforating trocar in cases of occlusion.—*American Journal of Medical Science*, July, pp. 107-113.

ON THE USE OF ELECTRICITY IN PARALYSIS
AND CATARRH OF THE BLADDER.

By M. PETREQUIN.

M. Petrequin observes that there are various species of paralysis of the bladder which require to be distinguished from each other in respect to prognosis and treatment. Sometimes it is essential and primary, and then it may supervene upon disturbance of the nervous system (as concussion of the spinal marrow, great fatigue, rheumatic neurosis of the bladder, asphyxia from charcoal vapour, etc.). One of the commonest causes is an error of diet. In such a case a vicious circle becomes established; for while, on the one hand, the bladder cannot accomplish miction, and retention is the consequence, on the other hand, the fluid, in accumulating, distends the bladder and causes it to lose more and more of its elasticity by the very fact of the distension, which is rapid and considerable. In such cases, electricity completely succeeds. At other times, the paralysis is symptomatic or consecutive. An obstacle occurs to excretion. The bladder reacts against this with success at first, but in proportion as the obstacle increases this success diminishes. This increase of energy produces in the long run hypertrophy of the walls of the organ, but in the end it comes to pass that the bladder is unable to empty itself entirely. The prolonged tension destroys

the elasticity of its walls, and in spite of the increasing hypertrophy, the persistence of the obstacle leads to their paralysis—hypertrophy and paralysis of the bladder being the final condition. Electricity may here prove of notable service under two different circumstances. 1. The obstacle disappears or diminishes, but the affection has been produced and it survives the cause which gave rise to it—the vesical paralysis remaining as a disease, which is usually most tenacious in enfeebled persons, and especially in the aged. 2. The obstacle is moderate or incomplete, and an increase in the energy of the bladder may overcome it, or, at all events, render its influence less sensible. [The author laid before the Academy cases in which electricity had completely succeeded under these circumstances.]

In applying this remedy to vesical catarrh, we must first eliminate the acute and subacute stages which contraindicate its employment. Among the varieties of chronic catarrh one may be especially indicated. It is met with in debilitated and aged subjects, and is always complicated with a certain amount of vesical inertia—the catarrh and the inertia reacting on each other most mischievously. On the one hand, the bladder, enfeebled by age or by disease, is not able to completely empty itself, and it allows the urine to stagnate, and become altered in composition. On the other hand, the muco-pus of catarrh, mingling with the urine, aids its decomposition, so that it becomes acrid, fetid, and ammoniacal. This acts upon the walls, irritating them, and exhausting their contractility. In proportion to the duration of this state of things, the catarrh and paralysis both become worse, and the consequences of the complication are increased. But, if by some heroic means we are enabled to at once remove the paralysis of the organ, and restore such resilience to its walls as to enable it to entirely expel the urine, the face of things becomes rapidly changed.

The mode of electrification is not a matter of indifference. The induction-apparatus which furnish the volta-faradic currents are those which are most suitable for paralysis of the bladder. It is to be remembered that the electric current directed along the nerves should only possess a moderate energy, so as to replace or reinforce the physiological action of the nerves. If too prolonged, even though moderate, the excitability of the nerves may become enfeebled or exhausted. The applications should be short and moderate, and localised to the nerves which it is desired to excite. For paralysis of the bladder this is best accomplished by placing one exciter in the bladder, and the other in the rectum. The urine should also be left in the bladder, where it serves as a conductor to the entire internal surface of the organ.—*Bulletin de l'Academie*, tome xxiv. pp. 923-9.

ASSOCIATION of the Fellows and Licentiates of the King and Queen's College of Physicians, Ireland. Instituted 1816. Session 1859-60. Officers for the year:—*President*.—The President of the College of Physicians. *Vice-Presidents*.—Robert Law, M.D., M.R.I.A.; Charles O'Reilly, M.D. *Council*.—Alfred H. M'Clintock, M.D., M.R.I.A.; Henry Kennedy, M.B., M.R.I.A.; Lombe Attbill, M.B.; Fleetwood Churchill, M.D., M.R.I.A.; Thomas Fitzpatrick, M.D., etc. *Treasurer*.—George A. Kennedy, M.D., M.R.I.A. *Honorary Secretary*.—William Moore, M.B., M.R.I.A. The meetings of the Association are held in the College Hall (Sir Patrick Dun's Hospital) on the evenings of the first Wednesday in each month during the session, at 8 o'clock p.m.

THE BRITISH ARCHAEOLOGICAL SOCIETY this year exercises its functions at Newbury; and the meeting there was last week opened in form by the Earl of Carnarvon. Mr. Pettigrew, we observe, on the first evening of the Congress read a paper concerning the cause of death of a lady—one Lady Amy Robsart—at Cumnor, in 1560. He reviews the whole circumstances attending her death, and believes that she was not poisoned. He therefore rejoices in rescuing the character of Lord Dudley from the stigma attached to him in connexion with the supposed crime. Mr. Blundell, however, did not sympathise with Mr. Pettigrew's views, nor did the majority of visitors, who were decidedly in favour of my Lord's guilt. [Is this or is it not ingenious trifling to be solemnly discussing such a question of a date of 300 years ago, when at this very moment under our eyes and noses, with all the wide-awake science of the day to help them, the learned cannot conclude yes or no as to the guilt of a reputed poisoner?]

GENERAL CORRESPONDENCE.

RESULTS OF CANCER TREATMENT BY CAUSTICS.

LETTER FROM DR. DRUITT.

[To the Editor of the Medical Times and Gazette.]

SIR,—In your last number, you ask for information respecting the fate of persons subjected to the cure of cancer by caustics. I will give the following as a contribution. A short statement of the case is published in the new edition of the "Surgeons' Vade-Mecum," but I will give here a few details for which there was no room in that work:—

On May 15, 1857, I visited a lady who was undergoing the treatment. I did so at her particular request, in the hope, as she said, that I should be liberal enough to waive my prejudices against a concealed method of cure, in consideration of the inestimable benefits which it conferred on patients otherwise incurable.

The lady, aged 46, was the wife of a clergyman, and childless. Fifteen years ago she struck the left breast; a lump followed, which slowly increased, and during the last few years had become very painful. There was an enlarged gland in the axilla; which, together with the breast, and some glands above the clavicle, were the seat of frequent pain, both wearing and rheumatic, and at times neuralgic and violent. Yet, though an invalid, she was able to go to church, to enjoy society, and to help her husband in a very poor parish.

She had been seen by several Surgeons, each of whom declared that the case was not fit for operation.

In this hopeless state, condemned to a life of slow misery, she described her feelings as most enthusiastically grateful, when she heard of the new cure. She believed, that in "special answer to prayer," relief had been sent her when all human hope was lost.

Accordingly, in March, 1857, she put herself under the care of a gentleman who made the cure of cancer by caustics his occupation. She took lodgings in the suburbs to be near him, and soon found herself in the middle of a select cancerous coterie, to which the time of the Doctor was devoted.

On the 25th March, as she told me, operations were begun by the destruction of the skin of the whole breast, including the nipple, and including likewise the skin over the enlarged axillary gland, by nitric acid. Her description of the agony caused by this process was most vivid. Night after night she used to sit upright in bed, moaning and rocking herself to and fro in agony. No fire could produce such a burning as she endured; and, as one consequence of the irritation of the breast, a most profuse flooding came on. Shortly, a portion of the slough was gently cut into ("as you would cut into the rind of roast pork," were her words) and various substances introduced into the cuts. The pain of this process was most intense and continuous; the discharge also enormous; but it appeared a part of the system, and a judicious one, that she was carried out every day into the fresh air of the garden, and was plied with wine and nourishment in the greatest abundance. Such was her state on the 15th May; she had escaped, as she said, imminent danger of death by exhaustion; and was feeble and haggard looking, but hopeful and confident in the extreme, begging me, if I had any cancer patients, to send them at once to be cured. One substantial benefit,—little enough, by way of compensation,—was, that she had lost the old cancerous pains above the clavicle. Be it observed, the slough had not separated at the time of my visit.

On the 18th of December, I saw her again: but now her story was a far different one. She said that the original slough was six weeks in coming away, and even then had to be cut away; and that the wound was but just healed, if healed it could be said to be; for in place of the breast, there was a large thin, red, shining cicatrix, glued to the ribs, which cracked and bled every time she coughed, and gave more pain than the cancer it took the place of. Her breathing was difficult, her cough incessant; there was a bunch of enlarged glands above the clavicle, and the lung was evidently infiltrated and solid. She was emaciated, and without strength or appetite, or hope. And now the change in the mental

condition was remarkable. Whilst admitting the personal kindness she had received from the cancer curer, she condemned the whole treatment as a delusion, and hoped I should dissuade anyone from making the same rash experiment. She gave me the names of three ladies who had been under treatment at the same time with herself, and who were already dead: and she followed in little more than a month. She died February, 1858.

The moral of the story is evident. A poor woman, with chronic cancer, whose life would probably (judging from the rate of progress of the disease) have lasted three or four years at the least, if left to herself, during which she might have enjoyed many of the comforts of life, submits herself to one of the most barbarous proceedings imaginable (an old, obsolete, and proved-to-be-worthless process; so cruel, too, that no one would venture to do it openly in an Hospital), suffers months of torture, cuts her life short, and makes it intolerable while it lasts. She ends with a scar twice as painful as the cancer, and with a disease which instead of gnawing her shoulder, penetrates her ribs, and adds suffocation to her other tortures. And why all this? What is the keystone of her error and of that of thousands of others, especially among the clergy, who as is well known and regretted, are the chief patrons of every kind of quackery? It is a want of practical faith in the Divine government of the world. "Labour is the price which the gods have set on all that is valuable," as Sir Joshua Reynolds has it. Providence seems to have ordained slow, painful research, generation after generation, as the means of getting a knowledge of the nature of disease, and the power to heal it. As the world is constituted, there is a large number of men who devote their lives to the acquisition of this knowledge, and who unitedly must be able to say what means of relief in the present state of science are within our reach, what means are safe, and what, whether safe or not, have failed. These men are no special caste, with exclusive secrets; on the contrary, they are our own brothers: they publish everything they know, and they have, instead of repugnance, a very greediness for new discoveries in their art. Is the Almighty likely to deny to their honest industry and open benevolence a knowledge which He would give unasked to dreaming adventurers? But these unfortunate patrons of quackery think to get to the end by a short and private road; they want wonders and miracles, and fancy that the Almighty reveals special modes of cure to those who conceal them, or sell them for their own exclusive benefit.

I am, &c.

37, Hertford-street, London, W. R. DRUITT.
October 10, 1859.

PUBLIC VACCINATION.

LETTER FROM DR. E. W. SULLIVAN.

[To the Editor of the Medical Times and Gazette.]

SIR,—I, being one of the public vaccinators who have made no return to the Registrar of Cases, have a few words to say on Mr. Griffin's letter to the Privy Council.

First. Why have I not made the returns? At the first passing of the Vaccination Act I supposed that such returns would entail the prosecution of the parties who had not complied with the law; experience taught me, that notwithstanding the cumbersome and troublesome machinery called into action, the Act was a dead letter. No person was prosecuted, for the simple reason that there was no one to prosecute. I have since invariably given a certificate of vaccination to the mother or nurse of the child vaccinated (I think it right to do so, in order to protect them), but I did not feel it necessary to provide the Registrar-General with statistics, if such statistics were to lead to no good result. I am sorry to see that Mr. Griffin's exertions, laudable as they are, have led him into a "leetle" red-tapeism. Why should he suggest penalties for improbable acts? Why suggest that the affair is with Medical men a mere £ s. d. question? Above all, why does he sanction that most odious and unpleasant duty,—I mean calling upon parents and guardians of children to stimulate or threaten, as the case may be?

Mr. Griffin will, I am sure, see that such proceedings are altogether outside a Medical man's province; he is a party interested pecuniarily in all vaccinations, and as such should

not degrade himself by touting for cases. Unfortunately there are only too many men in the Profession who would be glad of such an opportunity of distinguishing themselves, especially if the parents and guardians were other men's patients; but I know my friend (I am a Poor-law Medical Officer) Mr. Griffin is as averse as I am to countenancing their wretched trade tricks.

The remedy for the present vaccine difficulty is so palpable, that I wonder so clear-sighted a man as Mr. Griffin has not seen it long since. The machinery is at hand, and it will not be necessary to change at all essentially from the present system.

At present every child is registered at its birth, and the Registrar gives a paper detailing the pains and penalties of the Vaccination Act. It is only necessary that he should be empowered to prosecute the parents, or whoever has the charge of the child, if a Medical certificate of vaccination be not produced in a certain specified time (say three months and a fortnight) from the day of birth. Thus the onus is removed from the shoulders of the Medical man, and the whole affair is reduced to a question of State Medicine.

I may add, that I would have *all* the penalties paid to the Registrar, and if the child's health did not permit of its being vaccinated, a certificate to that effect should be produced.

I am, &c.

Great Ilford, Essex.

E. W. SULLIVAN, M.D.

AMPUTATION OF THE PENIS.

LETTER FROM MR. E. G. LYSER.

[To the Editor of the Medical Times and Gazette.]

SIR,—In the *Medical Times and Gazette* of last Saturday, I observed a note from Mr. Teale, of the Leeds General Infirmary, in which he describes a plan he has adopted for preventing closure of the orifice of the urethra after amputation of the penis; the same method, he observes, is applicable to cases of stricture at the glans.

I would beg to direct his attention to the following passage from the late Mr. Colles' work on the Venereal Disease (p. 95):—

"I am happy to say that I have lately discovered a mode of treating this stricture, which has proved eminently successful in the few cases in which I adopted it. This plan of treatment consists in this simple operation:—Having detached the skin from the end of the urethra, to which it is generally intimately adherent, I divide the urethra below, to the length of more than half-an-inch. I raise the mucous membrane from each lip of the incision, then cut away a portion of the bared corpus spongiosum, to such an extent as will allow the raised mucous membrane to cover the cut edge. I stitch down this membrane upon the corpus spongiosum; and thus having covered each lip of the wound by mucous membrane, I have effectually guarded against the possibility of reunion of the lips of the wound, or subsequent contraction of the opening."

I am, &c.

E. G. LYSER, House-Surgeon,
South Dispensary, Liverpool.

October 10, 1859.

THE WEYMOUTH INFIRMARY.

LETTER FROM DR. MOORHEAD.

[To the Editor of the Medical Times and Gazette.]

SIR,—My attention has been drawn to some remarks which appear at page 365 in the current number of your Journal, affecting the Professional honour of the Medical officers of the Weymouth Infirmary, and I trust that you will give insertion to this letter in your next number.

The Weymouth Infirmary, which is a mere appendage to the original Dispensary, contains only nine beds; and, as already stated in my letter to the *Times*, being entirely supported by voluntary contributions, is intended only for the reception of patients from the town and its immediate neighbourhood. The sufferers from the *Great Eastern* explosion being, therefore, ineligible for admission, according to the rules of the Institution, it was solely through considerations of humanity that the authorities were induced to admit them,

the Great Ship being totally unprovided with Hospital accommodation. Further, the poor men were admitted with the understanding that all expenses incidental to their treatment while in the Infirmary, should be paid by the Ship Company, and that their own Medical officers should attend to them. From some misunderstanding on their part, the latter condition was not complied with by the Surgeons of the ship until they received the subjoined letter from the Medical staff of the Infirmary:—

"To the Medical Officers of the *Great Eastern*.

"Gentlemen,—When we consented to take into our Infirmary the men injured by the accident on board the *Great Eastern*, we did not suppose you would have thrown the onus of attending to those sufferers on the Medical officers, all of whose services are rendered gratuitously to the Institution. We had expected that one of the Surgeons at least belonging to your staff would have been daily in attendance upon those men, and we request that such attendance may be rendered in future.

(Signed) "WM. SMITH, M.D., Consulting Physician.

"JAMES LITHGOW, M.D., Consulting Surgeon.

"JOHN MOORHEAD, M.D., Surgeon.

"Weymouth Infirmary, Sept. 18th."

It will thus be perceived that the refusal of the Medical officers of the Hospital to attend further upon the unfortunate men, instead of being a "strike," was simply a reiteration of their conviction that the Surgeons of the ship were in duty bound from the first to take Medical charge of their own men, while receiving the accommodation of the Institution.

Our attendance upon them for the week should be considered as a favour to the Medical officers of the ship, rather than a duty imposed by the responsibilities of our office. The fact of our services being gratuitous or non-gratuitous, does not affect our position. The poor men were taken in with the understanding that they were to be attended to by their own Surgeons, and the course pursued by the Hospital staff was simply in accordance with that understanding. Whether or not our proceedings were consistent with the highest Professional honour, we willingly leave to the Profession to decide.

I am, &c.

J. MOORHEAD, M.D.

Surgeon to the Weymouth Infirmary.

October 10th, 1859.

[We have omitted some portions of this letter, clearly written under a misunderstanding of our meaning. We spoke of the case as one requiring explanation. That explanation Dr. Moorhead has now afforded. Had he been as explicit in his letter to the *Times*, our notice of the case would not have been called for. We must, however, quote the following passage from Dr. Moorhead's letter to the *Times*, and leave the matter to the judgment of the Profession.—Ed.]

"At the request of the Medical officers of the ship, the unfortunate men were admitted into this Hospital, and received from its Medical staff alone all the care and attention requisite in their respective cases for a period of eight days after their admission. The Medical officers of the Hospital, whose services are rendered gratuitously, then formally requested the Surgeons of the ship to take the poor men into their own charge, finding that attendance upon them exacted an amount of time wholly incompatible with the performance of their other Professional duties."

FEIGNING DISEASE.

[To the Editor of the Medical Times and Gazette.]

SIR,—The following case will, perhaps, furnish a hint to some of your readers on the above head. A man came to me a short time ago, requesting a certificate as to the condition of his heart and lungs. He had no symptoms of any kind which indicated disease of either one or other of those organs, and in fact was a strong, hearty-looking fellow. I ran my ear rapidly over his chest, and told him that as far as I could judge he had as sound a set of organs as any man need desire. I then asked him what he wanted the certificate for; and he told me that some time ago a Medical man had certified he was suffering from organic disease of the heart, and his club, to which he had been many years attached, had threatened in consequence to eject him for concealing his

maladies. His employment was engineering, and his work had been for years of a very heavy kind. He declared also that at the time he saw the Medical man, he was just in as good health as he was at the present time; and then, on my expressing surprise that the Doctor should have condemned him, he said, "Why, sir, the fact is this, he saw all these cupping-marks over the heart, and these settled his opinion." These marks I had not myself seen, having examined the man without removing his shirt. Of course I enquired about the meaning of them, and again examined his heart without detecting the slightest inaccuracy in any of its sounds or movements: and he now told me his history. He had been, ten years ago, in a Cavalry Regiment, and getting sick of the service, determined to get his discharge by making himself sick. This trick he accomplished by swallowing tobacco-juice. He first got into Hospital, and when there, regularly took a dose of his juice about twenty minutes before the time of the Doctor's visit. This dose always set him a vomiting, and made his heart jump about very queerly. In the end, as he asserted, he thus obtained his discharge. And this was also the history of the origin of the cupping-marks. "Besides," he added, "they always give us an extra cupping when we are discharged from the army." I am, &c.

London.

W. O. M.

P.S.—It is to be much wished that this very unjustifiable proceeding of cupping a disabled soldier, when discharged from the service, should be abandoned. It is manifestly quite contrary to the feeling and spirit of the age, and is fit only to be associated with branding and flogging—both of which proceedings, we may be very sure, will at an early period become obsolete. Nothing can justify the proceeding of marking a man, by cupping him, so as to prevent his again entering the army. His disease is no fault of his; and how would it turn out if the cupping cuts were to take on an erysipelatous inflammation and destroy the man?

REPORTS OF SOCIETIES.

OBSTETRICAL SOCIETY OF LONDON.

WEDNESDAY, OCTOBER 5TH, 1859.

DR. RIGBY, PRESIDENT, IN THE CHAIR.

A Paper by J. H. TROUNCER, M.D., was read, on THE INDUCTION OF PREMATURE LABOUR IN A CASE OF DISTORTED PELVIS.

In the case related the patient had had eight children: the first three labours normal, children alive; in the fourth, turning and death of the child; in the fifth, the forceps was used, and the child born dead. The author attended her in her sixth labour; the result as in the former case. In the seventh pregnancy premature labour was brought on, at the eighth month, by means of an alternate injection of hot and cold water into the vagina by the use of a powerful syringe: the result was successful. In the next pregnancy (the eighth) similar means were adopted, but this time a long flexible tube was passed into the cervix uteri, and water thus injected. In four days, labour set in; the shoulder presented; the child was turned, but the cord was twisted round the neck, and the child's life was in consequence sacrificed.

Dr. MACKENZIE preferred the catheter to the douche, as a means of inducing premature labour.

Some discussion took place as to the general propriety of injections into the uterine cavity, in which Dr. Tanner, Dr. Druitt, Mr. Edmunds, and Dr. Barnes joined.

Dr. GRAILY HEWITT exhibited

A FŒTUS IN WHICH THE ANTERIOR ABDOMINAL WALL WAS DEFICIENT.

The specimen was forwarded to him by Mr. Sedgwick, and from the account given of the case it appeared that the elbow presented, and during the progress of the labour the protrusion of the intestines through the aperture in the parietes of the abdomen, covered only by peritoneum, was felt by the

fingers, and produced an impression that the placenta was in contact with them.

Dr. HALL DAVIS showed a specimen of

OVARIAN GESTATION,

The particulars respecting which are as follows:—The patient, aged 25, never previously pregnant, began to suffer in March from severe abdominal pain, and above the right pubis was found a well-defined enlargement, very tender to the touch. On May 14 Dr. Davis first saw her, and found a large tumour extending to the umbilicus, and occupying chiefly the left iliac region, fluctuating, and resembling an ovarian tumour. Mammary symptoms of pregnancy, somewhat undecided and of doubtful import, were present; cervix uteri high up, inclined forwards; os not having the cushion fullness of early pregnancy; body of uterus a little enlarged; length of cavity, three inches and a-half. Behind the cervix was a soft tumour, evidently continuous with that felt above. The diagnosis on this examination was, that the tumour was of extra-uterine character, and that within the cyst were foetal contents. A canula and trocar were introduced into the tumour behind the cervix, and a quantity of fluid evacuated; but the patient refused to allow of further projected operative measures, and died on July 9. The left ovary was found developed into a cyst, situated between the uterus and rectum; interior of cyst sloughy and putrescent; it contained a decayed foetus and remains of placenta, all of a dark colour.

Dr. HALL DAVIS also exhibited a

POLYPUS OF THE UTERUS,

About the size of an orange, which he had removed by means of the ligature and bistoury. The diseased mass protruded from the vagina, and gave rise to very considerable losses of blood and discharges.

A paper, by GRAILY HEWITT, M.D., M.R.C.P., was read

ON THE HYDATIDIFORM OR VESICULAR MOLE: ITS NATURE AND MODE OF ORIGIN.

Cruveilhier was the first to demonstrate conclusively the non-hydatid character of those bodies discharged from the uterus in cases of so-called hydatid pregnancy, which view of the case has been established by many observations subsequently made. Many essential points in reference to the nature and mode of origin of the hydatidiform or vesicular mole remain, however still, *sub judice*. In the present paper it was attempted to reduce the series of facts already on record into something like a system, and to offer a solution of certain questions not yet satisfactorily or clearly answered. The author then described the particulars of a case in which a specimen of the hydatidiform mole was expelled from the uterus seven months after the birth of a first child, and during the process of lactation. The patient did not suspect her pregnant condition, but for about six weeks the milk had increased in quantity, and fulness of the lower part of the abdomen and constipation had been noticed. The ovum, expelled entire, was apparently about two months old, and, on examination, offered a most perfect and interesting specimen of commencing hydatidiform degeneration of the ovum; the circumstance that the whole came away together afforded an opportunity of examining the parts as they had lain in the uterine cavity: the decidua uterina only was very slightly torn. On cutting vertically through the whole mass, the following appearances were met with. The amniotic cavity was empty; no embryo discoverable; the chorion and amnion membranes were adherent; about half of the chorion villi (the whole of those corresponding with the decidua serotina) presented the hydatidiform change; the remainder were covered by the decidua reflexa, shrivelled and small. The chorion villi proceeded from the chorion membrane, in their passage towards the decidua serotina becoming enlarged at intervals into rounded bladder-like bodies, one-sixteenth to one-sixth of an inch in diameter. Microscopic examination showed these vesicular bodies to possess the same structure as that of normal chorion villi, but the cells on the surface were wider apart, and the villi distended by a serous fluid, giving rise to the enlargements. The appearances observed did not differ materially from those described by Cruveilhier, Mettenheimer, Gierse, Wedl, and others. The point respecting which opinions have been divided is—What is the nature and cause of the change in the chorion villi, which results in the pro-

duction of these hydatidiform bodies? Mettenheimer, followed by Paget, declares them to be cysts, while Gierse considers that the change consists in hypertrophy of the natural structures of the chorion villi with secondary oedema. The "cyst" view the author dissented from altogether, and considered it positively disproved by observation of the specimen and the drawings of the same produced, and by comparison of the altered villi with normal villi at about the same period of development. From this it would be seen that in the normal villi and in the altered ones we have precisely the same structures; it is not, then, necessary to have recourse to a cyst theory to account for the appearances. The cells on the surface of the villi are seen alike in the two cases; the vesicular enlargements evidently do not originate in them, and Gierse's opinion as to the essential anatomical character of the change is far nearer the truth. In fact, in the hydatidiform mole, we have not a new formation, but simply an alteration and degeneration of previously existing structures. The next point is—What are the circumstances which determine this pathological alteration? On this subject the author differed materially from previous observers. Universally the transformation has been supposed to be the starting-point of the affection; that the disease of the chorion was the cause; the death of the embryo the effect. On the contrary, he contended that the death of the embryo occurs first, the chorionic transformation subsequently. The hydatidiform mole results from a degeneration of structures arrested in their development. Death of the embryo involves arrest of chorionic development, but not necessarily cessation of vitality in the chorion villi; these may continue to grow, and this peculiar growth, for a persistence of which it is necessary only that the decidua be not separated from the uterus, will then result in the formation of the hydatidiform mole. After obtaining a certain degree of development, the chorion villi do not appear to be capable of undergoing the change in question; the conditions necessary for that change are not present, and if the foetus dies, no hydatidiform mole can be produced. The middle or end of the third month is probably the limit within which the change can originate. With respect to the embryo; in most cases of hydatidiform change no trace of it is detected; when found it is always very small. The evidence on this point, then, shows that the embryo perishes at a period so early as to leave no traces behind it, or that it does not survive a period roughly to be fixed at the end of the second month. We find, then, that all known facts are quite in harmony with the theory now offered as to the cause and nature of the hydatidiform transformation. Some remarks were then made as to the cause of the death of the embryo in such cases. The author considered that, in the case of the patient above described, and in cases like it, it was very probable that the death was due to long-sustained but slow contraction of the uterus, produced by the irritation of lactation. Such contraction would diminish the nutrition of the villi, and in the end cause the death of the embryo. As confirmatory of this opinion as to the influence of lactation in producing abortion, some observations published by Dr. Barnes were mentioned. Dr. Barnes found that, in a number of cases of abortion of non-special character, into the particular of which he had inquired, abortion occurred in 17 per cent. of cases of conception during lactation, and in only 10 per cent. of other cases. On this subsidiary branch of the inquiry, however, only speculative opinions were put forward. As to the interesting question of the possibility of a portion of retained placenta taking on the hydatidiform change, the following opinion was offered:—The placenta of a mature foetus cannot be so changed, but appearances giving rise to an erroneous conclusion on this point might arise—1st, in cases of double conception, one of the ova perishing at an early period, and the degenerated chorion villi remaining in the uterus after the normal birth; and, 2ndly, in the perhaps possible case of a portion of the chorion villi having changed, from accidental separation from the embryo, the remainder growing normally.

Lastly, the question, Can true hydatids be expelled from the uterus? was considered. The author was inclined to admit the possibility of this occurrence. When so expelled the hydatids arise, doubtless, in the uterine wall, and subsequently burst into the cavity of the uterus. A very simple examination would be sufficient to distinguish between such bodies and the hydatidiform cysts resulting from chorionic change. The fact, that in true hydatids we find cysts enclosed one within the other, and in the other case round or oval

bodies attached one to another, like beads, would be alone sufficient to prevent the possibility of a mistake on this point.

The several points referred to in the paper were illustrated by drawings and preparations.

Dr. BARNES observed that the subject treated in this important paper was one that could scarcely be discussed in a fitting manner without a more accurate perception of the author's views than could be gathered from hearing the paper read. He would, therefore, not pretend to follow even the principal points mooted, but would merely advert to one or two topics which had struck him. He had seen a case of hydatiginous chorion, of about six weeks' pregnancy, passed by a lady apparently in perfect health, who had borne a healthy child before, and another subsequently, who was not suckling at the time, and in whom he did not think the expulsion was caused primarily by uterine contractions. In this case only a part of the chorion was in a state of hydatiginous degeneration; the rest presenting either the normal appearance, or various gradations of degeneration. He had observed a general tendency, in these cases, to complication with fatty degeneration. And the absence of the embryo, which was so commonly the case, was accounted for by its undergoing a process of oily transformation and dissolution, which usually proceeded to the entire disappearance of the fœtus. In one case he had witnessed this process in progress; the lower half of the embryo had melted away, while the upper half remained. He had taken a sketch of this embryo. Dr. Barnes was of opinion that it required further observations to establish the proposition that death of the fœtus must necessarily precede the hydatiginous change. Fatty degeneration certainly did in some cases precede the death of the fœtus; it might be that hydatiginous degeneration might also commence during the life of the embryo.

Dr. Druitt stated that the author had given a very lucid and ingenious explanation of the aberration of placental structure treated of, and he was most ready to concur with him in the position that the (so-called) cystic disease of the chorion was an exaggeration and deformity of natural structure, and was not due to the intrusion of a new element, as in the case of tumours or of hydatids. At the same time he doubted if the proof were complete that death of the fœtus was the only and essential cause. Referring to the extremely complicated nature of some of the changes in the ovum in abortion, and to the difficulty of unravelling the primary from the secondary, he expressed his belief that a kind of apoplectic engorgement of the decidual vessels was the condition which usually preceded abortion, and that the various changes of structure observed in the membranes of the ovum, such as fatty degeneration and fibrinous deposits, in portions of the placenta, were generally secondary; but yet in some cases such changes, he believed, were primary. He observed that it was an anatomical error to speak of the disappearance of any of the villi of the chorion, whether of the placental or non-placental portion of that membrane. On the contrary, the villi of the whole chorion, as he had shown some years ago, continue to grow up to the end of pregnancy, and are readily found in every mature ovum. They are particularly large around the placental portion, and in this part in the membranes at full term he had occasionally found them excessively amputated, as if in an incipient state of cystic degeneration. Hence his belief in the possibility that the cystic disease might be a primary affection, beginning before the death of the fœtus.

In reply, Dr. GRAYLY HEWITT observed that he merely insisted on the fact that the death of the embryo preceded the chorionic change; he had only attempted to account for that death in one particular class of cases. He could not conceive that further observations would materially alter his conclusions, based as they were on attentive consideration of the data afforded on the subject at the present time. He believed that his explanation of the mode of origin of the chorionic transformation was the only one reconcilable with facts; he would request anyone sceptical on the subject to examine the drawings placed before the Society, from which it would be at once apparent that the hydatidiform bodies are merely chorion villi arrested in their growth, but which have undergone a subsequent degenerative change. There was an utter absence of proof that the alteration was anything beyond a passive one, and on his view of the case it was a necessary result of the adhesion of the ovum in the uterus, the embryo having perished.

BRITISH ASSOCIATION.

A Paper by A. B. GARROD, M.D., F.R.S., was read on— THE SPECIFIC CHEMICAL AND MICROSCOPICAL PHENOMENA OF GOUTY INFLAMMATION.

Dr. GARROD remarked that many and discordant views were held concerning the nature of gouty inflammation, and such diversity of opinion arose from the fact, that up to the present time no characteristic structural change had ever been demonstrated to accompany it; the object of his communication was to supply that deficiency, and prove that special chemical and microscopical phenomena invariably attend true gouty inflammation. After alluding very briefly to the views held by the ancients, and within the last century by Murray Forbes and Wollaston, and by Cullen and his followers, and of the difficulties which each had to contend with in applying their hypotheses to the explanation of the various symptoms of the diseases, he proceeded to speak of his discovery of the constant presence of uric acid in the blood in gout, and his subsequent researches in the nature of that disease. From these he first drew the three following conclusions. 1. In *health*, the blood contains minute traces of urate of soda and urea, and probably of all the principles destined for excretion; but the quantities are so small, that the most careful and refined analysis is required to demonstrate their presence. 2. In *gout*, the blood is invariably rich in urate of soda, and uric acid can be readily crystallised from it. 3. In by far the greater number of diseases the blood is free from an abnormal quantity of uric acid, but in certain cases of albuminuria, lead-poisoning, and other affections, its presence can be demonstrated, and still no gouty inflammation ensue. Lastly, in many gouty subjects the same condition exists in the intervals of the paroxysms. From these conclusions Dr. Garrod considered it evident that something more than the mere presence of urate of soda in the blood was required to produce gouty inflammation, and his next object was to ascertain its nature. For this purpose a careful examination of the joints which had suffered was required, and within the last few years many opportunities had fallen to his lot; the subjects of these examinations are divided into four classes. 1. Subjects of chronic gout with extensive chalk stones. 2. Subjects of gout with no appreciable deformity, and no visible deposits of chalk stones, except one or more specks on the external ear. 3. Subjects of gout in whom no trace of chalky matter was externally visible, and in one case only eight attacks of the disease had occurred. 4. Subjects in whom only a single joint (the ball of a great toe) had been affected with gouty inflammation, or in whom some joint had only been once slightly inflamed. These examinations proved beyond the possibility of doubt that in the very slightest forms of the disease, as well as the most severe, a structural change invariably occurs, and that this change when once produced remained, if not permanently, at least for a very lengthened time. After detailing the microscopical and chemical characters of the deposit producing this change, Dr. Garrod finished his communication by stating that he considered the facts which had been brought forward warranted him to conclude that—"Specific, chemical, and microscopical phenomena invariably accompany gouty inflammation, and these consist in the deposition of urate of soda in a crystalline form within the cartilages and ligamentous structures of the joints, and that such deposition is altogether pathognomonic, never being found in any disease other than true gout;" and, again, that "Such deposition is probably the cause rather than the effect of the inflammatory action." Lastly, the author pointed out the great importance of ascertaining the true nature of the disease as a means of conducing to its rational and successful treatment.

The following is a list of other papers of Medical interest:—

PROFESSOR BENNETT, "On the Structure of the Nerve Tubes."

Dr. REDFERN, "On the Admixture of Nervous and Muscular Fibres in the Nerves of the Leech."

MR. B. E. BRODHURST, F.R.C.S., "On the Repair of Tendons after their Subcutaneous Division."

MR. FOSTER, M.B., "On the Beat of the Snail's Heart."

MR. G. H. LEWES, "On the Necessity of a Reform in Nerve Physiology."

DR. J. ADAMSON, M.D., "Lactation in an Unimpregnated Female of *Canis Familiaris*."

PROFESSOR ALLMAN, "Report on the Reproductive Organs of the Hydroid Zoophytes."

DR. G. OGILVIE, "The Genetic Cycle in Organic Nature."

PROFESSOR LAYCOCK, "Handwriting and Drawing of the Insane, as Illustrative of some Modes of Cerebral Functions."

PROFESSOR BENNETT, "On the Origin of Morbid Growths, with Reference to the Connective Tissue Theory."

ROBERT GARNER, F.L.S., "Reproduction in Gasteropoda, and on some Curious Effects in Endosmosis."

WILLIAM MARCET, M.D., F.R.S., "An Experimental Inquiry into the Action of Alcohol on the Nervous System."

PROFESSOR BENNETT, "On the Molecular Theory of Organisation."

W. E. C. NOURSE, F.R.C.S., "On the Organs of the Senses, and on the Mental Perceptive Faculties."

A. B. GARROD, M.D., F.R.S., "On the Specific Chemical and Microscopical Phenomena of Gouty Inflammation."

RICHARD FOWLER, M.D., F.R.S., "A second Physiological Attempt to Unravel the Perplexities of the Hypothesis of Berkeley."

EDWARD SMITH, M.D., "On the Sequence observed in the Phenomena observed in Man under the Influence of Alcohol."

ALPHONSE GAGES, M.R.S.A., "On the Comparative Action of Hydrocyanic Acid on Albumen and Caseine."

W. CAMPS, M.D., "On Certain Subjective Sensations, with especial reference to the Phenomena of Second Sight, Visions, and Apparitions."

W. CAMPS, M.D., "On Certain Imperfectly-recognised Functions of the Optic Thalami."

In the Chemical and Statistical Sections, other papers were read of more or less interest to the Medical Profession; and, amongst these, was a paper on "Colour Blindness," with some statistics thereof, by Professor G. Wilson, of Edinburgh; and a paper on "The Statistics of Small-pox and Vaccination in the United Kingdom: Registration of Births, Deaths, etc. indispensable for a better system of Vaccination in Ireland," by Dr. W. Moore, Physician to the Hospital for Diseases of Children, Dublin.

At no former meeting of the Association, possibly, was the Physiological Section so well and ably supported, inasmuch that, at the concluding general meeting of the Association, the President of the Section, Professor Sharpey, gave notice of a motion, to be brought forward at the next general meeting, to the effect, that a separate section of the Association, devoted to Anatomy and Physiology, should be formed, so as to detach Physiology from Zoology and Botany, to which sciences it has been commonly subordinated in the Association, under the form of a sub-section.

On Tuesday morning, September 20, the Medico-Chirurgical Society of Aberdeen entertained at a very handsome breakfast, in the Society's rooms, the Medical gentlemen known to be present at the meeting of the British Association. The President of the Society, Dr. Redfern, occupied the chair on the occasion, supported by Professor Owen, Professor Bennett, Professor Allen Thomson, Dr. T. K. Chambers, Dr. Lankester, and other gentlemen well known in our Profession from various parts of the United Kingdom.

JEWISH BENEVOLENCE.—The Governors of the Jews' Hospital, Mile-end, deeming it expedient to remove the institution from London, ten acres of land, situated at Caterham Junction, were offered free for the purpose by Mr. Henry Moses, of Cannon-street, City; but the distance being considered too great, it was reluctantly declined, and led to another offer from Mr. Barnett Meyers, Mill-lane, Tooley-street, of six acres at Lower Norwood, of the value of 3000*l.*, a free gift, which the governors have gratefully accepted.

MEDICAL NEWS.

APOTHECARIES' HALL.—Names of gentlemen who passed their Examination in the Science and Practice of Medicine, and received Certificates to Practise, on Thursday, the 6th October:—

BRIGHOUSE, JOHN, Lindley, Huddersfield
BUSIGNY, CHARLES EDWARD, Ombersley, near Worcester
COATHUPE, EDWIN WEISE, Rodney-place, Clifton
GEORGE, AMBROSE BROOKE, Liverpool Royal Infirmary
MYERS, ARTHUR BOWERS RICHARD, Tenby, Pembrokeshire
TAYLOR, HENRY MOORHOUSE, Manchester

The following gentlemen also on the same day passed their First Examination:—

BLOOR, JOHN TABBERER, Newhall-street, Birmingham
CALLON, WILLIAM JOSEPH, Islington, Liverpool
CORIN, WILLIAM JOHN, Redruth, Cornwall
JENNINGS, ROBERT, 6, Mount-street
NEGRI, ATHENODONE DE, 9, Camden-street
STRICKLAND, EDMUND, Kirbymorside, Yorkshire

Successful Candidates at the Competitive Examination for Assistant-Surgeons in the Army, October 6, 1859.

ALSTON, WILLIAM EVELYN, M.D.
COLLIER, JAMES S. C., M.D.
COWAN, ALEXANDER OSWALD, M.D.
GAYE, ARTHUR CHARLES
GUINNESS, HENRY CRAMER, M.D.
HENDERSON, COLIN, M.D.
JARDINE, JAMES BELL
JOYNER, JOSEPH SUMPNER, M.D.
ROYLE, ARNOLD
SCOTT, JOHN ALEXANDER, M.D.
SMYTHE, WM. DUMVILLE
STEWART, JOHN EDMONSTONE, M.D.
TULLOCH, J. T., M.D.
WOOD, THOMAS, M.D.

DEATHS.

BARKER.—October 8, at Wellington-road, Dublin, Francis Barker, M.D., aged 86. Dr. Barker graduated as M.D. in Edinburgh in 1795, and in 1808 was elected Professor of Chemistry in the University of Dublin, an office to which he was frequently re-elected, and which he honourably filled during the lengthened space of forty-two years, or six septennial periods. In 1809 he obtained the degree of M.D. also from the University of Dublin. He was an Honorary Fellow of the King and Queen's College of Physicians in Ireland, and was for many years Secretary to the General Board of Health in the same part of the United Kingdom. In 1821 he published, in conjunction with the late Dr. John Cheyne, whose biography forms a chapter in our memoirs of "The Great Ones of the Past," an "Account of the Rise, Progress, and Decline of the Fever," epidemic in Ireland in the years 1817, 1818, and 1819, to which is prefixed a brief historical sketch of the fevers epidemic in Ireland during the 18th, and the early part of the 19th century. Dr. Barker was also joint author, with Dr. Montgomery, of "Observations on the Dublin Pharmacopœia of 1826," and on different occasions published essays on Fever, Asiatic Cholera, &c.

BEALL.—September 26, at Bulmer, Castle Howard, Yorkshire, Thomas George Beall, late of Beecroft-in-Holderness, M.R.C.S. Eng. 1842, M.D. Genoa; aged 41.

CANN.—October 2, at Seaton, near Axminster, Devon, Thomas Cann, M.R.C.S. Eng. 1827, L.S.A. 1826.

COCKBURN.—October 3, at Blyth, Thomas Cockburn, aged 34.

ELLIS.—September 10, in the township of Oxford, Canada, Dr. Ellis, aged 82.

GILCHRIST.—September 15, at Port Hope, Canada, John Gilchrist, M.D., aged 67. He was the first Licentiate of the Medical Board of Upper Canada, and well known and highly esteemed.

HAMMACK.—August 6, at Cerillos, near Coquimbo, Chili, aged 38, Dr. Frederick G. Hammack, of Coquimbo, third son of John George Hammack, of Boxlands, Dorset.

MACDERMOTT.—October 8, at his residence, 9, Great Denmark-street Dublin Robert MacDermott, A.B., M.B., aged 27. The subject of this notice, cut off by typhus fever in the commencement of his career, was a distinguished classical scholar and a physician of great promise. Educated in Trinity College, Dublin, he gained in that Institution the Berkeley Gold Medal in Greek, a Classical Moderatorship, and other Collegiate honours. Dr. MacDermott was Professor of Materia Medica in the Catholic University in Ireland.

MAINWARING.—October 7, at Broomhill, William Mainwaring, of Sheffield. L.S.A., Lond. 1821.

PATTERSON.—September 27, at Clonmel, Edward Patterson, aged 25.

REYNOLDS.—Sept. 14, in Brockville, Canada, Dr. Thomas Reynolds, aged 38.

SIMMONS.—Oct. 9, at 71, Judd-street, Brunswick-square, George Simmons, aged 50.

TAYLER.—October 1, at his residence, Weston-super-Mare, Milton John Tayler, M.R.C.S. and L.S.A., formerly Surgeon to the Eastern Dispensary, Bath, aged 39.

THORP.—September 9, at Saugeen, Canada West, Walter Thorp, M.D.

WEBBER.—September 26, at Bromley, Middlesex, aged 53, Richard Terroy Webber, suddenly, of disease of the heart. Aged 53.

ON October, the 4th inst., the temperature reached 77.5 deg., in the shade, and 93.2 deg. in the sun. Nothing like this heat has been known in October for seventeen years past.

M. TEILLEUX has been investigating the effects of electricity on mad women, and avers that the remedy is often of service. He also occasionally uses it as a means of coercion, instead of the straight waistcoat and douche; but doesn't say how it is applied in this sense.

It appears from a statistical account, published at Brescia, that the 37 Hospitals, of that town received after the battle of Solferino, 32,916 wounded, viz. 17,345 French, 13,959 Italians, and 1612 Austrians; 26,038 have recovered, and 1273 have died, i.e. about one in eleven.

AMERICAN LUMBRICI.—Dr. Cox, of Salem, relates a case of death from impaction of the intestines with lumbrici. After death 365 common round worms (*ascaris lumbricoides*) were found in the small intestines:—"Before opening the intestine we pushed the mass of worms upwards together, and they formed a solid roll or sausage more than three feet in length."

In his interesting letters from Italy M. Bertherand gives as a cause of diseases among the French army, the abuse of adulterated liquors. He gives the following receipt for the manufacture of campaign wine:—Take water from the nearest ditch, alum, beet-root juice, potato, brandy or any other cheap product of spirit distillation, of each as much as is requisite. Then mix the whole in an old wine cask. This liquor is cheap, paying no tax.

CHOLERA AT BRUGES.—Towards the beginning of last month warnings were given of the presence of cholera, which has since progressed with alarming strides. The ordinary mortality of the town is two or three daily, but for some time past it has averaged from twenty to thirty, and on the 5th inst. we learn on official authority that it reached the unprecedented number of 40, or at the rate of 280 a-week. The population of Bruges consists of 50,000 souls, so that, having regard to the difference of numbers, this is equal to a mortality in London of 15,000 to 16,000 weekly.

A FRENCH PENNY-A-LINER.—"When the shade of Alibert was exiled from the Hospital St. Louis, it found a refuge, or rather a temple in the well-known amphitheatre of the Rue du Paon now called Rue Larrey. There, perpetual incense religiously burns on the altar of the illustrious dermatographer, there, full of life and vigour, like a cedar of Lebanon, flourishes the Dermatosé Tree, which has expired on the ungrateful soil where it was planted. The high priest who guards the altar with a zeal so pious, and who waters the tree with such solicitude, is M. Duchesne-Duparc, the purest, most ardent, and above all the most faithful disciple of Alibert."

ROYAL COLLEGE OF SURGEONS.—From a recent return of the receipts and expenditure of the College from Midsummer-day, 1857, to Midsummer-day, 1858, it appears that the receipts amounted to £13,678 6s. arising principally from the fees paid by candidates for the diploma, viz. £11,371 19s. The midwifery licences produced £333 18s., and the fellowship £871 10s. The expenditure amounted to £10,828 7s. 11d. From a summary it appears that the incidental income is £12,642 2s., the expenditure £7637 14s. 1d. The permanent income is only £1036 3s., whereas the permanent expenditure amounts to £3190 13s. 10d.

SIR DAVID BREWSTER has accepted the Principal's Chair of Edinburgh University in the following terms:—"My dear Lord Provost,—Having had an opportunity of consulting friends on whose judgment I rely, and especially one of the most distinguished living ornaments of the University of Edinburgh, I feel it my duty to accept of the Principal's Chair which the Town Council has so unanimously offered. May I again request that your Lordship will accept for yourself, and offer to the other members of the Council my warmest acknowledgments for the honour they have done and for the confidence which they have placed in me.—I have the honour to be, my dear Lord Provost, ever most faithfully yours, DAVID BREWSTER."

THE *Medical Gazette* of Moscow, speaks thus of M. Léroty d'Etioilles:—"We have at this moment at Moscow, the French Surgeon, celebrated in the annals of lithotripsy. The time which he has passed amongst us will not be without use

to our Surgeons; each day they have had occasion to admire the remarkable skill with which he performs this operation, either in the Hospitals or in private. We have been able to familiarise ourselves with the use of some new instruments for the breaking up of foreign bodies in the bladder, or for their extraction. In this particular, the invention of M. Léroty is boundless; and it is impossible not to admire the perfection of his instruments, as well as the kindness and eagerness with which the honoured Professor explains their uses to those around him."

FRIENDLY SOCIETIES.—The Registrar says: It appears that to establish a Friendly Society on a firm basis, so as to secure to the members the benefits they require, the objects should be—1. Medical attendance. 2. Allowance in sickness until 60. 3. Endowments. 4. Annuities, or old age pay, to commence at 60. 5. A sum payable at death. 6. A provision for expenses of management. Every industrious and provident person should, immediately he begins to seek a livelihood, insure against sickness. Savings banks afford no provision against sickness; for suppose a man to have saved 1s. per week for one year, and then to be assailed by accidents or ill health, he will, at the rate of 10s. per week, consume his savings in little more than a month. On the other hand, a member entering a Friendly Society on the basis now recommended, between the ages of 16 and 23 may, by a payment of 1s. per month only secure to himself an allowance in sickness of 10s. per week, according to the rules and tables.

ST. VITUS' DANCE.—"The pilgrims," says M. Trousseau, "who came from all parts of Germany to be cured at the Chapel of St. Veit, were the subjects of very different nervous affections. There were amongst them hypochondriacs and hysteric individuals, and even rascals. There were also true veritable choreic patients. All these people danced like mad ones. The true choreics—those which I call such—would have found it difficult to dance at all. And at an epoch much nearer our own times, whole populations have sought a cure of very different affections—all confounded under the name of King's Evil. Before the Revolution of 1688, James II. laid his hands on 22,000 persons; but it is evident that all of them could not have suffered from scrofula. Sydenham has clearly distinguished St. Vitus' Dance from all other kinds of chorea; and I think we ought to accord to the word Chorea a generic sense, and reserve to the term St. Vitus' Dance a specific sense."

ALTERED POSITIONS OF THE HEART IN HEALTH.—A girl, aged 18, entered the clinical wards of Professor Bruns, suffering from an enormous sub-umbilical intestinal fistula. Through the opening the finger was readily passed, and the abdominal aorta, the kidneys, the pancreas, and the liver might be felt. In passing the finger between the liver and diaphragm, the point of the heart could be readily felt, and hereon the following observations were made:—The patient being erect, and the finger applied against the inferior walls of the ventricles, there was felt at each systole a short, dry knock, slipping a little on the diaphragm, the apex of the heart at the same time becoming hard, and moving a little to the left. The blow was perfectly visible externally on the walls of the chest. The result was the same when the girl leaned forward, only the blow was stronger; on the contrary, when she leant backwards, the finger being kept on the same spot, there was an instant observed when the heart's movement was neither seen nor felt. Other experiments showed that the heart does not retain an invariable position, as Helmerich imagines.—*Deutsche Klinik*.

COMMITAL OF A MIDWIFE FOR MANSLAUGHTER.—Mr. Chandler, coroner for Hants, held an inquest on Thursday last, at the Royal Hotel, Aldershot, on the body of Bridget Turner, aged 26, wife of a sawyer, whose death appeared to have resulted from the unskillfulness and neglect of a midwife named Ann Young, whom the deceased had engaged to assist her. It appeared that the case from the commencement of the labour exhibited a very serious aspect; but, notwithstanding some neighbours present urged that a doctor should be sent for, Mrs. Young represented that it was quite an ordinary case, which she was perfectly competent to conduct. Ultimately, deceased was delivered of a dead child, and, falling into a state of syncope, Mr. Rentzsch, Surgeon, was sent for. He saw immediately that the case was hopeless, and the patient died in about twenty minutes after the

birth. Great hæmorrhage, described by Mr. Rentzsch as a highly dangerous symptom, requiring most cautious treatment, had preceded the birth several hours, but of which it appeared the midwife had taken no notice. The jury, after some deliberation, returned a verdict of manslaughter against Ann Young, and she was thereupon committed by the coroner for trial at the next assizes.

VOCALIZATION.—In the pronunciation of vowels the palate was raised, and retained its position as long as the sound was kept up; this movement was least marked for the letter *a*; the palate not even reaching the horizontal. In the pronunciation of the other vowels it passed the horizontal, most for the *i*, less for *u*, and still less for *o* and *e*. During the pronunciation of *i*, *u*, *o*, *eu*, and *e*, the occlusion of the pharynx is complete, for when water was then injected into nose it did not pass downwards into larynx or lower part of pharynx; but with the letter *a* water was not so retained. The results obtained in the pronunciation of consonants were unsatisfactory; this much, however, was certain, that with the exception of *m* and *n*, all the sounds of the German language are accompanied with an elevation of the palate. The tension of the palate increases with its elevation. These facts show how it is, that after staphyloraphy, the pronunciation does not always become clear; the tension of the palate is too great to permit it to be properly elevated. The extent of the movements observed during suction and deglutition renders difficult the explanation of the mechanism by which infants with divided lips and palate perform the act of deglutition. Only a complicated movement of the tongue can supply the defect; one of its borders is introduced into the fissure of the palate, and thus separates the nasal fossæ from the mouth and pharynx.—*Wien. Med. Woch.*

GLASGOW EYE INFIRMARY.—TESTIMONIAL TO DR. MACKENZIE.—It having been resolved to mark the estimation in which the eminent oculist, Dr. Mackenzie, is held for his faithful and gratuitous services in connexion with the Glasgow Eye Infirmary during the period of its existence, an interesting meeting of the directors, subscribers, and other friends was held in the institution recently, on the occasion of a striking and beautifully-finished portrait of Dr. Mackenzie, painted by Mr. Daniel Macnee, being placed in the directors' room. In replying to the address of the Chairman, Dr. Mackenzie said:—"That 31,490 patients have been admitted on our journals since 1824, by which I do not mean that their names merely have been taken down, but their cases minutely gone into and recorded, as well as the treatment prescribed, and the results of that treatment. Upwards of 1740 operations have been performed on the eye, some of them, no doubt, trivial, but the major part serious and important, as involving the preservation or the restoration of sight. The number of students admitted as pupils amounts to 447, who have been the means of carrying the doctrines and practice here followed, not only into different parts of the United Kingdom, but to some of the remotest regions of the globe. According to the allegory of the ancient moralist, the world is a theatre and each man's part in the varied play of life is determined by the poet. We have all of us, sir,—directors, surgeons, students, patients,—been engaged, according to the several parts assigned to us, in acting no fictitious or trifling drama. It remains to be seen at a future day, whether we have acted our parts well; for the judgment of our fellows, while sometimes critically severe, is in other instances much too flattering. Meantime, it is surely not too much to hope and believe, that the best of the past will merge into and sustain the prospects of the future. We may be inclined to flatter ourselves that there can be nothing more suited to do good than some institutions which at present exist, and which are already assuming the venerable air and receiving the reverential regard due to the lapse of many years; but who shall pretend to limit the flood of coming changes, or have so little faith in the efforts of enlightened and earnest men, guided and controlled by Providence, as to suppose that in our charitable establishments for the relief of disease, as in all other human institutions, many and great improvements are not yet to take place? I beg to return my sincerest thanks to the directors for their kindness in placing my portrait on the walls of the Eye Infirmary. I also owe a debt of gratitude to Mr. Macnee, for the great pains he has taken in painting the portrait. Such productions of the pencil superficial observers are apt to regard as the result of

a very artificial or even luxurious, state of society, forgetting the maxim that 'Art is Nature'—forgetting that it is Nature which first called forth such memorials of respect or affection and which bids us regard them with pleasure. It has been well said, that to tell a man that he shall be forgot is one of the heaviest stones that can be thrown at him. How flattering, then, to think that after those eyes which had long and often wearied themselves in examining the pained and lustreless eyes of others, shall themselves have become dim, their semblance shall still, and for a long period to come, beam forth no lifeless expression from the canvas of one so skilled in his beautiful art as our accomplished friend Mr. Macnee."

NATIONAL ASSOCIATION FOR THE PROMOTION OF SOCIAL SCIENCE.—The third annual meeting of this Association was commenced at Bradford on the 10th inst. On Monday, October 10, at half-past three o'clock p.m., there was a special service in the Bradford parish church. At half-past six p.m., the Council of the Association met in their room at St. George's-hall. At half-past seven p.m., a general meeting was held at St. George's-hall. The opening address was delivered by the President of the Association, the Earl of Shaftesbury. Lord Brougham and others took part in the proceedings. Tuesday, October 11, half-past ten a.m. to four p.m.—The President of the Council, Lord Brougham, delivered his annual address. Vice-Chancellor Sir W. Page Wood delivered his address on Jurisprudence. Both these addresses were given in St. George's-hall. The departments then met in their rooms for papers and discussions. The International Association of Coinage, Weights, and Measures, met in the theatre of the Bradford Mechanics' Institute. At half-past seven p.m., a *soirée* for members and associates at St. George's-hall; rooms were appropriated for conversational meetings on special subjects. Wednesday, October 12.—At half-past ten a.m., the Right Hon. C. B. Adderley, M.P., delivered, in St. George's-hall, his address on Education. Half-past eleven a.m. to four p.m., the departments met in their rooms for papers and discussions. At half-past seven p.m., a meeting of the Bradford Mechanics' Institute was held in St. George's-hall, Lord Brougham presiding. Thursday, October 13.—At half-past ten a.m., Mr. R. Monckton Milnes, M.P., delivered, in St. George's-hall, his address on the Punishment and Prevention of Crime, and the Reformation of Criminals. Half-past seven p.m., a meeting of the working classes in St. George's-hall; the Mayor of Bradford presided. Friday, October 14.—At half-past ten a.m., the Right Hon. W. Cowper, M.P., delivered, in St. George's-hall, his address on Public Health. Half-past eleven a.m. to four p.m., the departments met in their rooms for papers and discussions. At half-past seven p.m., a *soirée* for members and associates in St. George's-hall. This day, Saturday, October 15.—At half-past ten a.m., Sir James Kay Shuttleworth will deliver, in St. George's-hall, his address on Social Economy; after which the concluding meeting of the members and associates will take place, and reports will be received and resolutions passed. Arrangements have been made for excursions to the Low Moor Iron Works and to Saltaire, the great spinning and manufacturing establishments of Mr. Titus Salt, M.P. Other manufacturing and mercantile establishments have been open to members and associates during their stay. The Bradford Exchange News-room, the Bradford Library, the Mechanics' Institute news and reading-rooms, and the Young Men's Christian Association news-room have also been free to members and associates. A large dining-hall has been erected, adjoining St. George's-hall, for the convenience of visitors. In the Public Health Department we find the following programme offered:—W. H. Hudson: On the State of the General Health of the Borough of Bradford, and on some of the Causes which have influenced its Condition. T. Beaumont: Bradford; its Social and Sanitary Progress. W. Macturk, M.D.: On Changes in the Type of Diseases in Bradford. J. Beddoe, M.D.: On the Healthiness of the Anglo-Saxon Race in Australia. W. Macturk, M.D.: On the Increase of Epilepsy in Bradford. W. H. McGowan: The Air we breathe; ought every one to do as he likes with it? J. S. Hammack, F.R.S.: On the Relation between Density of Population and the Mortality from Consumption.

STATE OF THE THAMES.—Dr. Miller says:—"It was remarkable that the organic matter in solution in the river, particularly at high water, was less during August, when

the river was offensive, than in September, when there were no complaints. The chemical methods of discriminating between the injurious and the harmless organic substances when once diffused through water were very imperfect. There was, however, a mode of investigation which hitherto had been comparatively little regarded, but which promised more useful practical results. He found there was a close connection between the quantity of oxygen dissolved in water and its wholesome or offensive qualities as regards organic impurities. In proportion as the oxygen diminished the water became more and more offensive. The injurious matters were the substances in a state of rapid decomposition, in which they are prone to absorb oxygen freely. The grand agent in purifying the water from the organic contaminations of the sewers is the oxygen of the atmosphere. All running water contained a small quantity of atmospheric air in solution. The amount of air thus dissolved varied with the temperature, but it usually ranged between six and seven cubic inches per gallon. In pure well aerated water one-third of this consisted of oxygen and two-thirds of nitrogen. The proportion of oxygen to nitrogen was therefore as 1 was to 2. In addition to atmospheric air, nearly all waters contained carbonic acid; but the proportion of this gas was liable to great variations. In some streams the quantity of carbonic acid was scarcely perceptible, while in others it amounted to twelve or fourteen cubic inches, or even more, per gallon. In many cases a large proportion of this carbonic acid was produced by the slow oxidation of the organic matter in the water at the expense of the oxygen which that water had dissolved. He had made a large number of experiments upon this, and submitted a table of analyses, showing in a striking manner the extent to which this occurred in the Thames. From these experiments it would be seen that the water from Kingston above Teddington was thoroughly aerated, and contained oxygen in the proper proportion to the nitrogen. At Hammersmith the effect of organic impurities in abstracting the oxygen began to be evident. It was much more marked at Somerset-house, while at Greenwich, where the condition of the river at low water is about at the worst, the oxygen nearly disappears. At Woolwich it was nearly as bad, but by the time Erith was reached a great improvement was perceptible. Lower down the proportion of oxygen, owing to the admixture of aerated sea-water, increased, and the absorption of the oxygen, due to the successive exposure of the water to the air on its onward flow. The quantity of carbonic acid increased, while that of the oxygen diminished, the additional amount of carbonic acid being formed from the organic impurities, which were thus converted into new and harmless forms of matter at the expense of the dissolved oxygen. No fish could possibly live in that portion of the Thames at low water between Greenwich and Waterloo Bridge, while it continued in the condition disclosed by the experiments, and this result was due to the absence of oxygen, quite irrespective of other effects that might arise from the action of the sewage products. The proportion of oxygen contained in the water of the river was slowly increasing, evidently because at this reduced temperature the putrescent condition of the organic matter was less rapidly assumed, and its tendency to oxidation had become proportionally diminished. The practical conclusion to be drawn from the experiment was that by determining at intervals the composition of the gases contained in the water of the Thames, indications of the state of the river may be procured which will give timely warning of the period at which the application of deodorising agents would become advisable, though the ordinary methods of analysis furnish no such warning. The experience of the past summer showed that the condition of the river might be controlled by the free use of the deodorising agents applied to the contents of the sewers; and it also indicated the importance of resorting to them at an earlier period than was practised in the present year."

VITAL STATISTICS OF LONDON.

Week ending Saturday, October 8, 1859.

BIRTHS.

Births of Boys, 917; Girls, 840; Total, 1757.
Average of 10 corresponding weeks, 1849-58, 1407.0.

METEOROLOGY.

From Observations at the Greenwich Observatory.

Mean height of barometer	29.836 in.
Mean temperature	62.1
Highest point of thermometer	71.8
Lowest point of thermometer	55.8
Mean dew-point temperature	57.5
General direction of wind	S.E.
Whole amount of rain in the week	0.39
Amount of horizontal movement of air in the week	305 miles.

TO CORRESPONDENTS.

We regret to be obliged to postpone a Clinical Lecture on Ovarian Disease by Dr. SIMPSON, but the proof had not been returned at the hour of going to press.

Mr. Day, Acton.—We shall be obliged by the particulars of the case.

Mr. W. Smith.—The "commencement of professional study" is understood at the College of Surgeons to date from apprenticeship.

Mr. Hogg.—We shall be happy to render any assistance in our power. The testimonial from the Board of Guardians is very gratifying.

J. C. H.—We know nothing of the Rev. Doctor; but our advice is to have nothing to do with any such advertisers. "Humbug" is a mild term for their system.

H. F. A. should apply to Sir John Liddell, Somerset House. Cost of outfit, about £70, which may be easily borrowed from an outfitter or agent, if necessary. There is another examination, by Dr. Bryson.

W. T.—We are assured that the "T. Smethurst, M.D." who wrote the paper alluded to last week, is the Dr. Smethurst now under sentence of death. He and a brother, now a Druggist, were residing together in Beak-street in 1844. We have also good reason to believe that enquiries of a very serious nature are still proceeding.

HOMOEOPATHIC VACCINATION.

TO THE EDITOR OF THE MEDICAL TIMES AND GAZETTE.

SIR,—In a late number you inserted a note from me in reference to Homoeopathic Vaccination in New Zealand. Allow me to add, in justice to the parties concerned, that the Homoeopathic Practitioner only proposed the method of swallowing the virus as an experiment, and did not assert that it would be effectual; on the contrary, he very fairly advised the parents to cause the child to be submitted to the test of re-vaccination.

Whatever then may be thought of the wisdom of this experiment, I must retract anything which seems harsh in my note respecting the author of it.

London, October 10, 1859.

I am, &c.

R. DRUITT.

THE EDINBURGH COLLEGE OF PHYSICIANS.

TO THE EDITOR OF THE MEDICAL TIMES AND GAZETTE.

SIR,—I saw from a letter in last week's paper, that the Edinburgh College of Physicians forbids its M.D.'s to act as Apothecaries, oblige me by letting many of us know if the same law is laid down by Aberdeen and St. Andrew's, as at present many of our neighbours take the higher glories attached to the title of M.D., but do not disdain to dispense and be paid for their own medicines. If this is forbidden by their Bye-laws, I for one, will assist in putting a stop to such a system of humbug and deception.

I am, &c.

M.R.C.S.L., AN OLD SUBSCRIBER.

TO THE EDITOR OF THE MEDICAL TIMES AND GAZETTE.

Royal College of Physicians, Edinburgh, Oct. 10, 1859.

SIR,—The attention of the Council of this College has been directed to a letter, signed by "Iatros," and dated from Durham, which appeared in the *Medical Times and Gazette* of the 1st October, and in which your correspondent stated from personal knowledge, that one of the Licentiates of

this College keeps an open apothecary's shop in a large town in the North of England. The Council trust that "ἰατρός" will communicate to me the name of the individual referred to, with full particulars, in order that such steps as may seem expedient, may be taken in this matter.

I am, &c.

D. R. HALDANE, Hon. Sec.

TO THE EDITOR OF THE MEDICAL TIMES AND GAZETTE.

SIR,—In answer to a query in the last number of your Journal, I am enabled to inform you on the most reliable authority that a full list of the Licentiates of the Royal College of Physicians of Edinburgh will be published in the public journals about the middle of next December, at the same time that the List of its Fellows is, according to usage, annually published.

I am, &c.

JOHN E. SMYTH.

2, China-terrace, Lambeth.

THE TITLE OF DOCTOR.

TO THE EDITOR OF THE MEDICAL TIMES AND GAZETTE.

SIR,—Foreign Degrees (M.D.) obtained without examination (and since the passing of the Medical Act, even though obtained after examination) will not entitle the holder to register as a Medical Practitioner; nor is the degree admitted as a Medical qualification. But cannot a registered Practitioner (say a F.R.C.P. and F.R.C.S.) who, of course, does not require the degree of M.D. to register upon, use an unregistered degree as merely an academical title? Many Fellows of the London College of Physicians hold foreign degrees only. These they continue to use as academical titles, although not registered as Medical qualifications. In doing so are they infringing the Medical Act, or, have registered Medical Practitioners the right to use unregistered Medical titles?

I am, &c.

L.R.C.P. Edin.

Bristol, October 8, 1859.

[We should prefer referring this question to the lawyers and the Medical Council.—Ed.]

THE COLLEGE OF PHYSICIANS.

TO THE EDITOR OF THE MEDICAL TIMES AND GAZETTE.

SIR,—Pray can you inform me what is being done by the Council of the College of Physicians of London, in reference to the annual Election of Fellows? You will remember that the Fellows rejected the list proposed by the Council some months ago, and sent it back to the Council for emendation; directing the Council to report to them again some time in October. I need hardly tell you that many persons are very anxious to know what views the Council will now take in reference to the list of Fellows to be proposed by them to the Council. It is clear, that if the principle, or rather the apparent want of all principle, which presided over the selection of the last list is permitted again to rule in the Council, the Fellows at large will be equally as dissatisfied with the forthcoming as they were with the last list. Surely the Council have had time enough to deliberate upon and bring this important subject of selection of Fellows to a conclusion.

I am, &c.

AN ANXIOUS LICENTIATE.

[In answer to our correspondent we say:—That as far as we can remember, the direction of the Fellows was, that the new list should be presented to them on the 22nd of October. The expression of opinion on the part of the Fellows at large, as to the defects of the former list, was so general, that we cannot doubt for a moment but that the Council will materially alter its character, and alter it in the direction suggested by the Fellows. We believe, however, that the Council have no power to withdraw any of the names which stood on the list presented by them to the College; and therefore that those names must now be balloted for by the Fellows at large. What there is left for the Council to do, is to enlarge considerably the list—to add to it the names of the many highly-distinguished and estimable men who were passed over on the last occasion. We cannot doubt that this will be the course pursued by the Council; for it is evident that in this matter they can have no other desire, than that of meeting the wishes of the Fellows at large, and of raising the honour of the College, and extending its influence and power, by admitting all Physicians to the Fellowship who have distinct claims to the honour.—Ed.]

THE EDINBURGH LICENTIATESHIP.

TO THE EDITOR OF THE MEDICAL TIMES AND GAZETTE.

SIR,—From the reports and observations in your Journal it is fair to conclude that the College could not at all defend their sale of this article now deemed contraband like its antecedents of Erlangen and Giessen, although the latter did confer the Doctorship on the same facile principle as the celebrated Rabelais was said to purchase it for his favourite horse. I was sorry to see so many of my respectable confrères snatch at this gilded toy at any price, hugging themselves in the idea of being made Doctors, and elevated by new address cards, new door-plates, and the sagacious intimations of kind friends to the parallel of Doctors *par excellence*. I can imagine how many of these gentlemen may be somewhat put to chagrin at finding they cannot register as Doctors, and that so many by continuing to dispense their own medicines have violated the conditions under which they have obtained the aforesaid Licentiateship. I respect the three ordinary classes of the Profession as established by usage, and perhaps necessity—the M.D. by education, the Surgeon after the same principle, and the Licentiate of the Apothecaries; and now, sir, I beg leave to ask you and the Profession at large, are we to recognise these irregular claimants of Medical title in the way they wish and are recognised by a portion of the public ignorant of particulars? I meet, for instance, some of these men who are my neighbours at a social gathering, and I may have to address a letter to such an individual, but however unpleasant it may be to myself or to my neighbour that I do not recognise him in his new and self-appropriated appellation I conceive the duty I owe to the legitimate grades of my Profession calls upon me not to concede his claim. I am anxious, therefore, to know how far you and the Profession are willing to bear me out in such a matter, for if men of my opinion numerously join in such a repudiation, we shall not only have numbers on our side, but the Medical Council and the Colleges. I would just make a further remark: what can any Licentiate-

ship give besides a licence to practise Medicine or Surgery as it may be, and in this sense the Licentiateship of a College of Physicians does not confer a Doctorship any more than that of a College of Surgeons, or the Licentiateship of the Apothecaries.

I am, &c.

THOMAS STOKES.

Nailsworth, October 8, 1859.

THE NAVAL MEDICAL SERVICE.

TO THE EDITOR OF THE MEDICAL TIMES AND GAZETTE.

SIR,—It is very desirable that all those Members of the Medical Profession, who, having just completed their studies, entertain any idea of joining the Royal Navy, should not be misled by the Royal Warrant of the 13th of May last, which is circulated with the curriculum issued from Somerset-house. Any stranger on reading that Warrant would say, that the pay, position, and future prospects held out to a Surgeon entering on his career, were such as to render an appointment in the Navy desirable. He would take it for granted that the terms of the Warrant were carried out, and would not learn his mistake till too late. Scarcely any of its provisions are acted on.

The present Board of Admiralty have taken every opportunity to show their determination not to comply with its terms; and in a circular issued during the last week, regulating the rates of travelling expenses to be paid to officers, the Medical officers occupy their old position—the Surgeons (ranking by the Warrant with Majors or Lieutenant-Colonels) being paid on the same scale as Engineers and Naval instructors, both their juniors in rank two grades; while the Assistant-Surgeon is paid at the same rate as a Naval Cadet, fourteen years of age, and one shilling and sixpence more than the boatswain or carpenter of the ship.

They have shown it by refusing to make any alteration in the uniform, so that Medical officers are now obliged to wear the same as they have always worn, which is that of officers much their juniors in rank.

They have refused to pay to the widow of a Surgeon recently deceased, the pension according to the terms of the Warrant; and they also have refused to act up to the article referring to forage, allowances, etc.

Any one entering the service now as an Assistant-Surgeon, takes a position much inferior to that of his fellow-student who goes into the Army. The only benefit the Naval Medical officers have as yet derived from the Warrant, has been an increase of pay. This, it is to be hoped, the Admiralty cannot deprive them of—most surely if they can they will.

Apologizing for the length of this communication, which I hope you will be able to insert,

I am, &c.

R. N.

[We trust these difficulties will be got over, and that, however unwilling, the Admiralty will be compelled to carry out the Warrant.—Ed.]

COMMUNICATIONS have been received from:—

PROFESSOR SIMPSON; DR. GEORGE JOHNSON; DR. BRYCE; DR. COOTE; MR. DAY; DR. ADAMS, Aberdeen; DR. BARKER, Bedford; MR. HARRISS; MR. HOOK; MR. GARDNER.

APPOINTMENTS FOR THE WEEK.

October 15. Saturday (this day).

Operations at St. Bartholomew's, 1½ p.m.; St. Thomas's, 1 p.m. King's, 2 p.m.; Charing-Cross, 1 p.m.

17. Monday.

Operations at the Royal Free Hospital, 1 p.m.; Metropolitan Free Hospital, 2 p.m.

MEDICAL SOCIETY OF LONDON, 8 p.m. Dr. Thudichum "On the Pathology and Treatment of Gall Stones."

18. Tuesday.

Operations at Guy's, 1 p.m.; Westminster, 2 p.m.

PATHOLOGICAL SOCIETY, 8 p.m. (Council Meeting, 7 p.m.) First Meeting.

19. Wednesday.

Operations at University College Hospital, 2 p.m.; St. Mary's, 1 p.m. Orthopædic Hospital, 2 p.m.; Middlesex, 1½ p.m.

HUNTERIAN SOCIETY, 8 p.m.

20. Thursday.

Operations at St. George's, 1 p.m.; Central London Ophthalmic, 1 p.m. London, 1½ p.m.; Great Northern, 2½ p.m.

HARVEIAN SOCIETY OF LONDON, 8 p.m. Introductory Address, by Dr. Hart Vinen, F.L.S.

21. Friday.

Operations, Westminster Ophthalmic, 1½ p.m.

EXPECTED OPERATIONS.

King's College Hospital.—The following operations will be performed this day (Saturday):—

Mr. Fergusson—Amputation at Knee-Joint; Necrosis of Tibia; Ditto of Scapula; Division of Hamstring Tendons; For Dislocation of Elbow; Removal of Growth from Lip.

Apothecaries' Hall, London.—Notice

TO STUDENTS.

The next PRELIMINARY EXAMINATION in CLASSICS and MATHEMATICS will be held at the HALL on Tuesday, the 15th November next, at Eleven o'clock, and on Wednesday the 16th.

Medical Students cannot be admitted to this Examination before the commencement of their Apprenticeship, a Certificate of which will be required, but at any period from that date to the commencement of the Second Winter Session of their Curriculum.

This Examination is compulsory to all gentlemen who commenced their Apprenticeship after August 1, 1858.

The subjects will be—

In Greek—The Gospel of St. John.

Third Book of Homer's Iliad.

In Latin—Cicero, Pro Lege Manilia.

Horace, Third Book of the Odes.

Mathematical—The First Book of Euclid's Elements, Arithmetic and Algebra, to Simple Equations, involving two unknown quantities.

Students wishing to attend are requested to send their name and address to Mr. Rivers, Beadle's Office, at this Hall, at the latest one Calendar Month previous to the day of Examination.

ALFRED M. RANDALL,

October, 1859.

Secretary to the Court of Examiners.

Royal College of Surgeons of

ENGLAND.—Notice is hereby given that the Professional Examination for the Fellowship of this College will be held on Tuesday and Thursday, the 15th and 17th of November next.

That the Primary or Anatomical Examination for the Diploma of Member of this College, will be held on Tuesday, the 22nd of November next, and following days.

And that the Surgical or Pass Examination for the Diploma of Member will be held on Tuesday, the 29th November next, and following days.

Particulars relating to these Examinations may be obtained on application at the College.

October 10, 1859.

EDMUND BELFOUR, Secretary.

Royal College of Surgeons.—The

following are the days appointed for the Preliminary Examination in Classics, Mathematics, and French of Candidates for the Fellowship of this College, viz., Thursday, Friday, and Saturday, the 20th, 21st, and 22nd, inst. Further information upon the subject may be obtained upon application at the College.

EDMUND BELFOUR, Secretary.

The London School of Dental Surgery,

32, SOHO-SQUARE.

This School has been organised in conformity with the requirements of the Charter granted by the Royal College of Surgeons of England, empowering that Corporation to conduct Examinations, and to grant Diplomas of Proficiency in Dental Surgery.

The Lectures upon the subjects specially pertaining to Dental Surgery will be given during the Summer Medical Session, in order that Students may be at liberty to attend at any of the existing Medical Schools those Lectures enjoined by the Curriculum upon subjects which are not peculiar to Dental Surgery.

The Hospital is now open for the reception of pupils, who will receive instruction daily under the superintendence of the Dental Officers.

DENTAL HOSPITAL ATTENDANCE.

9 a.m.—Monday—W. A. Harrison, Esq., F.R.C.S.

11 a.m.—Tuesday—Samuel Cartwright, Esq., jun., M.R.C.S.

11 a.m.—Wednesday—John Tomes, Esq., F.R.S., M.R.C.S.

11 a.m.—Thursday—Thomas Underwood, Esq.

11 a.m.—Friday—Charles Rogers, Esq.

11 a.m.—Saturday—Robert Hepburn, Esq.

Fee for Two Years' attendance, £15 15s.

The following are the Special Lectures:—

Dental Anatomy and Physiology (Human and Comparative)—G. A. Ibbetson, Esq., F.R.C.S., F.G.S.

Dental Surgery and Pathology—Samuel Cartwright, Esq., jun., M.R.C.S.

Mechanical Dentistry, with Practical Illustrations—R. Hepburn, Esq.

Metallurgy—G. Makins, Esq.

General Fee—Two Courses of Dental Anatomy, Dental Surgery, Mechanical Dentistry, and Metallurgy, £15 15s.

Further particulars respecting the arrangements of the School may be obtained by application to the Assistant-Secretary of the Dental Hospital, 32, Soho-square.

Harveian Society of London, Stafford-

ROOMS, TITCHBORNE-STREET, EDGEWARE-ROAD.

Notice is hereby given, that the First Meeting of the Session of this Society for 1859-60 will be held in the New Rooms, on Thursday, October 23, at 8 p.m., when the INTRODUCTORY ADDRESS will be delivered by the President, Dr. HART VINEN, F.L.S.

WEEDEN COOKE, } Hon. Secs.
H. C. STEWART, }

The Queen's University in Ireland.—

QUEEN'S COLLEGE, BELFAST.—FACULTY OF MEDICINE.

The Session for 1859-60 will commence on the 18th of October, and the Matriculation Examination will be held on the 20th of October, and on the 8th and 24th of November.

Six Junior Scholarships of £20 each, and two Senior Scholarships of £40 each, are awarded annually.

Scholars are exempted from one-half of the Class Fees.

The College Fee is 5s.

For further information, see Belfast Queen's College Calendar for 1859, or apply to the Registrar.

By Order of the President,

RICHARD OULTON, Registrar.

Anatomy. — Dr. John Struthers,

F.R.C.S. will RESUME his COURSES of ANATOMY at SURGEONS' HALL, on November 3rd. Lectures: Systematic Anatomy, at Two o'clock. Demonstrations: Regional Anatomy, at Four o'clock. Practical Anatomy: Dissections, with Superintendence and Instructions, from Nine a.m. till Four p.m. These Courses qualify for the Royal Colleges of Physicians and Surgeons, University of Edinburgh, and the other Public Boards.

Edinburgh, October, 1859.

Scammony Manufactured from the

ROOT.—This Pure Resin may be had of all Wholesale Druggists at 25 per cent. under the price of the best Virgin Scammony.

And the superiority of its quality was fully explained at a meeting of the Pharmaceutical Society, and reported at length in their Journal of March last, from which the following are extracts:—

"From these numerous observations, one hundred and twenty in number, together with many others which have not been tabulated, I am quite convinced that the scammony prepared by the new process from the untapped root is quite equal, as a remedy, to the very best virgin scammony which is met with in commerce, and equal, in fact, to the resin which is extracted from commercial scammony by means of ether; and it possesses this most important advantage over the scammony of commerce, namely, of being entirely free from the frauds which are almost constantly practised upon it in the country where the plant grows, and in which it has hitherto been collected, and, therefore, being perfectly uniform in its physical characters, composition and therapeutic action. There can, therefore, be no objection, but, on the other hand, manifest advantage, in employing it in place of the scammony commonly met with.

"A. B. GARROD, M.D., F.R.S., F.R.C.P.

"Professor of Materia Medica, Therapeutics and Clinical Medicine at University College; Physician to University College Hospital."

"I have endeavoured to ascertain the relative activity of Messrs. M'Andrew's scammony, and of a fine specimen of commercial virgin scammony, by prescribing these drugs alternately in equal doses to the same patient. The results, according to the judgment of myself and others who have assisted me in watching the cases, is that in most instances Messrs. M'Andrew's scammony has proved itself decidedly more active than the virgin scammony. As to pleasantness of operation, or the reverse, there seemed to be no choice between the two specimens.

"That a preparation of scammony should be a little more, or a little less active is of comparatively small importance. It is far more important that the drug should have a fixed and uniform composition and activity, so that the prescriber may know, with an approach to certainty, what doses are required to produce a given effect. This advantage of uniform activity Messrs. M'Andrew's scammony seems likely to possess over the scammony which has hitherto been in common use, and which is a drug notoriously of most uncertain composition and power.

"GEORGE JOHNSON, M.D., F.R.C.P.

"Professor of Materia Medica and Therapeutics in King's College; Physician to King's College Hospital."

Crosse and Blackwell, Purveyors in

Ordinary to Her Majesty, respectfully invite attention to their PICKLES, Sauces, Tart Fruits, and other table delicacies, the whole of which are prepared with the most scrupulous attention to wholesomeness and purity. The practice of colouring pickles and tart-fruits by artificial means has been discontinued, and the whole of their manufactures are so prepared that they are not allowed to come in contact with any deleterious ingredient. A few of the articles most highly recommended are, Pickles and Tart Fruits of every description, Royal Table Sauce, Essence of Shrimps, Soho Sauce, Essence of Anchovies, Jams, Jellies, Orange Marmalade, Anchovy and Bloater Pastes, Strasbourg and other Potted Meats, and Calf's-Foot Jellies of various kinds for table use. C. and B. are also sole agents for M. Soyer's Sauces, Relish, and Aromatic Mustard; and for Carstairs' Sir Robert Peel's Sauce, and Payne's Royal Osborne Sauce. The above may be obtained of most respectable Sauce Vendors throughout the United Kingdom; and Wholesale of

CROSSE and BLACKWELL, 21, Soho-square.

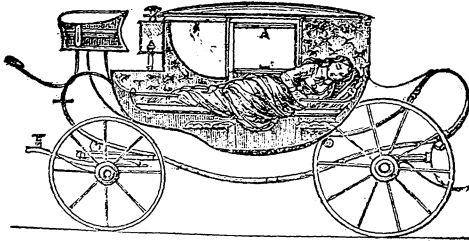

Health, Fresh Air, and Pure Water.

—By Her Majesty's Letters Patent.—CONDY'S FLUID contains NASCENT OXYGEN, *nature's true and only purifying agent*; instantly removes all offensive smells; renders impure water fresh, and the air pure; when diluted for use, is of a beautiful colour, not soiling the finest linen; is harmless, and particularly adapted for toilet use, being both refreshing and exhilarating. The Medical Profession have expressed their unqualified approbation of its merits. One gallon makes 200 gallons adapted for use. The cooling, healing, gently stimulating and invigorating properties of this Fluid render it, when diluted, a lotion possessing peculiar and valuable characteristics, whether for bathing the bodies of invalids, incorporating in poultices, or washing and healing wounds. Patronised by the Board of Health, and most public departments, hospitals, schools, and adopted by the India Council in preference to all other disinfectants. In bottles, 6d. 1s. and 2s.; stronger and purer, 1s. 2s. and 4s.

CONDY'S PATENT HEALTH POWDER also contains NASCENT OXYGEN, is odourless, and destroys all smells; in bottles, 1s. 6d. and 3s., and in casks of 1 cwt. 36s.—Wholesale agents, John Bell and Co. chemists, No. 338, Oxford-st. W.; Butler and Crisp, 5, Cheapside, St. Paul's; Ferris and Co., Bristol.—Chemical Works, Battersea, S.W.

Microscopic Glass.—Thin Glass for

Mounting Objects, in squares or circles. Slides 3 in. by 1 in., and Cells of every kind, supplied Wholesale and Retail, by CLAUDET and HOUGHTON, 89, High Holborn, London.

IMPROVED INVALID COT CARRIAGES,

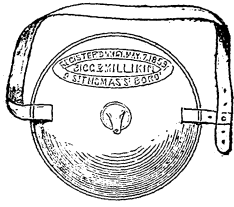

THE GREATEST LUXURY AND COMFORT EVER INTRODUCED FOR REMOVING INVALIDS, BEING FITTED UP WITH THE PATENT NOISELESS WHEELS.

These Carriages may be engaged, on moderate terms, for any journey, on application to

H. & J. READING,

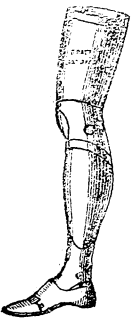

COACHBUILDERS, 14, RIDING-HOUSE-STREET, CAVENTISH-SQUARE.

Also a good assortment of New and Second-hand Broughams and other Carriages for Sale or Hire.

Registered No. 4171,

May 7th, 1859, by BIGG & MILLIKIN, 9, St. Thomas-street, Borough, MADAME HARRIOTE'S MAMMARY FEEDING BOTTLE, or Artificial Breast, by which an infant can receive its food in the most natural position, and be deceived by its pliable and soft texture. It has many advantages that none but a mother can appreciate.—To be had only at BIGG & MILLIKIN'S, Instrument Makers to Guy's and St. Thomas's Hospitals, 9, St. Thomas-street, Borough.

Pratt's Artificial Leg.

J. PRATT begs to call the attention of the Profession to the following Testimonial, just received:—

"Somerset,

June 20th, 1858.

"DEAR SIR,—It affords me much pleasure in being able to state that the Artificial Leg which you supplied me with is far beyond my best anticipations. From its being so LIGHT IN WEIGHT, and its action in the foot so natural, I can walk, or ride on horseback, with ease and comfort; and few indeed would detect it as being other than natural. It has given me full satisfaction.

I am, dear Sir, yours very truly, J. W.

To Mr. J. Pratt,
Surgical Instrument Maker,
420, Oxford-street."

Professors of Anatomy and STUDENTS

are invited to inspect the Stock of Skeletons, Skulls, separated and entire—Vertebrae, Hands and Feet on catgut, and various loose bones, which are well prepared, perfectly white, and free from grease or smell. The selection of this stock having been made by a good Anatomist, W. M. can confidently recommend them as being well marked, perfect bones, at low prices.

W. MATTHEWS, 8, Portugal-street, Lincoln's-inn-fields, London.

Brown & Polson's Patent Corn Flour,

preferred to the best Arrowroot. DELICIOUS in PUDDINGS, CUSTARDS BLANC-MANGE, CAKE, &c., and especially suited to the delicacy of CHILDREN and INVALIDS.

The Lancet states—"This is superior to anything of the kind known."

Trade Mark and Recipes, on each Packet, 4, 8, and 16 oz.

Obtain it from Family Grocers, Chemists, &c.

77A, Market-street, Manchester; and 23, Ironmonger-lane, London.

Struve's Seltzer, Marienbad, Vichy,

KISSINGEN, and other MINERAL WATERS.—Under her Majesty's special Patronage.—ROYAL GERMAN SPA, BRIGHTON, STRUVE'S PUMP-ROOM and PROMENADES, offering every facility for a Course of Mineral Waters, as perfect and beneficial as at the natural springs, are NOW OPEN, for the Thirty-fifth Season. A prospectus, with the highest Medical testimonials, may be obtained gratis, at the Pump-room, or from George Waugh and Co. Chemists to the Queen, 177, Regent-street (westside), London, and other respectable houses in London and the provincial towns, where orders for Struve's Bottled Mineral Waters continue to be executed.

CAUTION.—The success obtained by Struve's Mineral Waters, owing to their perfect identity with those of the natural springs, has induced several parties to attempt imitations, sold as "Brighton Seltzer," "Brighton Vichy," &c., an analysis of some of which has shown an utter disregard of their true chemical composition. To distinguish Struve's Waters from all others, every bottle has a label and red ink stamp over the cork, each bearing Struve's name, without which name none is genuine, though contained in Struve's old bottles.

PURE SPIRITS FOR THE FACULTY.

S. V. R. 56 o.p., 16s. 6d. net Cash.—

This quotation admits of neither credit nor discount, and 1s. per gallon must be added for packages, to be allowed on their return.

HENRY BRETT and CO., Old Furnival's Distillery, Holborn.

Human Osteology from France,

RAGINEL, 38, Ludgate-hill, City, E.C., London. Patronised by the Royal College of Surgeons of England. Illustrated Osteology on the bones themselves. Very large Stock on the lowest possible terms. Disarticulated Skulls, in twenty-two pieces, in box. All the bones of the disarticulated skulls will be fitted in right order in the presence of the purchaser so as to shew that every bone of each set belongs to the same Skull; it will be the same for all other disarticulated pieces. Skulls with Sections. Hands and Feet on catgut. Disarticulated Skeletons, quite complete, with the Skull same body. Articulated Male Skeletons, the bones very well marked. STUDENT'S CASE OF OSTEOLOGY, COMPLETE.

Splendid Pieces for Lecturers and Museums.

J. & E. BRADSHAW, late

Shoolbred and Bradshaw,

34, JERMYN-STREET,

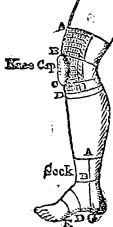

begs to call attention to the various improvements in Patent ELASTIC STOCKINGS, BELTS, KNEE-CAPS, SOCKS, and Ladies' and Gentlemen's SPINE SUPPORTERS. A new description of BELT, invaluable for prevention of Cholera and the cure of Rheumatism, Lumbago, &c.

N.B. Every description of INDIA-RUBBER BANDAGE, vulcanised on the newest principle.

Directions for measurement sent by post.

N.B. A Liberal Discount to the Profession.

A Female to attend on Ladies.

Or SACCHARATED CAPSULES.—Copaiba and Cubebs are, doubtless, the best remedies, but these drugs are of a repulsive taste and odour, and occasion colicky pains, nausea, and gastric disturbance. M. JOZEAU has succeeded in rendering these valuable therapeutic agents perfectly innocuous, by increasing, in his Copahine, all the curative properties. This preparation has been adopted by the Paris Academy of Medicine, after more than a thousand trials in Paris, and the different London Hospitals, viz., St. Thomas's, Guy's, and St. Bartholomew's, under the care of Messrs. Lloyd, Poland, and Le Gros Clark. "Lancet," Nov. 6, and Dec. 10, 1852. The Copahine, which is in form of a pretty pink sugar-plum, effects a cure in about six days, either in recent or chronic diseases. 100 Capsules, 4s. 6d., at G. JOZEAU'S, French Chemist, 49, Haymarket, London; 22, Rue St. Quentin, Paris; and all the most important Chemists.

Superphosphate of Iron and Super-

PHOSPHATE of IRON and LIME. New Remedial Agents introduced to the notice of the Profession at the Meetings of the Medical Society of London, and now extensively employed by the most eminent members of the Medical Profession. The Syrup is the most eligible mode of administering these valuable Remedial Agents. MR. GREENISH will be happy to forward a variety of cases which have been furnished to him, where its success has been most marked, and which will serve to indicate where it may be most advantageously employed.—20, New-street, Dorset-square.

Great Saving in the Purchase of New

MEDICAL GLASS BOTTLES and PHIALS at the NORTH LONDON GLASS BOTTLE WORKS, ISAACS and SON (Proprietors).—London Warehouses, 24 and 25, Francis-st., Tottenham court-road, W.C. 6 and 8 oz., any shape, plain, or graduated } clear { 8s. per gross. 3 and 4 oz. ditto ditto } blue tinted { 7s. 6d. do. 1/2 oz. Moulded Phials } of a very { 4s. 6d. do. 1 oz. ditto } superior { 5s. 6d. do. 1 1/2 oz. ditto } quality. { 6s. 0d. do. 2 oz. ditto } { 7s. 0d. do.

A remittance not required till the goods are received. Packages free. Delivered free within seven miles. Post-office Orders payable to "S. Isaacs and Son," at Tottenham-court-road. Bankers: Unity Bank.

Varicose Veins and Supporting Bands.

—SURGICAL ELASTIC STOCKINGS AND KNEE CAPS, previous, light in texture, and inexpensive, yielding an efficient and unvarying support, without the trouble of lacing. Likewise, a strong low-priced article for Hospitals and the Working-Classes. ABDOMINAL SUPPORTING BANDS for both Sexes; those for Ladies' use, before and after accouchement, are admirably adapted for giving adequate support with extreme lightness—a point little attended to in the comparatively clumsy contrivances and fabrics hitherto employed. Instruction for measurement and prices on application, and the articles sent by post from the Manufacturers and Inventors, POPE and PLANTE, 4, Waterloo-place, Pall-mall, London, S.W.

The Profession, Trade, and Hospitals, supplied.

NEPENTHE, OR ANODYNE TINCTURE

(OBTAINED EXCLUSIVELY FROM OPIUM),

PREPARED AT THE LABORATORY OF FERRIS, TOWNSEND, LAMOTTE, & BOORNE,
MANUFACTURING CHEMISTS AND WHOLESALE DRUGGISTS, BRISTOL.

This preparation has now been for many years extensively used by a large number of eminent members of the Medical Profession with the greatest success. It does not produce headache, stupor, giddiness, prostration of strength, constipation, or the usual unpleasant symptoms attending the use of other preparations of opium.

Nepenthe has frequently been found of essential service in cases of Cancer, where every other opiate has failed.

The following Testimonials received from Medical gentlemen in extensive practice will be regarded as satisfactory proof of its efficacy:—

MEDICAL TESTIMONIALS.

"Having prescribed your 'Anodyne Tincture' in many cases, I would strongly recommend its more general adoption. It is especially useful in the wakefulness common after parturition, or other unusual exertion or excitement. It produces a refreshing sleep, and I do not remember any case in which it has caused the objectionable effects of the other opiate preparations."

"8, Wellington-street, London-bridge, August 14, 1856.

"SAML. GRIFFITH, M.D. London, M.R.C.P.

Consulting Physician-Accoucheur to the Farringdon Dispensary,
Physician-Accoucheur to St. Thomas's Hospital, &c."

"Ipswich, March, 1859.

"Gentlemen,—I have great satisfaction in bearing testimony to the value of your 'Nepenthe,' in relieving suffering from disease, and in procuring sleep where ordinary narcotics fail or disagree. For several months I have found it very effectual in relieving a great sufferer when all the ordinary anodynes had ceased to benefit, and although the dose has not been increased for months, the relief is as complete.

"'Nepenthe' is a very valuable addition to our means of relief, and the Profession and the public are greatly your debtors for it.

"I am, Gentlemen, yours obediently,

"EDWD. BECK, M.D. Cantab.
Physician to the East Suffolk and Ipswich Hospital."

"Portland-place, Reading, Nov. 21, 1856.

"To Messrs. Ferris & Co.

"Gentlemen,—'Nepenthe' has, for some time, been a favourite narcotic with me, and I infinitely prefer it to any preparation of opium now extant. It has proved a remedy of great value in all cases of Neuralgia, Chronic Rheumatism, Hypochondriacism, and indeed all affections where the use of a sedative is indicated; and in Delirium Tremens it is certainly invaluable, performing its operation upon the system, without leaving those distressing feelings consequent upon the use of opiates in general.

"I remain, Gentlemen, your obedient Servant,

"WILL. WOOD BRADSHAW, M.D. M.R.C.P. & F.R.C.S. Lond. &c. &c. &c."

Extract of a Letter from the late G. W. CAINES, Esq. M.R.C.S.

"Please to send me some 'Nepenthe,' as I have a patient with cancer in the breast, with whom no other preparation of opium agrees. I have tried them all."

"Uffculme (Devon), Feb. 16, 1854.

NEPENTHE may be procured direct from Messrs. FERRIS and CO., 4 and 5, Union-street, Bristol; from respectable Dispensing Chemists throughout the Kingdom; and from the following Agents:—

LONDON:—Mr. Thos. Keating, 79, St. Paul's-churchyard; Messrs. Evans, Lescher, and Evans, 60, Bartholomew-close; Messrs. Savory and Moore, 143, New Bond-street; Messrs. J. Bell and Co., 338, Oxford-st.

MANCHESTER:—Mr. James Woolley.

LIVERPOOL:—Messrs. Clay and Abraham; Messrs. Evans, Son, and Co.; Messrs. Clay, Dod, and Case.

BIRMINGHAM:—Messrs. Southall Bros. and Co.

YORK:—Messrs. Butterfield, Clarke and Co.

NORWICH:—Messrs. Smith and Sons.

PLYMOUTH:—Messrs. Balkwill and Co.

EXETER:—Mr. Geo. Cooper; Messrs. A. Evans and Co.

EDINBURGH:—Messrs. Raimes and Co.

As many imitations of Nepenthe have been attempted, the signature of FERRIS and COMPANY is placed over the cork of every bottle of the true preparation; and none purchased without this protection can be depended upon.

WALTERS' INDIA-RUBBER URINALS.

F. WALTERS having originally invented these Urinals, begs to warn the Profession of the many bad and useless imitations which are now sold, and he would advise them, before purchasing, to look that they are stamped with his name; as, unless that be the case, he cannot guarantee them.

These conveniences are made for those who require them only occasionally, during a long journey, as well as for those invalids who use them always. MR. WALTERS has much improved them by making them of *Etherised India-Rubber*, which adds very greatly to the strength of the India-Rubber, at the same time that it prevents its sticking together; by this means he is enabled to make them less stiff and harsh than hitherto, and yet to retain all the advantages of that stiffness. There is a patent valve, which prevents the return of the fluid; and they may be worn either sitting, walking, or lying, without the slightest inconvenience, and without being perceived by any one.

WALTERS' CONVENIENCES FOR LADIES will be found particularly useful during pregnancy. They are perfectly soft and flexible, and may be worn with perfect comfort.

All Orders must be accompanied by a Post-office order or reference.—Entrance for Ladies at the private door, where a Female attends.

MANUFACTURER OF ELASTIC STOCKINGS, BELTS, &c.

16, MOORGATE STREET, NEAR THE BANK, LONDON. E.C.

DR. DE JONGH'S

(Knight of the Order of Leopold of Belgium)

LIGHT-BROWN COD-LIVER OIL.

OPINION OF

EDWIN LANKESTER, Esq., M.D., LL.D., F.R.S.,

Late Lecturer on the Practice of Physic at St. George's Medical School, Superintendent of the Food Collection at the South Kensington Museum, &c. &c.

"I have much pleasure in bearing testimony to the excellent qualities of the Cod-liver Oil prepared under the superintendence of Dr. DE JONGH, of the Hague.

"I believe that the purity and genuineness of this Oil are secured in its preparation by the personal attention of so good a Chemist and intelligent a Physician as Dr. DE JONGH. He was the first Chemist who gave an accurate analysis of the Cod-liver Oil, and the discoverer of an organic substance which it contains.

He has also written the best Medical treatise on the Oil with which I am acquainted. Hence I should deem the Cod-liver Oil sold under his guarantee to be preferable to any other kind as regard genuineness and medicinal efficacy.—S, Savile-row, W., August 1st, 1859."

SOLE CONSIGNEES AND AGENTS,

ANSAR, HARFORD, & CO., 77, Strand, London, W.C.

MEDICAL AGENCY.

NOTICE OF REMOVAL AND CHANGE OF FIRM.

Mr. Lara (for the last eight years the sole representative of LANE and LARA, Medical Agents and Arbitrators and Lunatic Asylum Registrars,) begs to inform the Profession that, in consequence of the daily increasing support with which he has been favoured, and for which he tenders his sincerest thanks and acknowledgments, he has taken into PARTNERSHIP Mr. James Maxfield Walters, a gentleman who has had considerable experience in the business. It will, therefore, from and after Christmas, 1858, be carried on, under the Firm of LARA and WALTERS, at 6, PUMP-COURT, Middle Temple, E.C., whither they have removed their Offices from 22, Buckingham-street, Adelphi, in order to provide that larger accommodation which a constant intercourse with a great majority of the entire body of General Practitioners in England has rendered necessary.

Partnerships and Practices sold and valued: Asylums transferred: Arbitrations effected: Assistants provided (if for a permanence without charge to Employers): and every other description of business transacted for the Profession at a fixed and moderate cost. Attendance from 11 till 4.

Hospital for Sick Children, 49, Great ORMOND-STREET.—A SERIES OF LECTURES on the DISEASES OF CHILDREN will be given every SATURDAY during the months of NOVEMBER, DECEMBER, and JANUARY, by Dr. WEST, Dr. JENNER, and Mr. ATHOL JOHNSON, the Physicians and Surgeon of the Hospital.

The First Lecture will be given on SATURDAY, NOVEMBER 12, at 3 p.m., by Dr. WEST.

The Lectures are open to Practitioners of Medicine, and to Students after their first year, on written application, addressed to the Secretary at the Hospital.

By order of the Committee of Management,
H. A. BATHURST, Hon. Secretary.

The London Medical Registration

ASSOCIATION.—The ANNUAL MEETING of this Association will be held at the FREEMASONS' TAVERN, Great Queen-street, Lincoln's-inn-fields, on Thursday, November 3rd, 1859, at 3 o'clock, p.m., the President in the chair. All Members of the Association are earnestly invited to attend.

THEODORE E. LADD, M.D., Hon. Sec.

Surgeons' Hall, Edinburgh.

WINTER SESSION 1859-60.

The INTRODUCTORY ADDRESS will be delivered by Dr. SKAE on November 2, at 2 p.m. The prospectus may be obtained on application to Dr. John Struthers, Secretary to the Medical and Surgical School.

Evening Demonstrations of Anatomy.

—Mr. CHRISTOPHER HEATH, Demonstrator of Anatomy at the Westminster Hospital, will resume his Evening Course of DEMONSTRATIONS and EXAMINATIONS upon the DISSECTED SUBJECT on Wednesday, the 5th of October. The Demonstrations take place on Monday, Wednesday, and Friday evenings, during the Winter Session, from Seven to Nine o'clock, at the Westminster Hospital. Entrance Fee perpetual) Five Guineas.

The Queen's Hospital, Birmingham.—

A VACANCY has occurred in the Office of RESIDENT MEDICAL OFFICER. He is provided with Board, Lodging, and Washing, and receives a Salary of £75 per annum, with an annual increase of £5 the first year, and £10 the second and third year, to £100. The Candidates, who must be Members of the Royal College of Surgeons, and Licentiates of the Apothecaries' Company, are requested to send in their testimonials of qualification to the Secretary, on or before the first of November next. The Candidates whose qualifications are not approved will be informed thereof immediately after the 7th of November, whilst those from whom the Committee of Council wish to make the selection will be invited to attend a meeting for that purpose, at their own expense, of which information will be sent to them. The Surgeon elected will be required to enter on the office on the 1st of December next, and to engage for three years.

DAVID MALINS, Jun., Secretary.

West Herts Infirmary, Hemel

HEMPSTED, HERTS.—Wanted, a HOUSE-SURGEON. Salary, £100 per annum, with Furnished Apartments, Coals, and Candles. Candidates are requested to send in their Testimonials to the Rev. H. Lister, Secretary to the Infirmary, on or before Thursday, the 20th inst. The Election will take place on the 27th of October at One o'clock p.m.

Medical Partnership.—Wanted, to

PURCHASE by a Fellow of the College, &c., &c., married, of gentlemanly address and manners, and of considerable experience in his Profession, a Small Share in a GOOD PRACTICE, in the Suburbs, or within twenty miles of London, or at a good Watering-place. The advertiser feels by his connexion, perseverance, and attention, he would be able to increase any Practice. Address P. P., care of Messrs. Gale, Baker, and Oldfield, Bouverie-street, Fleet-street, E.C.

A M.R.C.S. Eng., Thirty years of age,

wishes for a Situation as ASSISTANT to a General Practitioner. Salary not less than £100 per annum. Northern Counties preferred., Address, E. C. Mr. Watts', Market-place, Pocklington, Yorkshire.

Mr. James Robinson, Dentist, has

REMOVED from No. 7 to No. 5, GOWER-STREET, Bedford-square, London.

Medical Transfer and Partnership.

30, Bucklersbury, Cheapside.

Mr. Orridge, Medical Transfer Agent,

Referee, and Valuer of Medical Property, may be consulted, at the above Address, by Gentlemen about to receive PARTNERS, or to RELINQUISH or to COMMENCE Practice.

Mr. Orridge is known to many of the Hospital Physicians and Surgeons of London.

He has been concerned professionally for a considerable proportion of the most influential Practitioners (including Partners in many of the leading Medical Firms), to whom he has the satisfaction of being permitted to refer—a privilege that he trusts will be regarded as a proof of the sincerity of his endeavours to conduct these transactions in an honourable and straightforward manner.

Gentlemen desirous of obtaining Mr. Orridge's opinion, or requiring his attendance professionally in any part of England, can obtain terms on application, by (confidentially) transmitting name and address.

Office Hours, from Eleven to Four.

Private Establishment for the Insane,

CHURCH STRETTON, near SHREWSBURY. This Establishment is conducted by the Resident Proprietor, Dr. S. G. BAKEWELL, Son of the late Mr. Bakewell, of Spring Vale, Staffordshire.

The Ladies occupy a separate residence, and are under the immediate care of Mrs. Bakewell.

The neighbourhood of Church Stretton is very picturesque and healthy. Its similarity to Malvern is often noticed.

A Carriage is kept for the use of the Inmates.

References can be given to Medical Gentlemen and others in Shrewsbury, Birmingham, Hereford, and throughout Staffordshire.

Church Stretton is a first-class Station on the Shrewsbury and Hereford Railway, twelve miles from Shrewsbury.

Stockport Infirmary.—Wanted, an

ASSISTANT HOUSE-SURGEON and APOTHECARY. He must be a Member of one of the Royal Colleges of Surgeons, and a Licentiate of the Apothecaries' Hall. His duties will be to visit home patients and assist in the duties of the house. Engagement for two years, at a salary of £50 per annum, with Board and Apartments in the Infirmary. Testimonials to be sent prepaid to Mr. S. W. Wilkinson, Hon. Sec., at the Infirmary on or before the 28th of October. The appointment will be made on the 7th of November, 1859.

By Order of the Committee, S. W. WILKINSON, Hon. Sec.
Stockport Infirmary, October, 1859.

Wallasey Dispensary.—A Duly-

qualified MEDICAL MAN, is required as HOUSE-SURGEON to the above Institution. Testimonials to be forwarded on or before the 20th inst. addressed under cover to the Secretary, WALTER D. PRITT, Hill-side, Wallasey, Cheshire. Each Candidate will be required to pledge himself, if elected, to continue in the appointment for a term of not less than three years. Salary, £100 per annum, with furnished house.

Surgeon for India.—A duly-qualified

Surgeon may obtain a Passage to Bombay in a first-rate ship upon moderate terms. Apply to Douglas and Mills, 23, Billiter-street.

To Parents and Guardians.—Wanted,

by a Chemist, &c., at the West-end a respectable well-educated Youth as an APPRENTICE. If intended for the Medical Profession, he would have every facility for prosecuting his studies, and be allowed to attend the Hospital Lectures during the last year of his articles. A premium would be required. Address, A. B., 22, Upper Ebury-street, Fimlico, S. W.

To Invalids.—A Married Medical Man,

without family, residing in a beautiful and healthy neighbourhood, is desirous of receiving into his house an INVALID LADY. For terms and particulars, address, A. B. 21, Harp-lane, London, E.C.

Epilepsy.—To the Medical Attendant

or Parents of any Young Epileptic Sufferer, whose case would be benefited by a removal from home. The Advertiser would be glad to furnish particulars of a desirable Residence for the same. Considerable experience and attention to this particular object enable him to offer the desideratum of a BENEFICIAL HOME for EPILEPTIC SUFFERERS. The residence in an elevated situation and bracing atmosphere. Unexceptionable references. Address, F. S., Bluck's, stationer, Hampstead, N.W.

To the Medical Profession, Lecturers and

OTHERS.—Mr. J. C. STEVENS is instructed to sell by AUCTION on Wednesday, 19th October, at Twelve o'clock, on the premises, No. 27, Alfred-place, Bedford-square, A most RARE and VALUABLE MUSEUM of WAX MODELS and DRY PREPARATIONS, Collected at Florence, Rome, &c., containing many hundred Models of the Human Frame in Health and Disease, also a Medical Venus, and a splendid full-length figure with fetus and other valuable models "en suite." On view the day before the Sale, and Catalogues had on the Premises, and at Mr. J. C. Stevens' Auction Rooms and Offices, 33, King-street, Covent-garden.

London: Printed by CHARLES REED and BENJAMIN PARDON of 1, 2, and 3, Lovell's-court, Paternoster-row, in the City of London, and published by JOHN CHURCHILL, at the Publishing Office, No. 11, New Burlington-street, in the Parish of St. James, in the City of Westminster.—October 15, 1859.

Ready next week, Fifth Edition, 8vo, cloth.
Fresenius' Qualitative Chemical ANALYSIS. Edited by LLOYD BULLOCK, F.C.S.
* John Churchill, New Burlington-street.

Ready next week, 8vo, cloth, 14s.
A Manual of the Dissection of the HUMAN BODY. By LUTHER HOLDEN, F.R.C.S., Lecturer on Anatomy at St. Bartholomew's Hospital.
* Finding it impossible to complete the Illustrated Edition, as announced for this Session, the Author, in compliance with the earnest request of his class, has reprinted the First Edition with some necessary corrections and emendations.
John Churchill, New Burlington-street.

Fifth Edition, two vols. fcap. 8vo, price 12s. 6d.
The Dublin Dissector, or System of PRACTICAL ANATOMY, comprising a concise Description of the Bones, Muscles, Vessels, Nerves, and Viscera, also the Relative Anatomy of the different Regions of the Body; for the Use of Students in the Dissecting Room. By ROBERT HARRISON, M.D., V.P.R.C.S.I., M.R.I.A. Illustrated by 100 Engravings on Wood.
"A work highly and justly esteemed for its amount of information and clearness of arrangement and language. In its present enlarged and improved state it will supply every instruction that the student can require, and it will be the very best companion he can take to the dissecting-room."—William Lawrence, Esq., President of the Royal College of Surgeons, London.
"I have always considered the work the best of its kind; and in this new edition its superiority is, I find, much increased."—S. Wharton Jones, Esq., F.R.S.
"An elegant and valuable work, the companion equally of the lecture theatre and dissecting room."—Medical Gazette.
"Far above all other competitors in its own peculiar department." "It has no rival in any language."—Dublin Journal of Medical Science.
London: Longman and Co.

Fcap. cloth, price 12s. 6d.
Dr. Churchill's Theory and Practice OF MIDWIFERY. The Third Edition, Corrected, Improved, and considerably Enlarged, with extensive Statistics, and illustrated by 119 Wood Engravings.
London: Henry Renshaw, 356, Strand. Dublin: Fannin and Co.

Foolscap 8vo, price 12s. 6d. cloth,
A Manual of Practical Therapeutics, considered chiefly with reference to Articles of the Materia Medica. By EDWARD JOHN WARING.
Smith, Elder, and Co., 65, Cornhill.

Just published, in post 8vo, with woodcuts, price 6s. cloth.
A Manual of Operative Surgery on the DEAD BODY: with Illustrations. By THOMAS SMITH F.R.C.S., Demonstrator of Anatomy and Operative Surgery at St. Bartholomew's Hospital, and Surgeon to the Great Northern Hospital.
London: Longman, Green, Longman and Roberts.

Just published, post 8vo, cloth, 7s. 6d.
On the Diseases and Injuries of the JOINTS. Clinical and Pathological Observations. By THOMAS BRYANT, F.R.C.S., Assistant-Surgeon and Lecturer upon Operative Surgery at Guy's Hospital.
John Churchill, New Burlington-street.

Just published, 8vo, cloth, 6s.
A Practical Account of General PARALYSIS: its Mental and Physical Symptoms, Statistics, Causes, Seat, and Treatment. By THOMAS J. AUSTIN, M.R.C.S. Eng., lately Medical Officer at Bethnal House Asylum.
John Churchill, New Burlington-street.

Just published, Second Edition, fcap 8vo, cloth, 3s.
Phthisis and the Stethoscope; or, the Physical Signs of Consumption. By RICHARD PAYNE COTTON, M.D., Physician to the Hospital for Consumption and Diseases of the Chest, Brompton.
John Churchill, New Burlington-street.

Just published, in 8vo, pp. 430, price 10s. 6d. cloth,
Lectures on Pathological Anatomy, with accompanying Tables, being a systematic Treatise on the subject, and a complete Manual for Students. By SAMUEL WILKS, M.D. Lond., Fellow of the Royal College of Physicians, Assistant-Physician to Guy's Hospital, Lecturer on Pathology, and Curator of the Museum.
"Dr. Wilks has undertaken a task which we will venture to say that few men in this country are capable of performing as well as he. A book of this kind done in this form and fashion was most needed in our language; and one especial excellence we should notice in connexion with it is, that the author is not a mere pathological anatomist, but a Physician and a Gazetteer.
London: Longman, Green, Longman, and Roberts.

Fifth Edition, 8vo, price 15s.
Neligan's Medicines, their Uses and MODE of ADMINISTRATION.
Besides numerous and important Additions, the entire work has been thoroughly Revised, and all the formulæ contained in the British Pharmacopœias are, now for the first time, given at length.
London: Longman and Co.

J. Z. LAURENCE ON CANCER.
Just published, Second Edition, Revised and Enlarged, 8vo, Plates, 7s. 6d.
The Diagnosis of Surgical Cancer.
By J. ZACHARIAH LAURENCE, F.R.C.S., M.B. Lond., Surgeon to the South London Ophthalmic Hospital, &c., &c.
John Churchill, New Burlington-street.

Just published, 8vo, 1s.

Illustrations of the Use of the
OPHTHALMOSCOPE. By WILLIAM MARTIN, F.R.C.S., late
Professor of Ophthalmic Surgery, Calcutta Medical College.
John Churchill, New Burlington-street.

In the Press, and shortly will be published, the Fourth Edition,
considerably enlarged,

The Pathology and Treatment of
STRICTURE of the URETHRA: its Complications and Effects.
By R. WADE, F.R.C.S.
John Churchill, New Burlington-street.

Re-issue, Two Vols. 8vo, cloth, 30s.

The Microscopic Anatomy of the
HUMAN BODY in HEALTH and DISEASE. Illustrated with
numerous Drawings in Colour. By ARTHUR HILL HASSALL, M.D.,
L.R.C.P.

"Every page of it is a banquet, unfolding the marvels of creative wisdom
and power. Such extraordinary displays of the minute organisation of
the internal mechanism of our bodies, in the two conditions of health and
disease, create a strange feeling of wonder and amazement. While the
work teaches how to understand appearances, it also points out the
physiological functions and anatomical relations of parts. In short, the
why and the wherefore in the subjects treated of are presented in a clear
light."—Boston Medical and Surgical Journal.

"We express the conviction, forced upon us, after several years' con-
sultation of similar works, while pursuing microscopical studies, that
there is none better arranged and illustrated, and none which will give so
general satisfaction, as that of Dr. Hassall, edited by Dr. Van Arsdale."—
New York Journal of Medicine.

John Churchill, New Burlington-street.

Just published, Third Edition, 8vo, cloth, 12s. 6d.

On the Action of Medicines in the
SYSTEM. By FREDERICK W. HEADLAND, M.D., L.R.C.P.
"Such a treatise as Dr. Headland's doubtless was wanted, and the
vacancy has been filled by this gentleman in a manner which is as credit-
able to the scientific medicine of this country as it is honourable to him-
self."—Lancet.

"The Author's remarks all through this book appear to us sensible and
to the point, and the entire work must command the most attentive con-
sideration of the reader."—Dublin Medical Press.

John Churchill, New Burlington-street.

Just published, post 8vo, cloth, 10s. 6d.

On the Diseases of the Stomach, with
an Introduction on its Anatomy and Physiology. By WILLIAM
BRINTON, M.D., Lecturer on Physiology at St. Thomas's Hospital,
Physician to the Royal Free Hospital.

"As one of our first writers upon the structure, functions, and diseases
of the alimentary canal, the author of the present treatise has for some
time established his reputation. We recommend Dr. Brinton's work as an
honourable addition to the really scientific literature of the day."—Lancet.

"These Lectures are intended to give a brief but complete account of
what is at present known concerning the Diseases of the Stomach; the
whole work will fully repay a careful study, and we heartily recommend
it to our readers."—Medical Times and Gazette.

"Dr. Brinton has made for himself a legitimate claim to write a book,
and to be looked to as an authority in the subject on which he professes to
instruct."—British Medical Journal.

John Churchill, New Burlington-street.

Just published, 8vo, cloth, 12s.

Illustrated by 17 Coloured Figures and 41 Woodcuts,

On Wounds and Injuries of the Eye.
By W. WHITE COOPER, F.R.C.S., Surgeon Oculist in Ordinary
to Her Majesty, Ophthalmic Surgeon to St. Mary's Hospital, &c.

"A book of very practical character, and one that contains a large
amount of information on a subject upon which hitherto we have pos-
sessed no English monograph. The volume is profusely and elegantly
illustrated, and bids fair to become a favourite with the Profession."—
Medico-Chirurgical Review.

"We consider that a more able exposition of the doctrines of the new
school of Ophthalmic Surgery, than Mr. White Cooper's work, has not
emanated from the Medical press of this country."—British Medical
Journal.

John Churchill, New Burlington-street.

Just Published, the Eighth Edition, price 12s. 6d.

Druitt's Surgeons' Vade-Mecum; a
Manual of Modern Surgery, the Eighth Edition, much enlarged,
improved and illustrated, by 328 highly-finished Wood Engravings.
London: Henry Renshaw, 356, Strand, and John Churchill,
New Burlington-street.

DR. KIDD'S MANUAL OF ANÆSTHETICS.
Price 4s. 6d.

On Ether and Chloroform.

By CHARLES KIDD, M.D.

"This work by Dr. Kidd supplements the posthumous book by Dr.
Snow; and is evidently intended to take a high place amongst
our standard manuals and monographs."—Medical Circular.

"Dr. Kidd will creditably fill the shoes of the late Dr. Snow."—
Edinburgh Medical Journal.

London: Henry Renshaw, 356, Strand.

Just published, price 6d. 6d., postage 4d.

Meade's Manual for Apothecaries'
HALL, or other MEDICAL INSTITUTIONS. Third Edition,
Corrected to the present time. Or sold separately—

Part 1, for the First Examination, price 4s., postage 2d.

Part 2, for the Second Examination, price 2s. 6d., postage 1d.

London: Henry Renshaw, 356, Strand.

DR. LITTLE ON DEFORMITIES.

In 8vo, with 160 Engravings and Diagrams, 15s. cloth,

On the Nature and Treatment of
CONTRACTIONS and DEFORMITIES. By W. J. LITTLE, M.D.

Senior Physician to the London Hospital, Founder of the Royal Orthopaedic
Hospital, &c.

CONTENTS.

1. Deformities in general. Treatment Operative, Instrumental, and
Physiological. Forcible Extension under Chloroform.
2. Contractions from Wounds and Diseases of Joints, Accidents, Rheuma-
tism, &c.
3. Contractions from Spasm, Paralysis, Burns, Habitual Retention in one
Position.
4. Deformities from Rickets, Weakness, and Curvatures of Bones.
5. Congenital Distortions and Dislocations, Club-foot, Club-hand, &c.
6. Congenital Malformations, Monstrosities.
7. Distortions of the Spine, from Strumous Disease, Rickets, Lateral
Curvature, Spasm, and Paralysis.

Appendix: On Relapsed and Neglected Cases. Index.
"The best treatise on the subject in any language."—The Lancet, the
British and Foreign Medico-Chirurgical Review, and the Philadelphia
Medical Examiner.

On CLUB-FOOT and ANALOGOUS DISTORTIONS,
including their Treatment both with and without Surgical Operation.
8vo. Forty-one Engravings. 12s.

On ANCHYLOSIS or STIFF JOINT: a Practical
Treatise on the Contractions and Deformities resulting from Diseases of
the Joints. 8vo. Thirty-two Engravings. 7s. 6d.

London: Longman, Brown, Green, and Longmans.

Just published, in post 8vo, price 5s. 6d. cloth,

Handbook of Hospital Practice; or, an

Introduction to the Practical Study of Medicine at the Bedside;
with Case-forms, Glossary, and Index. By ROBERT D. LYONS, K.C.C.
M.B.T.C.D. &c.; Physician to Jervis-street Hospital, Dublin.

"Such a work affords abundant to himself and real benefit to the
room for the display of extensive class of readers for whom it is in-
and well-digested information, tended. The manner in which Dr.
sound practical knowledge, and cul- Lyons has acquitted himself of this
tivated powers of observation; and difficult and important task is deserv-
ing of all praise."—Medico-Chir-
physician could execute it with credit- ical Review.

London: Longman, Green, Longman, and Roberts.

The Third Edition of Peaks, Passes,

and GLACIERS, is now ready, price 21s. cloth.

The Third Edition of "Peaks, have been made throughout the
Passes, and Glaciers," contains a work. A notice of some Excursions
Abstract of the new Chamounix made by Members of the Alpine
Regulations as to Guides, which have Club during the past summer is
been made in consequence of a Me- added to the Preface. The Eight
morial to the Sardinian Minister from Swiss Maps, accompanied by a Table
the Committee of the Alpine Club; of the Heights of Mountains may be
and a few Additions and Corrections had separately, price 3s. 6d.

London: Longman, Green, Longman, and Roberts.

Second Edition, fcap. 8vo, price 12s. 6d.

Churchill on Diseases of Children.

"It is indispensable to the General Practitioner."—Medical Circular.
"As the work now stands, it is, we believe, the most comprehensive
treatise in the English language upon the diseases incident to early life."
—Dublin Quarterly Journal.

London: Longman and Co.

Fourth Edition, fcap. 8vo, price 12s. 6d.

Churchill on the Diseases of Women,

INCLUDING THOSE OF PREGNANCY AND CHILDBED.

"It has the testimony of our unqualified approbation. It surpasses
any other that has ever issued on the same subject from the British
press."—Dublin Medical Journal.

"A standard work of reference for the accoucheur and general prac-
titioner."—Edinburgh Medical and Surgical Journal.

"As an epitome of all that is known in this department of Medicine,
the book before us is perhaps the fullest and most valuable in the English
language."—Dublin Medical Press.

London: Longman and Co.

Now ready, price 5s. 6d., or free by post to any part of the United King-
dom, price 6s., Fourth Edition, greatly enlarged and improved,

A Grammatical Introduction to the
LONDON PHARMACOPŒIA, and a KEY to PHYSICIANS
PRESCRIPTIONS. By F. S. LEACH.

"This little work will be found extremely useful to students who have
received but an imperfect classical education."—The Lancet.

Hughes and Butler, Medical Booksellers and Publishers, 15, St.
Martin's-le-Grand.

Pepsine.—M. Boudault begs to state

that he cannot be answerable for the purity and strength of any Preparation sold under his name unless obtained from his sole Agent, Mr. PETER SQUIRE, Her Majesty's Chemist, 277, Oxford-street, London, to whom all applications respecting it must be addressed.

Second Edition of Boudault on "Pepsine," with Remarks by English Physicians. Edited by W. S. SQUIRE, Ph. D., published by J. Churchill, London, may be also had of the Author, 277, Oxford-street, price Sixpence.

Dr. Caplin's Electro-Chemical Bath

ESTABLISHMENT, 9, YORK PLACE, BAKER STREET, PORTMAN SQUARE, for the extraction of Mercury, and other Metallic or Extraneous Substances, and the Treatment of Chronic Diseases. For the demonstration of this new system, vide the Second Edition, price 1s., 8vo, of Dr. Caplin's Treatise on the Electro-Chemical Bath, and the Relation of Electricity to the Phenomena of Life, Health, and Disease. Sold at the Author's Establishment.

For Infants.—The British Feeding

BOTTLE (registered) may be placed in any position without the Food running out. The supply can be regulated by a stop-cock; being electroplated, it may be instantaneously cleaned. Unlike wood, ivory, or bone, it is impervious to moisture, cannot crack or become sour; there is no possibility of the infant drawing air with the food.

By W. T. COOPER, Pharmaceutical Chemist, 26, Oxford-street, London. Price 7s. 6d., or free to any Railway Station, 8s. 6d.

Scammony Manufactured from the

ROOT.—This Pure Resin may be had of all Wholesale Druggists at 25 per cent. under the price of the best Virgin Scammony.

And the superiority of its quality was fully explained at a meeting of the Pharmaceutical Society, and reported at length in their Journal of March last, from which the following are extracts:—

"From these numerous observations, one hundred and twenty in number, together with many others which have not been tabulated, I am quite convinced that the scammony prepared by the new process from the untapped root is quite equal, as a remedy, to the very best virgin scammony which is met with in commerce, and equal, in fact, to the resin which is extracted from commercial scammony by means of ether; and it possesses this most important advantage over the scammony of commerce, namely, of being entirely free from the frauds which are almost constantly practised upon it in the country where the plant grows, and in which it has hitherto been collected, and, therefore, being perfectly uniform in its physical characters, composition and therapeutic action. There can, therefore, be no objection, but, on the other hand, manifest advantage, in employing it in place of the scammony commonly met with."

"A. B. GARROD, M.D., F.R.S., F.R.C.P."

"Professor of Materia Medica, Therapeutics and Clinical Medicine at University College; Physician to University College Hospital."

"I have endeavoured to ascertain the relative activity of Messrs. M'Andrew's scammony, and of a fine specimen of commercial virgin scammony, by prescribing these drugs alternately in equal doses to the same patient. The results, according to the judgment of myself and others who have assisted me in watching the cases, is that in most instances Messrs. M'Andrew's scammony has proved itself decidedly more active than the virgin scammony. As to pleasantness of operation, or the reverse, there seemed to be no choice between the two specimens."

"That a preparation of scammony should be a little more or a little less active is of comparatively small importance. It is far more important that the drug should have a fixed and uniform composition and activity, so that the prescriber may know, with an approach to certainty, what doses are required to produce a given effect. This advantage of uniform activity Messrs. M'Andrew's scammony seems likely to possess over the scammony which has hitherto been in common use, and which is a drug notoriously of most uncertain composition and power."

"GEORGE JOHNSON, M.D., F.R.C.P."

"Professor of Materia Medica and Therapeutics in King's College; Physician to King's College Hospital."

Superphosphate of Iron and Super-

PHOSPHATE OF IRON and LIME. New Remedial Agents introduced to the notice of the Profession at the Meetings of the Medical Society of London, and now extensively employed by the most eminent members of the Medical Profession. The Syrup is the most eligible mode of administering these valuable Remedial Agents. Mr. GREENISH will be happy to forward a variety of cases which have been furnished to him, where its success has been most marked, and which will serve to indicate where it may be most advantageously employed.—20, New-street, Dorset-square.

Pillischer's Achromatic Microscopes.—

To meet the daily increasing demand for his Microscopes, M. PILLISCHER has recently completed extensive alterations in his workshops to enable him to manufacture MICROSCOPES and their Object Glasses upon a more expeditious and extensive scale. M. P. has the pleasure of informing the Profession that he is now able to furnish Microscopes of the very greatest perfection; possessing every modern improvement; and with Object Glasses of a quality unsurpassed by any other maker, on the shortest notice, and at very moderate prices.

PILLISCHER'S £7 7s. STUDENTS' MICROSCOPE, for which a prize Medal was awarded to him at Paris Exhibition, 1855 deserves particular notice. It consists of a well-constructed Stand, with coarse and fine adjustments, a capital Stage, with Diaphragm and Large Mirror, one Eye-glass, one and one quarter inch Object Glasses, 16° and 75° angular aperture, and a neat Mahogany Case about 7 in. square. The above, Microscope when further completed with the addition of a Second Eye-glass, Condenser for Opaque Objects, Live Box, Stage Forceps, large Glass Stage, and Polarising Apparatus, price £10, forms a most complete and valuable Microscope, and in every respect as useful as a much more expensive one.

A Catalogue post free on application to M. Pillischer, Optician, 88, New Bond-street, London, W.

Priced Catalogues of the above may be had, post free, on application. Printing of every Description at Moderate Prices.

ADDITIONAL TESTIMONY ON THE EXTRAORDINARY EFFICACY OF

DR. J. COLLIS BROWNE'S

(M.R.C.S.L., EX-ARMY MEDICAL STAFF)

C H L O R O D Y N E.

MEDICAL PROPERTIES—Anodyne, Diaphoretic, Sedative, Astringent, Antispasmodic, Diuretic.

A few Extracts of Medical Reports are furnished in testimony of the exceeding value of this New Remedial Agent.

The following extract from a letter by Dr. SHORTHOUSE (late of the Metropolitan Convalescent Hospital), of Carshalton, to a Medical friend in the North of England, is published by permission:—

.....“And now, my friend, about ‘Chlorodyne’—the infallible and incomparable Chlorodyne! The best idea I can give you of my estimate of its value will be in the fact, that I have within the last fifteen months used 160 ounces of it, and, as each ounce contains about fifty adult doses, I have given at least 8000 doses. This is what I have administered myself, and is altogether independent of a large quantity which I have prescribed, and the patients have procured for themselves. It is, as I said before, a remedy quite *unique*, and its effects totally dissimilar to those of opium or any other English medicine. It requires some little management in its administration, so as to ensure its best effects. Out of the many hundreds of patients for whom I have prescribed it, I have found it disagree with but three.

“Its mode of action is that of an astringent in suppressing hæmorrhage and diarrhoea; an anti-spasmodic in colic and all forms of spasmodic cough; an anodyne in allaying pain and excitement, and producing tranquillity and a most heavenly state of repose.

“The cases (among others) in which I have employed it have been twelve cases of phthisis; eight of these patients had been examined by other Medical men, and had been regarded as genuine cases of consumption, so that the nature of the disease does not rest upon my testimony alone. They were all well-marked cases; for I do not mention several others in an incipient stage. Two of the cases were in the last stage—i.e. cavities had formed in the lungs; two others were bordering upon this stage. The remaining eight were in the second stage—that of softening; in five of these hæmoptysis was a prominent symptom. All these cases have done, or are doing, exceedingly well. Five of them have quite recovered; the others, with one exception, are in a fair way towards recovery.

“I have used it in many cases of whooping-cough and bronchitis, especially that form of the disease attended with laryngeal complication, i.e. irritation of the superior laryngeal nerve, with a very harassing spasmodic cough; and in these cases I can speak of it as a remedy of the highest value.

“In dysentery and dysenteric diarrhoea, and in mucous diarrhoea with pain round the umbilicus, it is invaluable; one dose, or at most two, being sufficient. In simple diarrhoea it is hardly worth while giving it a trial. But its effects are most marked in cases of hæmorrhage, which it will arrest almost instantaneously; I have had several proofs of this. In some forms of neuralgia it also affords relief in a very short period.

“I hope I have now said enough to induce you to give it a trial. But don't be misled; it is not a cure-all, nor did I ever ‘puff it off as a universal panacea for all ailments.’ It is what is perhaps better—a valuable therapeutic agent, with which you may successfully combat disease in many of its forms, and those forms most frequent and most formidable. In addition to its astringent and anodyne properties, it also possesses remarkable chemical ones, and has a marvellous effect upon the absorbent and nutritive functions. I have seen cases of secondary sores and indolent ulcers assume quite new features, when the ordinary remedies have been combined with small doses of Chlorodyne.”

From W. VESALIUS PETTIGREW, M.D., Hon. F.R.C.S. Eng.; formerly Lecturer upon Anatomy and Physiology at St. George's School of Medicine.

“I have no hesitation in stating, after a fair trial of Chlorodyne, that I have never met with any medicine so efficacious as an anti-spasmodic and sedative. I have used it in consumption, asthma, diarrhoea, and other diseases, and am most perfectly satisfied with the results.”

From the “MEDICAL TIMES.”

“TO THE EDITOR OF THE MEDICAL TIMES AND GAZETTE.

“SIR,—In reply to an inquiry made by your correspondent, who subscribes himself ‘Nota Bene,’ whether any cases of benefit from ‘Chlorodyne’ have come to the knowledge of your readers, I beg to say that I have been greatly pleased at the results in a case of severe pain in the hip-joint and in the vertebrae of the neck, which came on in a man long subject to chronic rheumatism, attended with permanent enlargement of the knees, ankles, and one of the wrists. He could not tolerate Opium, Hyoscyamus, or Belladonna, and in despair almost I gave him a prescription for a mixture of Chlorodyne in water, the dose being twelve minims. He took only two doses, which acted so well that he compared his feelings to being transported to Paradise. The effects lasted for several days. Whenever his pains return, he now takes a dose at bedtime, feeling secure of an escape for some days from suffering. I have also applied it locally, with good results, but in too few cases to report much upon it. It produces a certain amount of warmth and perspiration, with a remarkably soothing state of mind, as well as arresting the pain. No headache or other unpleasant symptoms followed its administration.

“I am, &c. “THOMAS A. HENDERSON, M.D., L.R.C.P.,

“Physician to the Ramsgate Infirmary.

“The Vale, Ramsgate, September 23, 1857.”

Extracts from the General Board of Health, London, as to its efficacy in Cholera.

“1st Stage, or Premortuary.—In this stage the remedy acts as a charm; one dose generally sufficient.

“2nd Stage, or that of Vomiting and Purging.—In this stage the remedy possesses great power, more than any other we are acquainted with, two or three doses being sufficient.

“3rd Stage or Collapse.—In all cases restoring the pulse. So strongly are we convinced of the immense value of this remedy, that we cannot too forcibly urge the necessity of adopting it in all cases.”

From THOMAS F. HALE, Esq., Surgeon, Saundersfoot, Pembrokeshire.

“SIR,—I should be much obliged by your forwarding three bottles of Dr. J. Collis Browne's Chlorodyne, which I have found most useful in allaying pain. I have used twelve ounces of it, and in nearly every case in which I have employed it, have every reason to be satisfied with the result; and although I object, as a rule, to use any preparation of a secret nature, and of whose composition I am not fully acquainted with, still, having once tried the Chlorodyne, and found that it really did produce the effects stated, I do not think I should be justified in withholding such a preparation from my patients when I see the value of the remedy.”

From C. V. RIDOUT, Esq., Surgeon, Egham, Surrey.

“SIR,—Having extensively used Dr. J. Collis Browne's Chlorodyne, I feel it incumbent upon me to add my testimony to the numerous evidences you have already received of the undoubted efficacy of this remedy. As an astringent in severe diarrhoea, and an anti-spasmodic in colic, with cramps in the abdomen, the relief is instantaneous. As a sedative in neuralgia and tic douloureux, I can record a case where its effects were very remarkable. It occurred in January last. A gardener applied to me with pain in the head, resembling most distinctly tic douloureux as usually met with in the face; it was impossible for him to prevent his head moving from side to side with great regularity at intervals of five seconds. The

CAUTION.—Be sure to ask for Dr. J. COLLIS BROWNE'S CHLORODYNE; disappointment will result from any other.—See the Manuscript Signature.

Price 3s. per ounce, and in quantity of 10 ounces carriage free.

Sole Agent and Manufacturer—J. T. DAVENPORT, Operative and Pharmaceutical Chemist, 33, GREAT RUSSELL-STREET, BLOOMSBURY-SQUARE, LONDON.

ORIGINAL COMMUNICATIONS.

ON THE RECENTLY PREVALENT
MALARIOUS AFFECTIONS.

By THOMAS B. PEACOCK, M.D., F.R.C.P.

Assistant-Physician to St. Thomas's Hospital, and Physician to the
Hospital for Diseases of the Chest, Victoria-park.

[Read at the Hunterian Society, October 5, 1859.]

I.—IN 1857, in a communication to this Society, I alluded to the unusual frequency of malarious diseases at that time in the metropolis. This prevalence has continued up to the present time, and I propose in this paper to make some remarks on the extent and probable cause of the greater frequency of such affections, and on the different forms which they have assumed.

Since the commencement of the present decennial period the number of cases of ague which has been treated at St. Thomas's Hospital has undergone a great, though not regular increase. In the years 1850 and 1851 the returns which I have obtained refer only to the out-patients, and of these 26.5 and 15.7 per 1000 were cases of ague. From this period to the present time I am enabled to give the proportion of ague cases both in the in and out-patients, and I find that in 1852 and 1853 they amounted to 18.4 and 23.7 per 1000 of the cases of all forms of disease. In 1854, from the general prevalence of cholera, an exceptional year, the proportion was only 16.6, and in 1855 it fell to 12.3. In 1856, 1857, and 1858, the number of cases increased and attained the proportions of 20.7, 40.2, and 46.5; and during the nine months which have just expired, the proportion reached 56.7 per 1000—a higher rate than we learn from Sir Gilbert Blane existed when he was Physician to St. Thomas's Hospital from 1783 to 1794 (50.01 per 1000).

The increased prevalence of aguish affections during the last three or four years, is confirmed by the Registrar-General's weekly reports of the deaths from different causes in the metropolitan districts. Thus in 1850, the number of ague cases registered was in the proportion of .37 per 1000 of the whole of the deaths recorded. In 1851, they were in the proportion of .34; in 1852, of .33; in 1853, of .39; and in 1854, of .32; or exclusive of the deaths from cholera, of .38. In 1855, they were .35; in 1856, .51; in 1857, .35; and in 1858, .67. In the thirty-nine weeks of the present year, terminating October 2, the proportion of deaths from ague has been again considerably above the average, or .47.

From the tables of the causes of death in the metropolitan sub-districts not being completed up to 1858, I am not able to ascertain whether the recent increase in the cases of ague registered, was equally distributed over the different districts in which the disease prevails. There can, however, be no doubt that some portion of the increase must be ascribed to a larger number of persons being exposed to the influence of the paludal poison, rather than to the greater intensity of the morbid cause itself. There is certainly a greatly increased population in the marshy parts of Woolwich and Greenwich, since the extension of the Government and other works, and in the West Ham and Plaistow marshes since the formation of the Victoria Docks.

In a disease which, like ague, has a very low death-rate, the amount of mortality affords a very inadequate indication of the relative frequency of the affection at different periods; but as I am not in possession of other statistical data (a), I have inspected the Registrar-General's manuscript tables of the

causes of death in different districts with the view to ascertain how far the increased prevalence of ague has been confined to the metropolis, or has occurred in the malarious districts generally. The districts which I have selected for comparison are those of North Aylesford in Kent, Huntingdon, and Wisbeach, in Cambridgeshire; they are among the most aguish localities in the country, represent two distinct foci of the disease, and are at a considerable distance from London. Their populations are generally stationary, and they therefore present results not subject to much error from the amount of imported disease.

In North Aylesford, I find that the deaths from ague registered in 1850 amounted to 19.1 per 1000 deaths from all causes; in 1851 they were 31.2; in 1852, 19.5; in 1853, 37.3; and in the exceptional year, 1854, 9.07. In 1855 no death from ague was registered; in 1856 they were in the proportion of 15.2; in 1857, of 25.2; and in 1858, of 23.3.

In Huntingdon, the deaths in the year 1851 were in the proportion of 7.2 per 1000 to those from all causes; and in the seven subsequent years, of 11.6, 34.09, 7.5, 7.7, 5.4, 12.1, and 2.3.

In Wisbeach, the proportion of the deaths from ague to those from all causes was, in 1850, 4.5 per 1000; in 1851 no death from ague was registered; in 1852, they were in the proportion of 5.7; in 1853, of 3.4; and in 1854, of 1.05. In 1855, again, the disease did not cause death in any case; and in 1856, 1857, and 1858, the mortality which it occasioned was in the proportion of 2.94, 9.1, and 6.4.

The prevalence of ague may thus be inferred to have been, in all the districts, high at the commencement of the period; very high in 1852 and 1853; low in 1855; and again high in 1856 and 1857; and the higher rate was continued in North Aylesford and Wisbeach throughout 1858.

These results very closely correspond with those obtained in the metropolis from the number of cases admitted into St. Thomas's Hospital, and of deaths recorded in the Registrar-General's returns. They are also supported by the general experience of Medical men practising in aguish districts. Mr. Henry Even, whose long residence and extensive practice at Long Sutton, in the fens of Lincolnshire, enables him to speak with confidence, informs me that ague and neuralgia have been more prevalent in 1857, 1858, and 1859 than at any previous time (1848 only excepted) for a period of thirty years. During a recent visit to Holland, I was informed that intermittent and remittent fevers were also unusually common in that country at the present time.

The period over which the calculations extend is too short to justify any decided inferences as to the influence of meteorological conditions on the production of ague. It will, however, be seen that the years 1852 and 1853 in which ague was very prevalent, were characterized by a high temperature (50.6°) in the first year, and a low one (47.8°) in the second, while the fall of rain was in the first year very large (34.4 ins.), and in the second much above the average (29.6). The year 1855, when ague was of less frequent occurrence, had a very low average temperature (46.9°—1.5°), and a small fall of rain (21.1—4.8°). In the year 1856, when ague became more prevalent, the temperature was about the average (49.1°), and the fall of rain continued small (21.9 in.). In 1857, also an aguish year, the temperature was very high (51.1° or + 2.6), and the fall of rain still small (21.4 in. or — 5.5), and 1858, with a still greater frequency of ague, was a warm (49.3° or + 0.9) and very dry season (17 in. or — 6.6). During the present year, in which the prevalence of ague has increased, the weather has been warm and, till recently, dry. These facts are in accordance with the generally received opinion that the greater warmth of the weather conduces more than unusual moisture to the development of the paludal miasms. Indeed, excepting the very rainy and aguish years, 1852 and 1853, it appears that ague has been most prevalent in seasons in which the fall of rain was deficient. The years named are scarcely opposed to this conclusion, as in 1852 the fall of rain was deficient in the first quarter, slightly above the average in the second, and only very large in the autumn and winter quarters, while ague was prevalent from the commencement of the year. So also in 1853 the excess in the fall of rain was only in the summer quarter, while ague was very common in the spring as well as in the summer. It does not, however, necessarily follow that with a small fall of rain, the marshy districts of the country are unusually dry,

(a) I regret that the elaborate Tables of the Cases of Epidemic Disease treated in the Peterborough Infirmary and Dispensary, published by Dr. Paley in the triennial reports of the Institution, do not embrace the last three years, or they would have afforded valuable data for comparison. Dr. Paley writes me word that the report is in course of preparation.

for from the more efficient land drainage, the rain-fall now more rapidly reaches the rivers than formerly, and it is agreed that floods have become more common. There are, however, reasons to believe that the less amount of moisture conduces to the spread of malarious affections. We know that in hot climates it is not during the summer rains that the remittent and intermittent fevers chiefly prevail, but after the excessive wet has drained off and the land is becoming dry. The Medical Officers of the Army in the Netherlands during the last century, noticed that the soldiers suffered most when the moisture which had fallen in autumn and winter, was drying up in spring and summer. Dr. Hamilton tells us that after the country around Lynn had been submerged by the breaking of the embankments, malarious affections were very prevalent while the land was becoming dry. Similar observations have been made as to the effect of laying bare ground long covered by water, or exposing the soil in the making of roads, railroads, or canals in marshy districts. One of the most severe cases of remittent fever which I have seen in this country was apparently caused by the spreading of diluvial matter, removed in deepening an old reservoir over the adjacent land; and some short time ago I was consulted by a gentleman who had returned home from Ceylon suffering under jungle fever which he said he had taken from a portion of the lake of Colombo, in front of his house, having been drained,—the locality having previously been entirely free from the disease. This inference is further supported by the circumstance that the largest proportion of cases of ague occur in spring and summer. Thus of 838 cases treated among the out-patients at St. Thomas's in the years 1855, 1856, 1857, and 1858, 96 or 11·4 per cent. occurred in winter—January, February, and March; 381 or 45·4 in spring—April, May, and June; 224 or 26·7 in summer—July, August, and September; and 137 or 16·3 in autumn—October, November, and December.

Absence of the usual cold weather during winter also appears as would, *a priori* be anticipated, to conduce to the prevalence of ague. The year 1855 which it has already been said was remarkably exempt from ague, was not only a cold year throughout, but the winter was extremely cold ($34^{\circ}1'$ or $-4^{\circ}3'$), and the spring also was below the average ($50^{\circ}5'$ or $-1^{\circ}6'$); on the contrary, 1852 which was an aguish year, had a high winter temperature (44° or $+3^{\circ}1'$), and an average degree of warmth in spring. In 1856, also a year in which ague was prevalent, both the winter ($40^{\circ}7'$ or $+1^{\circ}7'$) and spring were warm ($52^{\circ}3'$ or $+0^{\circ}6'$). The same occurred in 1857 ($39^{\circ}2'$ or $+0^{\circ}8'$, and $53^{\circ}8'$ or $+1^{\circ}8'$), and in 1858, though the winter temperature was slightly below the average ($37^{\circ}8'$ or $-0^{\circ}5'$), the spring was unusually warm ($54^{\circ}3'$ or $+2^{\circ}2'$). In the present year, in which ague has been more prevalent than at any recent period, the temperature of the winter was very much above the average ($43^{\circ}3'$ or $+4^{\circ}9'$) and the spring was also warm ($54^{\circ}1'$). The year 1853, in which ague prevailed considerably, was, however, an exception to this rule, as not only was the general temperature below the average, but the deficiency existed in all the quarters.

II.—The forms of malarious affection which have been recently prevalent may be classed under four heads:—

1. Cases of ordinary intermittent fever.
2. Cases of remittent fever.
3. Cases of spontaneous anæmia probably dependent on malarious poisoning. And
4. Various painful and spasmodic affections, assuming a regular or irregular periodic character.

1st. In reference to the first class of cases, but little comment is necessary. I may, however, remark that ague has not only been recently more prevalent, but also less amenable to treatment than formerly. As seen in London, it is very generally an imported disease, the patients coming to town while suffering under the paroxysms. When also it appears in persons living in town districts, it is generally found on inquiry, that they have resided a short time previously in some well-known malarious locality, though they may not have had any aguish symptoms while in the infectious atmosphere. I have, however, within the last year or two met with some instances in which the symptoms of the disease were well marked, but in which the patients did not reside in an aguish locality, and had not, so far as could be

ascertained, been exposed to the causes of the disease elsewhere. In such instances, however, it is quite possible that some local source of malaria might have been detected on examination of the house or situation occupied by the sufferers. On looking over the notes of the cases of ague treated among the out-patients at St. Thomas's Hospital, during the last twelve months, I find that in thirty the patients resided at the time they came under treatment in different town districts. Of this number, twenty-one, or 70 per cent., either came into London suffering from the disease, or had been in malarious localities within a short time of the commencement of the attacks; while in some of the remaining nine cases, it is not clear that full inquiries were made as to the sources of the infection. Not unfrequently Irish labourers, residing in the Borough, work during the harvest in Kent or Essex, or, during the hop-picking, in Kent or Sussex, or in those or other districts during the potato digging, without having any symptoms of ague; but on their return to town in the late autumn or early spring, they suffer from the disease. In such instances, when questioned as to the place where they contracted the disease, they generally at once name some well-known aguish locality, and often confirm their assertion by the information that others of their company had ague while residing there. In many cases, the patients state that they have had ague at intervals for months or even years.

The period of exposure which is sufficient to cause the disease, is sometimes remarkably short. A lady, residing in a dry house in a healthy and well-drained locality in the suburbs of London, where, certainly, there is no aguish influence, went, during the last autumn, to Lynn. She arrived there in the afternoon, and at 10 o'clock the next morning was taken with a severe attack of ague. She remained a week, during which she had attacks every day, and, on returning to town, she had three paroxysms at intervals of a day. The disease ultimately yielded to quinine. She had had ague very severely, for some months, twenty-eight years before.

(To be continued.)

REPORT OF THE MEDICAL DIRECTOR GENERAL OF THE RUSSIAN NAVY,

FOR THE PERIOD BETWEEN NOV. 1, 1857, AND OCT. 31, 1858.

Translated from the "*Morskoi Slornik*," a Russian Official Journal,

By JOHN MICHELL, Esq.

THE sanitary condition of the Russian navy has been highly satisfactory for the year ending October 31, 1858, and though a temporary increase in the number of sick, attributable to the unfavourableness of various external influences, has been recorded in some localities, yet it was not due to any extensive development of epidemical disorders; the individual cases of disease being, at the same time, very rarely distinguished by particular virulence.

The following table shows the result of a comparison between the sanitary state of the navy during the ten months of the year 1857, included in the last report, and its condition between November 1, 1857, and October 31, 1858:—

Period.	Ratio of			
	Sick to healthy.	Recovers to sick.	Deaths to Recoveries.	Deaths to healthy.
Between Jan. 1 and Oct. 31, 1857 ..	$1:1\frac{1}{4}$	$1:1\frac{1}{2}$	$1:18\frac{1}{2}$	$1:34\frac{1}{2}$
„ Nov. 1, 1857, and Oct. 31, 1858	$1:1\frac{3}{4}$	$1:1\frac{5}{8}$	$1:21\frac{1}{4}$	$1:39\frac{1}{2}$

This diminution of sickness and relative mortality in 1858, is mainly to be attributed to the improved and more extensive accommodation provided for the naval branch of the service, consequent on the reduction of the strength of the navy; partly also to the absence of epidemics, to the general favourable conditions for health, and to the progressive

introduction of hygienic and surgical improvements, both ashore and afloat. Amongst the latter I can particularly mention the ameliorated state of the Hospitals at St. Petersburg, and the construction of some new divisional lazarettos at Cronstadt, for affording local relief in slight cases.

SURGICAL OPERATIONS PERFORMED.

The Surgical operations performed in the several Hospitals were as follows:—In the Kalinkin (St. Petersburg), 11; Cronstadt, 71; Nikolaef, 2; Sevastopol, 1; Archangel, 2; Total, 87. They consisted of cases:—Amputation of fingers, 30 (recovered, 21; died, 1; remaining under treatment, 8).

Amputation of arm above elbow, 12 (recoveries, 4; died, 7; under treatment, 1). Amputation of arm below elbow, 1 (recovered). Amputation of leg above knee-joint, 7 (recovered) 5; died, 2). Amputation of leg below knee-joint, 6 (recovered, 4; died, 2). Operations on foot, 3 (recovered, 2; died, 1). Amputation of penis, 1 (recovered). Excision of various tumours, 2 (recovered). Excision of cancer in testicle (under treatment). Incisions, 2 (died). Operation on hernia (died). Inguinal hernia, 2 (under treatment). Operation for stricture, 1 (died). Phymosis, 14 (recovered 9; under treatment, 5). Operation for cancer in upper eyelid 1 (recovered). Operation on hydrocele 2 (recovered, 1; under treatment, 1).

Of the above operations 52 were successful, 17 proved fatal, and the remaining 18 continued under treatment.

SUDDEN DEATH.

There were 6 cases of sudden death at St. Petersburg; 95 at Cronstadt; 9 at Archangel; 5 at Revel; 6 at Sveaborg; 1 at Riga; 28 at Nikolaef, and 10 at Sevastopol; making a total of 160.

Of this number 39 were cases of apoplexy; 26 of apoplexy of the lungs; 2 of disease of lungs; 2 of rapid inflammation of the intestines; 2 of rupture of liver; 1 of fall during an epileptic fit; 1 of intussusception; 1 of rupture of enlarged main artery; 1 of uterine hæmorrhage; 1 of aneurism of the heart, of a scorbutic character; 15 of various injuries; 23 of drowning; 1 frozen; 4 suicides by shooting, strangulation and other means; 1 of suffocation by a fall of earth; 18 from various internal chronic complaints; 22 of various acute internal diseases, and 1 case of which the cause of death could not be ascertained, in consequence of the advanced state of decomposition of the body.

(To be continued.)

FATAL CASE OF AORTIC ANEURISM IN A PREGNANT WOMAN.

AUTOPSY—REMARKS ON FŒTAL AUSCULTATION.

By FRANCIS ADAMS, M.D.

On August 28 my attention was directed by a young Medical friend to the case of an unfortunate female, about 40 years old, who in a fit of coughing had been seized with a discharge of arterial blood to the amount of about a pint. She stated, that for some time past she had suffered palpitation of the heart, along with orthopnoea, especially in ascending, an activity; otherwise, except that she appeared to be rather sanguine, she might be said to be in good health.

Examination with the stethoscope revealed little that could be called abnormal. Respiratory murmur at the upper part of the chest on both sides was nearly natural, or at most but slightly exaggerated. The heart felt as if agitated, but no bruit nor any other well-defined sounds of a preternatural character could be detected. In the back we fancied the sounds rather feeble, and the respiratory murmur indistinct on the left side. Pulse at both wrists about 70, without intermissions. No complaint of pain except in the back, opposite the heart.

She represented herself to be seven months gone with child; but careful auscultation, repeated separately once and again by myself and my assistant, revealed no sound which could by any fancy be construed into either a *placental soufflet*, or the beats of a fœtal heart. Yet the usual tumour of the abdomen in advanced pregnancy was present, and the breasts were turgid, along with a dark areola around the nipples. Notwithstanding the unsatisfactory results of auscultation, we therefore confidently decided that the woman was with child, and labouring under aortic aneurism. Accordingly, she had twice or thrice slight attacks of hæmoptysis at intervals of a few days, and during one of these she died suddenly, on the morning of September 7.

Autopsy next day.—In cutting through the ribs in front a great quantity of serum escaped, and when the thorax was laid open a very large coagulum of blood was found behind on the left side, which, it soon appeared, had escaped from

the bursting of an aneurismal tumour about the size of an egg-cup in the descending aorta two or three inches below its arch. Part of the blood had also made its way into the substance of the lungs. Opposite the tumour the edges of two of the vertebræ, probably the fifth and sixth, were rather deeply eroded, but the intervertebral substance was not affected.

It will at once be remarked, that, although the preliminary symptoms be somewhat different, the present case bears a close resemblance to that of the lamented Mr. Liston. In his case, however, owing to the tumour (if we recollect right) pressing upon the trachea, the difficulty of breathing was more urgent.

The results of a careful examination of the abdominal region need not be further gone into at present than to state that the body of a child about the seventh month of pregnancy, and quite fresh, was found in the uterus.

However, we cannot omit the present opportunity of saying a few words on what is usually denominated auscultation of the fœtal heart in pregnancy, and this we are the more induced to do in consequence of the attention of the Profession having been prominently directed a few weeks ago to the subject by a passage in one of Dr. Simpson's Lectures on the Diseases of Women, recently published in this Journal—papers, I hesitate not to say, more replete with the Medical learning of all ages and the extensive results of original observation than have appeared in this country for many years past.

Treating of the diagnosis in pseudocycosis, or spurious pregnancy, he expresses himself thus:—"Auscultation affords in pseudocycosis only negative results, or ought only to afford such. But I have seen more than one case of the disease in which the Practitioner—perhaps led astray by the strong assurances, and fervid belief of the patient herself—has imagined that he heard something like the sounds of a fœtal heart, where there was no fœtus present to produce any such sounds. Several years ago I had a lady placed under my care from a neighbouring part of the United Kingdom, in whom a Physician,—who had written a work, and a very excellent work too, on Auscultation in Pregnancy,—fancied he had heard, three or four months previously, the sounds of a fœtal heart; and, though all due preparations were made, no child was born."

The following narrative I had from a most trustworthy Physician in the North. He stated that when he was a Student of Medicine in Edinburgh, about eight years ago, he was attending a case of protracted labour in the Maternity Hospital there, and being anxious to determine whether or not the child was alive, he practised auscultation with negative results. But having called in the assistance of an older student, the Superintendent of the Institution, he at once detected (as he said) the sounds of the fœtal heart. Yet, when a few hours afterwards the delivery was completed, it turned out that the child was putrid, and must have been dead several days!

If time permitted I could mention, even within my own limited sphere of acquaintance, I know not how many instances in which auscultators pretended to detect the sound of the fœtal heart when there was no living heart to be detected, and, on the other hand, when (as in our present case) the most careful examination failed to detect the sound of a living fœtal heart in the uterine regions.

I am confident, therefore, that, at least in many cases, the fancied sound of the fœtal heart ought to be ranked among mental phenomena; and I have long been persuaded that these have not been properly studied and attended to in the practice of Medicine, or in other matters connected with science and the business of the world. Certain it is that, if on any occasion a person has an intense persuasion that he is about to see any peculiar sight, or to hear any peculiar sound, he will see and hear accordingly.

In my younger days it was the common belief, founded, it turns out, on the fanciful information of certain Arctic travellers, that the Aurora Borealis is always accompanied by a peculiar crackling, or as some described it, a hissing sound; and, at that period, namely, forty or fifty years ago, I have again and again, along with many other spectators, stood gazing at these Northern Lights, while one and all of us professed to have heard something like the sound in question—none, at least, had the courage to deny the fact. I need scarcely say that all the best authorities are now nearly or altogether unanimous in deciding that the supposed sound of the Aurora

is altogether an illusion or figment of the mind. (See Humboldt's "Cosmos," Vol. I. p. 194, and Vol. V. p. 157.) Accordingly, scarcely any person now-a-days pretends to hear the sound in question; or, if a few still stand out for the old belief, you will not find two people who will give exactly the same account of what the nature of the sound was which they pretend to have heard. This is also remarkably the case with regard to the sounds said to be distinguishable by the stethoscope in foetal auscultation. At first it was confidently affirmed that one hears 160 double beats (namely, a louder and a feebler set); that is to say, 320 pulsations in a minute! which is at the rate of about $5\frac{1}{2}$ beats in a second! Now, it is usually told, that one only hears 80 loud and 80 feeble sounds. At first, it was also confidently asserted, that one could always hear a loud bellows sound, which got the name of *placental soufflet*. Among auscultators, at present, some tell us they can detect the *soufflet*, but not the sounds of the heart; others, that they can detect the latter but not the former. Few pretend they can recognise both, at least in the same case.

I have often had occasion to remark, that in the examination of a case where scarcely any doubt can exist that there is a foetus in utero, success in detecting the sounds of its heart depends in a great measure upon the circumstance whether or not the auscultator believes that he ought to detect them. Not long ago, I examined an unquestionable case of pregnancy, along with a most intelligent Physician, who was greatly committed on the question; and the result was he felt confident that he could hear the sounds, but he entirely failed to make me hear them. Truly, faith, not only in religion, but in all the transactions of life, is a most wonderful phenomena of the human mind! A good many years ago, a very intelligent native of the Highlands, who, I am sure, would have scorned to tell a falsehood, gave me a very circumstantial narration of the vision of a funeral which he saw, when quite awake, on a moonlight night, and which was verified in all its particulars by the funeral procession which he actually saw, in broad daylight, a week afterwards. Having lately told this story to a most intelligent friend, a native of the same district of the country, he further stated that in his younger days, his father, a venerable man, of unquestioned veracity, had repeatedly assured him that he had frequently seen similar " unearthly sights." Indeed, except for their utter incredibility, and the absurdity of supposing that such spiritual phenomena should be confined to particular districts and individuals, no one would be warranted in refusing his assent to ghost stories, even as they are now attested.

I may here mention, that what first led me to entertain sceptical doubts on the question of foetal auscultation, was an examination into its merits, made with the aid of Hunter's Plates of the Gravid Uterus before me. I could not help being struck how utterly incredible it is, that, in almost every instance, the stethoscope could have been planted on the child's body, so that the sounds of the heart would be heard. For, surely, it will not be pretended, that the cardiac sounds can be distinguished if the instrument be placed on the right side, or on the shoulder and arm of either side, or on any part of the inferior extremities. But in addition to these obstructions, we must recollect that in almost every case the placenta—the uterus with its immense sinuses and blood-vessels—and also the abdominal parietes, with their blood-vessels, intervene between the feeble object in question and the ear of the auscultator. Now, that in pelvic auscultation, one occasionally detects pulsatory sounds and *soufflets*, may be admitted; but it remains to be proved that the former are the sounds of the foetal heart, or the latter of the placenta. However, when the observer has an intense impression that he ought to hear these sounds, he easily persuades himself into the belief that he has actually heard them. In conclusion, the following words of Baron Humboldt, on the Aurora Borealis, may be applied, *mutatis mutandis*, to foetal auscultation:—"The belief in a crackling sound has arisen, not among the people generally, but rather among learned travellers; because in earlier times the Northern Light was declared to be an effect of atmospheric electricity, and the observers found it easy to hear what they wished to hear."—"Cosmos," Vol. I. p. 195.

It is, in fact, a confirmation of the ancient aphorism: "Credunt quia credere volunt."

THE LONDON PRACTICE OF MEDICINE AND SURGERY.

ROYAL LONDON OPHTHALMIC HOSPITAL.

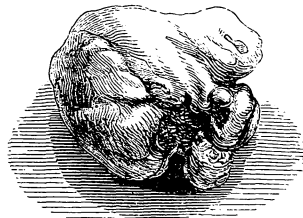

IVORY EXOSTOSIS GROWING FROM THE ORBITAL PLATE OF THE ETHMOID.—OPERATION.—RECO- VERY, WITH PERFECT MOTION OF THE EYE.

(Under the care of Mr. BOWMAN.)

J. L., 30, a wheelwright, was admitted under the care of Mr. Bowman, on the 12th of July last. The history of the case was as follows. Eight years ago he had some inflammatory affection of the chest (pneumonia?); shortly after which the left eye began to bulge, and the protrusion slowly increased. Five years afterwards he had abscesses in the jaw, thigh, and leg, and at the same time there was great redness of the affected eye, and he "could not work." When first seen, the following was the note made of the condition of the eye: "The globe is displaced outwards, and slightly advanced forwards. A hard rounded even tumour (bony?) is felt through the lids, and seems to spring from the lachrymal bone. Two nodules are clearly felt, one above and one below the tendo oculi. They are each about the size of a small bean. The caruncle is pushed forwards, and the conjunctiva is congested."

At the ophthalmoscopic examination, the optic nerve was seen to be as red as the rest of the fundus, and could only be recognised by the passage of the retinal vessels.

Its removal by operation was performed the same day. Chloroform was administered. Mr. Bowman first divided the upper lid by an incision, commencing internally at the tendo oculi, and prolonged upwards and outwards for about three quarters of an inch. This incision lay over the upper nodule of the tumour, which it exposed. On the supposition that it might possibly be an abscess or a cyst, an attempt was now made to puncture it, but without success, the tumour being evidently of a bony nature. It was broken away from the inner wall of the orbit by an elevator, the pedicle (by which it was afterwards proved to have been attached) being snapped off short. The mass was then easily removed. A small part of the pedicle still remained attached, about the size of a pea, and was clipped away with forceps.

The tumour represented in the engraving was a nodulated tuberous growth of solid bone; on section it was found slightly porous near the pedicle, but not cancellated, and in general exceedingly dense. It was grooved into a deep cleft above by the tendon of the superior oblique. On July 26 the following note of the case was made:—"The lids became greatly swollen after the operation, but this has now nearly subsided. The wound has closed, and sight is perfect."

Two months after the operation the optic nerve had resumed its normal pink appearance, and the eye-ball its natural position and function.

Instances of ivory exostosis growing into the orbit are so rare, that we are glad to be able to append the following description of one, from the Catalogue of the Museum of the College of Surgeons. Our attention was called to this case by Mr. J. Harle, a gentleman who was present at Mr. Bowman's operation:—

"795.—Portion of a skull with an osseous tumour. The tumour is of an irregularly rounded form, is deeply lobed and nodulated on its surface, and measures about two inches and a-half in its greatest diameter. It has, for the most part the hardness and apparent structure of ivory, but in its

central and posterior part is composed of very close cancellous tissue. It fills the frontal sinuses, and the upper part of the left orbit, encroaches into the right orbit, and projects for nearly an inch on both the outer and the inner surfaces of the skull. It appears to have originated in the ethmoidal cells, or frontal sinuses, and in its growth to have displaced and destroyed by pressure the adjacent parts of the outer and inner tables of the skull, and the inner wall of the orbit. On the anterior aspect two of its lobes have made their way through separate apertures in the outer table; the margins of these apertures are thin, and extended for a short distance over its surface. Just above the tumour, near the left temporal ridge of the frontal bone, is a small round flattened elevation of bone."—*Hunterian*.

This preparation is engraved in Baillie's "Morbidity Anatomy," fasc. x. pl. 1, fig. 2. See also Home, in the "Philosophical Transactions," vol. lxxxix, 1799, p. 239. "Catalogue of General Pathology," vol. ii. p. 172. The reference is to a paper as follows:—"Some Observations on the Structure of the Teeth of Graminivorous Quadrupeds; particularly those of the Elephant and *Sus Æthiopicus*. By Everard Home, Esq., F.R.S. Read May 30, 1799."

A foot-note to Home's paper, above alluded to, says,—“The tusks of the elephant are found upon a pulp, similar to teeth. Tumours are sometimes met with in the frontal sinuses of the human body, having a perfect resemblance to ivory. They have their origin in the bony cavity of the sinus, and extend themselves into the orbit of the eye. Of these, I have seen two instances, and was unable at the time to account for them; but am now induced to believe they were formed upon vascular excrescences, growing from the lining of the sinuses, similar in their organisation to the pulps above mentioned.”

EXOPHTHALMOS CAUSED BY FIBRO-PLASTIC DEPOSIT IN THE ORBIT.—EXTIRPATION OF THE TUMOUR, TOGETHER WITH THE EYEBALL.

(Under the care of Mr. BOWMAN.)

J. C., aged 13, of Hull, was admitted June 21, 1859. He was a weakly, pale-looking boy, of fair complexion. He lost his mother by consumption; his father was healthy, and his brother also. He first observed accidentally, fifteen months ago, that the right eye was slightly reddened, and appeared larger than the left. This apparent increase of size was due to protrusion of the eye, which had been more considerable some months ago than it was now. It has never been painful, and vision has remained good. On examination the right eye is found to be pushed forwards and downwards, so that its equator stands about in a line with the orbital aperture. There is a great deal of chemosis. The movements of the eye are free; no defined hardness or swelling can be felt behind the eye, but the orbital fat appears evenly pushed forwards. Mr. Bowman proceeded to operate the same day; chloroform was administered; an incision was made quite through the right upper lid from its outer margin to the upper edge of the orbit, next through the conjunctiva, through which latter incision the fat of the orbit immediately protruded. Some of it was removed. On examination with the finger an uneven granular mass, of cartilaginous consistence, was felt, occupying the depths of the orbit. Several pieces of this mass were removed, and the wound was closed by sutures. The tissue removed was found by microscopical examination to consist of numerous nuclei of pretty equal size, enclosed in loops and bands of fibrous tissue (fibro-plastic tumour).

July 11, 1859.—The exophthalmos has not decreased; there is still no pain, but there is abundant purulent discharge from the wound. The lower part of the cornea is ulcerating, there is pus in the anterior chamber, and the patient is feverish, restless, and drowsy towards evening. It was determined to operate again; chloroform was administered; the old incision was opened, the eye removed, and by scalpel scissors and scoop the fibro-plastic mass was removed up to the optic foramen. Some of the mass could be felt attached around the optic foramen. The wound was plugged with cotton wool soaked in perchloride of iron. No pain followed, but there was a great deal of purulent discharge, and infiltration of the lids. He left the Hospital on July 29, the chemosis had subsided, the lids had sank back. There was still some purulent discharge. No brain symptoms have appeared since the operation.

THE LONDON AND PROVINCIAL PRACTICE OF MEDICINE AND SURGERY.

COMMENTS ON TRACHEOTOMY FOR SCALDS OF THE GLOTTIS.

We have in the annexed table fourteen cases, the patients ranging in age from twelve months to five years. Eleven of the cases ended in death, and only three in recovery. In one of the cases which recovered (Case 3) from certain peculiarities in the history there is quite room for doubt as to whether the boiling water had ever reached the glottis. In the other two instances of recovery, however, the conditions present were urgent, and had steadily developed from the time of the accident. In these three cases the age of the patient was respectively a year, two years and a-half, and three years. It would appear that when cases do well after tracheotomy for this accident that the restoration of a healthy condition of the laryngeal mucous membrane is rapid. In one the canula was kept in for six days, in another for five, and in a third for three: in all, the wound healed perfectly within a short time. The exact time subsequent to the accident at which the operation was performed is not stated in all the cases; but in most of them it was from four to seven hours. In one it was only an hour and a-half, and in another it had extended to seventeen hours. In nearly the whole of the cases the reports show that great relief followed the operation. In most of the fatal cases the children lived for at least a day or two subsequent to its performance, while in all it is expressly stated that at the time of its adoption the symptoms were those of impending suffocation. In one case (Case 14) it would seem that the immediate cause of death was the unexpectedly severe action of mercurials. Of the fatal cases, the average duration of life after the operation is about three days. In one, life was protracted to the fourteenth day, and the fatal event was due to an attack of acute pneumonia, which did not set in until the seventh day, when the child had appeared out of danger. In only three cases out of the eleven did the child die within twenty-four hours of the operation. The accounts of the post-mortems are in several instances imperfect. In three instances (Cases 1, 10, and 11,) there was acute broncho-pneumonia. In a fourth (Case 13) the mucous membrane of the trachea was livid, inflamed, and the lungs congested. In Case 2, death occurred in collapse, and was probably induced by the hæmorrhage which had taken place during the operation; and in Case 9, as the child only lived a few hours it is probable (though not expressly stated) that the cause of death was collapse, rather than extension of inflammation. An interesting comparison might be made between this group and those for croup and for foreign bodies. They have this in common, that in all the subjects of the operation were children. It will be seen that the fatality after tracheotomy for scalds of the glottis is much greater than when the same operation is performed in patients of about the same age for foreign bodies in the trachea. With regard to operations for true croup, as compared with those for scalds, the fatality appears to be pretty nearly the same. In the one group we have fourteen cases and three recoveries, in the other, fourteen cases and four recoveries. It might *a priori* have been expected that the advantage would have been considerably in favour of the operation when done for scalds. In the latter, although acute local inflammation is often present, yet the Surgeon has not, as in the case of croup, a specific constitutional malady to contend against. According to our series, as just stated, there is, however, no great difference; but it is not improbable that if more extended collections of cases could be got together, that a somewhat dissimilar average would be obtained.

COMMENTS ON TRACHEOTOMY FOR CROUP.

We have in this table fifteen cases, with four recoveries and eleven deaths. The ages of the patients who recovered were six years in two cases, in one five years, and in one four. It singularly happened that all the cases of recovery occurred in one Hospital. Of the fatal cases, most of the patients were considerably younger than those which recovered, a result, we

believe, which is always apparent in the examination of the statistics of tracheotomy for croup. In the whole of the cases the operation was resorted to as a last resource, and under extreme conditions. In two of the fatal cases the age is not stated. In one it was sixteen years, in one ten, in one eight, in one four, in two three, in one two, and in the remaining two fourteen months. In one of these (Case 10) the patient did well until the thirteenth day, when a relapse of croupal inflammation occurred. In almost all the others death occurred within a few hours of the performance of the operation, thus affording a considerable contrast with what we showed to have been the result after tracheotomy for scalds of the glottis. In one of the cases death occurred during the operation from the

accidental entrance of blood into the trachea; and in another it was due to the accidental plugging of the tube by false membrane, at a time when Surgical assistance was not at hand.

The various details of the question as to the propriety of tracheotomy in croup, as to the best mode of performing the operation, and as to the treatment subsequent to it, have been so often discussed in our pages within the last few years, that we need not do more than offer the above brief synopsis of the group of cases now before us. Much excellent practical information respecting it will be found in the admirable "Memoirs on Diphtheria," recently issued by the New Sydenham Society, to which we may venture to direct the reader's attention.

TABULAR STATEMENT OF FIFTEEN CASES OF TRACHEOTOMY FOR CROUP.

No.	Hospital and Surgeon.	Sex.	Age.	Duration of Disease.	Patient's State.	Operation.	Constitutional Treatment.	Result.	Autopsy.	Remarks.
52 1	St. George's.— Mr. Tatum.	M	6	Six days.	Great debility and urgent dyspnoea.	Blood flowed into the trachea during the operation, and produced urgent symptoms of suffocation.	Had been "actively treated."	Recovered.	—	Pieces of false membrane passed by the tube.
53 2	„ House-Surgeon.	F	16	—	—	Death took place on opening the trachea, supposed to be due to entrance of blood. The isthmus of the thyroid had been divided.	—	Died during the operation.	Extensive pneumonia.	
54 3	„ Mr. Pollock	F	6	—	—	Tracheotomy.	—	Recovered.	—	
55 4	—	M	—	—	—	Tracheotomy.	—	Died.	—	Death followed in a few hours.
56 5										
57 6										
58 7	Dreadnought Hospital-Ship.— Mr. Corner.	M	4	Three or four days.	In the last extremity. Previously a fine healthy child.	Large solid piece of fibrine removed.	—	Died.	—	He did well for an hour and a half after the operation, and then died very suddenly.
59 8	The Metropolitan Free Hospital.— Mr. Hutchinson.	M	8	Eight days.	Dyspnoea urgent	Pulse and respiration had ceased before the completion of the operation, but in a few minutes returned by the aid of artificial respiration.	—	Died.	Not obtained.	Died rather suddenly sixteen hours after the operation, apparently from firm clogging of the tube with mucus.
60 9	Hospital for Sick Children.— Mr. Chippendale.	F	14mo.	Two days.	—	Tracheotomy.	Not actively treated.	Died in convulsions sixteen hours after.	False membrane were seen extending into the bronchi.	
61 10	„ Mr. Athol Johnson.	—	2½	—	Urgent symptoms.	Tracheotomy, with great temporary relief.	—	Died.	False membrane were found more or less lining the air-passage from the larynx to the second and third division of the bronchi. The lungs were congested, and also emphysematous. Some patches of pulmonary collapse.	
62 11	„ Mr. Chippendale.	M	3	Five days.	—	Tracheotomy.	—	Died on the thirteenth day after sudden depression.	Ulceration of the trachea from the second ring to within an inch of its bifurcation.	The tube had been removed three days before death.
63 12	King's College.— Dr. Todd.	M	10	Eight days.	Dyspnoea threatening immediate suffocation.	Tracheotomy, with great temporary relief.	—	Death five hours after the operation.	A continuous coating of false membrane was found in the trachea, and extending to the minute bronchi.	
64 13	The Middlesex.— Mr. Moore.	—	3	One day.	Dyspnoea urgent	Tracheotomy.	—	Death.	—	
65 14	St. Mary's.— Mr. Ure.	—	13mo.	—	—	Tracheotomy.	—	Died in a few hours.	—	
66 15	Addenbrooke's Hospital, Cambridge.—	M	4	—	Urgent and alarming dyspnoea.	Tracheotomy.	Chloroform did not relieve the dyspnoea.	Recovered.	—	It was necessary to use artificial respiration. The boy recovered quickly.

TABULAR STATEMENT OF FOURTEEN CASES OF TRACHEOTOMY FOR SCALDS OF THE GLOTTIS.

No.	Hospital and Surgeon.	Age & Sex.	Time elapsed between Accident and Operation.	Symptoms.	Operation.	Results.	Remarks.
38 1	Guy's.—Mr. Birkett.	3½ —	Seven hours.	Distressing dyspnoea.	Tracheotomy.	Progressed favourably for a week, and then died rather suddenly.	Post-mortem examination revealed acute pneumonia.
39 2	„ Mr. Callaway.	3 M	Eighteen hours.	Almost dead from dyspnoea.	Tracheotomy. Probably hæmorrhage (into trachea?)	Never rallied: died nine days after the operation.	
40 3	„ Mr. Callaway.	1 —	Three or four hours.	Symptoms of laryngitis suddenly supervened.	Tracheotomy. Great relief.	Recovered.	Canula removed in six days.
41 4	„ Mr. Callaway.	3 M	Seven hours.	Urgent dyspnoea.	Tracheotomy. Immediate relief.	Recovered well.	
42 5	„ Mr. Birkett.	2½ M	Seven hours.	Suffocation impending.	Tracheotomy.	Recovered.	The child had suffered from whooping-cough, which returned severely after the operation.
43 6	The London.—House-Surgeon.	1½ —	—	Intense dyspnoea.	Tracheotomy. Great relief.	Died in twenty-four hours.	Autopsy.—Epiglottis charred and shrivelled, and great œdema of the glottis.
44 7	„ Mr. Wordsworth.	4 —	Five hours.	Dyspnoea.	Tracheotomy. Great relief.	Dyspnoea returned, and death took place in fifty hours.	Autopsy.—Charring of the glottis and epiglottis, and collapse of parts of the lung.
45 8	„ House-Surgeon.	2½ F	One and a-half hours.	—	Tracheotomy.	She did well for twenty-four hours, when symptoms of bronchitis set in, and proved fatal in eighteen hours.	Autopsy.—The larynx only examined. Its mucous membrane was found inflamed and swollen, so as to obstruct the rima glottidis.
46 9	St. George's—	5 F	—	—	Tracheotomy.	Died in a few hours.	
47 10	St. Bartholomew's.—	3 —	—	Dyspnoea.	Tracheotomy. Great relief for some hours.	Symptoms of acute bronchitis set in sixteen hours after the operation, and death followed in eight hours more.	Autopsy.—Extensive injury about the glottis and pneumonia.—See Case 47, p. 360.
48 11	Staffordshire General Infirmary.—House-Surgeon.	2 —	—	Suffocation imminent.	Tracheotomy. Great relief for two days.	Death on the fourth day.	Autopsy.—Acute softening in the right lung and about its root.
49 12	The Middlesex.—House-Surgeon.	2 F	—	Dyspnoea.	Tracheotomy, with relief.	Death from exhaustion in thirty hours.	
50 13	St. Mary's.—Mr. Spencer Smith.	3 M	Seventeen hours.	Urgent dyspnoea.	Tracheotomy. Immediate relief.	Death in thirty-six hours.	Autopsy.—Epiglottis thickened, and, with the neighbouring mucous membrane, coated with lymph. Lungs congested.
51 14	King's College.—House-Surgeon.	3½ M	Twelve hours.	Unable to speak or swallow.	Tracheotomy.	Died. The respiration was almost natural from the time of removal of the canula (fifth day) until death, which appeared to be from exhaustion.	At the autopsy, the larynx was found to have quite recovered from inflammation, and there was no evidence of bronchitis.

THE COLONIAL PRACTICE OF MEDICINE AND SURGERY.

SYDNEY INFIRMARY, NEW SOUTH WALES.

POPLITEAL ANEURISM—AMPUTATION— HÆMORRHAGE—LIGATURE OF EXTERNAL ILIAC —REPEATED HÆMORRHAGES—RECOVERY.

(Communicated by Mr. ALFRED ROBERTS.)

J. M., aged 40, admitted December 18, 1858. Is a native of England, but has resided in this country for the last six years; of late has followed the occupation of wood-cutter. Is married; has generally enjoyed good health, and cannot afford any history of illness of himself or family having an especial bearing upon his present disease. He states, however, that in following his occupation, he has often made sudden jumps to get clear of falling timber, and has frequently lifted heavy weights. Five weeks since he first observed that his left foot and leg swelled slightly without pain, stiffness of the limb came on a few days after, and was followed in a few more by pain in the popliteal space. About sixteen days ago he first observed a small tumour in this region as large as a small pigeon's egg, which, with the pain that accompanied it, increased rapidly, until the date of his admission, and obliged him to take to his bed seven days since. Fomentations have been freely applied to the affected part, but with this exception no treatment appears to have been adopted.

When admitted, I noticed him to be rather a tall, well-

proportioned man, looking about 35 years of age. The thorax is full; lungs healthy; but the heart's action is nervous and tumultuous; countenance indicates acute suffering, but is otherwise healthy; muscular system is fairly developed. In the left popliteal space is a large, rather diffused, and strongly pulsating tumour, the action being so great in it as to convey to the applied hand the sense of a thin walled, tense cavity, containing a thick fluid; the femoral arteries of both sides are very superficial, hard, and cord-like; they very readily glide from under the finger when pressed upon. The entire limb was covered with wadding and carefully bandaged, pressure being applied to the femoral artery by means of Carte's pelvic and thigh compressors. This treatment was continued for three weeks, at the end of which time, and in spite of every precaution, a small superficial slough appeared under the compressing-pad. Up to this period the treatment seemed likely to prove successful; the swelling had discontinued to increase in size and become very perceptibly more solid in its character, but the continuance of the intense pain rendered the patient both restless and irritable. During the next few days pressure was continued as much as possible, though not constantly.

January 12.—After an attack of shivering, the integuments over the swelling were found to have taken on inflammatory action and to threaten immediate suppuration or sloughing. Amputation of the middle of the thigh was performed by the outer and posterior flap method. The femoral artery was found cut directly across in the lower flap, and to have its coats very thick; three other vessels were ligatured. On examination, the disease proved to be diffuse popliteal aneurism; the artery appeared expanded suddenly, and on one side only, into a capacious sac, the walls of which soon overlapped the aperture into the vessels both above and

below. As far as I could judge, about one-half of the tumour was covered with the expanded tunics of the artery, the remaining portion being bounded by morbid deposit only. I believe the femur was denuded of periosteum, about the internal condyle, and the joint was filled with dingy-coloured fluid; but these points are not in my notes. On the morning of the tenth day after the operation, everything promised well, except that I remarked his pulse was irritable. In the evening two severe gushes of arterial blood issued from the wound of the stump, and rendered further measures promptly necessary. After a consultation with my colleague, it was decided to tie the external iliac artery, and I proceeded to this step at ten p.m. The integuments and tendinous structures, etc. were divided, the peritoneum was detached, and the sheath of the vessels made out without much difficulty; but in opening the latter a small vein was divided, which lay diagonally across it; it gave, however, little trouble. The sheath was cautiously opened for about one-quarter of an inch, and the unarmed aneurism needle was passed carefully under the artery from within—the point being liberated from a thin layer of cellular tissue which covered it, by the edge of the finger-nail. About three seconds afterwards, while feeling the effect of pressure upon the vessel as it passed over the needle, I felt a pulsating whiz of blood under my finger, and became aware that the artery had given way. Fortunately the hæmorrhage was readily commanded by one finger, while the needle was promptly armed by a stout double ligature and withdrawn, one of the threads being firmly tied. This failed to arrest the hæmorrhage; and I again passed, with all gentleness, the aneurism needle, somewhat higher up; but the vessel gave way in a fresh spot, apparently opposite the aneurism needle. Determined not to pass the needle a third time unless absolutely necessary, I again threaded and withdrew it; one thread was now carefully tied as high up as possible, but failed in arresting the hæmorrhage. I now took the remaining silk and insinuated it, with the greatest care, higher up beneath the vessel, and secured it. This fortunately arrested the bleeding, and the patient was left comparatively quiet and comfortable. Chloroform was not given, and but little blood was lost comparatively. On the following day he was comfortable, and continued so until the tenth day after the operation, when the pulse having again become irritable, active arterial hæmorrhage occurred from the iliac wound. It was commanded by digital pressure directly above the wound, and an attendant was kept at the patient's side for this purpose, to be relieved at intervals day and night.

Feb. 2.—Blood still oozes from the wound, if the pressure is remitted for a few minutes.

3rd.—Hæmorrhage recurs, if pressure is removed.

4th.—The same.

5th.—No bleeding has occurred since yesterday, although I observed that the attendant applying the pressure has become listless and careless; the pulsation in the femoral is decided, but very feeble.

7th.—The same; the ligatures consisting of one loose, and three knotted, came away in the dressing.

8th.—Not so well; loss of appetite and vomiting; no hæmorrhage.

10th.—Countenance better, but vomiting continues at times; no hæmorrhage.

11th.—Doing well.

17th.—Doing well; the iliac wound is healed with the exception of a limited sinus in its centre, from which the ligatures were taken, and whence a grumous purulent discharge has lately issued rather freely.

18th.—At 8 a.m. a free and perpendicular jet of arterial blood issued from the arterial wound. When I saw him at 9 a.m., comparatively slight pressure commanded the bleeding, and at the same time allowed the femoral to pulsate. A copious semi-digested stool passed half-an-hour after the hæmorrhage.

19th.—A fresh jet of blood occurred to-day, but was easily commanded by pressure as before.

March 11.—A similar jet of blood occurred, but was more readily subdued than on the former occasions.

April 26.—Up to this date there has been no further bleeding; the wounds are healed, and the man sits up in bed.

June 1.—The man has been discharged in excellent health.

SATURDAY, OCTOBER 22.

HOW OTHERS SEE US.

SOME of our daily contemporaries, in commenting upon the various Opening Addresses delivered this year at Schools of Medicine in London, have committed a few egregious blunders. They have, in fact, written much after the fashion that Frenchmen follow when they indulge in the expression of their opinions on England or the English. So long as they keep to matters upon which they are capable of giving a rational opinion, they write reasonably enough; but when their folly and their pride lead them into the absurdity of discussing points quite beyond their record, then they naturally talk nonsense. We have been struck with this on reading one of these articles in particular; for amidst a great deal of erroneous conclusions and assertions, we find thrown out a hint or two that may be worthy the attention of the Profession.

Notice has been taken of the high tone and noble sentiments expressed by the Lecturers on this occasion; and the hope is earnest, that the beautiful ideas thus theoretically declared as befitting the honourable scions of Medicine, may one day blossom into fruit. Some cannot, however, help sighing, when listening to these aspirations, and looking about into the realities of Medical life, they find, by sad experience, such dissonance between what is taught thus mellifluously, and what is practised so extensively.

Of course our critics indulge in the old strain so often piped against Medicine,—its uncertainties, and its varieties, its multitude of systems, and its innumerable creeds. Of course, also, it is easy enough to magnify the mists which hang around our Profession; and we may readily excuse sick people for being angry if the Doctor cannot cure their incurable diseases. But we beg to tell these critical gentlemen, that the public, and not we, are accountable for all the numerous shapes of funny creatures which are continually being generated, springing up like mushrooms, in a super-excited society, and assuming the titles of diseasers. It is not *our* fault if the Profession is a "swarm of sects" in the eye of the Public. In our eye the Profession is still the Profession—one and indivisible. There is but one clear, upright, and honourable path for the man of honour and the legitimate man of Medicine to follow. He never deviates from it. Homœoquacks, Silent Friends, Kinesipaths, Mesmerists, Hygeists, Nervo-Arterial Essentialists, and such-like gentry, have nothing to do with Medicine, and if the Public choose to consider them as such, surely it is not to the blame of the Profession, which repudiates the whole batch.

Then, again, to accuse our Profession of being full of uncertainties—why, what is this, but to accuse it of being human? Is the Law more full of assurances—the glorious, *uncertain* Law? Of Theology we will say nothing but this: That every sect gets certainty only after its own fashion, and

leaves the other thousand sects shrouded in mysterious doubts, or plunged in reckless ruin. And the soldier, too, what certainty does his Profession bring? Who knows when he goes out to battle, whether he shall destroy his enemy or be starved by the faulty arrangements of his own Staff?

And further, to say that the Medical Profession lags behind all other Professions, is to say what is utterly untrue. We, who know what Medical Science is, affirm that Medicine has, within the last few years, made immense strides towards a right comprehension of the nature of diseases, and, consequently, to a truer comprehension of their right treatment. We have begun to learn what we can and what we cannot do—have begun to exercise our talents in their most legitimate field of operation. Medicine lagging behind! Why, who were they who taught the immense science of preventing and anticipating disease? Who have always stood at the head of every social movement which had for its object the arresting and preventing the origin of diseases? Can it be denied, that through Medical Science, thus legitimately developed, thousands of lives are daily saved from death or mutilation—simply by the application of preventive means? Where, before, in the history of the world, can Medicine be found acting this advanced part of a guardian and anticipating angel on so magnificent a scale as at this moment? Surely it is something to have proclaimed widely to the world, that the power of Medicine in preventing diseases is unbounded.

Another cause of complaint against the Profession is founded in this, that the standard of Medical education is low. Now on this point, also, we need hardly say that the complainant is unjust. For upwards of twenty years past incessant efforts have been made to elevate the standard of professional knowledge; and everyone acquainted with Medical life knows well that a class of men are now turned out every year, from the Schools of Medicine, differing vastly from, and infinitely superior to, the Medical man of other days. Besides this, the advance of education is still going on—and every year the student finds that more knowledge is required of him than was required of his predecessor. It, of course, cannot be pretended, that when a man goes forth direct from his studies into practice, he invariably possesses that high knowledge which is desirable. We may grieve over the fact, if we please, that a young man thus legitimately made a Practitioner of Medicine should at once have placed in his hands the lives of individuals; and we are willing to admit that the first years of a young Practitioner's life must be passed in gaining that knowledge which we should have desired him to possess at the very commencement of his Professional career. On this head, we really believe that much improvement might be made, if only what are considered the rules and dignity of the Profession would admit, for once, of the right men being put in the right places. Let us explain. We gladly touch upon the subject to which we allude, because we know that it is closely connected with the possible abatement of that monster Professional evil—to which we have often called attention—**Gratuitous Medical Services.**

The complaint to which we have referred is this: that young and inexperienced men, often undertake the treatment of serious diseases, in the middle class of society. We think the complaint not altogether ill-founded; and we certainly say that it is a misfortune in the etiquette of Professional life which prevents more experienced men from undertaking the treatment of such cases. Just let us look around, for instance, in this metropolis, and see the amount of really high Professional knowledge which is absolutely wasted for want of objects on which to exercise itself profitably. Now, it is quite evident, that if the rising Surgeon, or rising Physician—we mean the men who have so

used their time and talents as to have given them the rank of Hospital men—would undertake the duties of a “family doctor,” that both they and the public would be infinite gainers. The Physician or Surgeon here spoken of, sees the young men whom he has himself taught the Art of Medicine, rising up, as General Practitioners, to fame, and the possession of a large practice, while he still remains a mere expectant waiter upon the honours of the future. Is this not highly absurd? That his knowledge and power of treating disease is infinitely superior to that of the youthful Practitioner, is manifest; why then should etiquette prevent him turning these talents of his to a profitable account, and so much to the benefit of society? Numbers of persons rush to Hospitals in order to get advice of senior men, who would gladly pay for the same if they could procure it at a price equal to their means.

Now, we boldly ask in all common sense and reason, *Why in such a case* should the Physician or the Surgeon act the superb part and say, “No, if you cannot pay a guinea, you must come to me at the Hospital, or you must go elsewhere for cheaper advice”? Or, again, look too at the gross injustice of the thing, not only as regards the Profession, but also as regards the class of patients spoken of. You actually prevent those who are willing to pay according to their means from obtaining a high kind of advice. You say, “You are not a pauper, and therefore must not go to an Hospital;” the consequence is that the patient goes to some prescribing Druggist, or patronises some patent medicine. Here, then, is the case,—you place this class of persons in a worse condition than the pauper. To the pauper you give this high professional advice; to this class you say, Because you cannot pay much, you shall have none of our advice. And see what happens. You drive these people to the Hospitals; you pauperise them even though willing to pay; and you thus accumulate the abominations of Gratuitous Medical Services. We have now touched on this subject; but we shall not let it rest here. We trust that the feelings and sympathies of a large class of our Professional brethren will go with us and enable us to bring some fruit to ripeness out of this discussion.

THE WEEK.

In reply to a note published a fortnight ago we have been requested to publish the following statement:—

“On January 6, 1857, Dr. Tanner was consulted by Mrs. B., aged 38, on account of a tumour in each mammary gland. The patient was married, and had been pregnant three times. On the first occasion she aborted; on the second craniotomy was had recourse to at the full term; and on the third premature labour was induced at the seventh month, but the child only lived a few days. The last labour was five years ago. On examination Dr. Tanner found a tumour in the right mamma, the size of a hen's egg; it was freely movable, rather hard, but not at all painful, and was accidentally discovered four months ago, since which time it has not increased in size. In the left gland there was also a small tumour, the size of a filbert, which was painful; it had existed four years. Dr. Tanner's diagnosis was chronic mammary tumours; he advised that they should be left alone, and stated that they were not cancerous. Ordered alteratives and cod-liver oil. On March 10, 1857, the patient again saw Dr. Tanner, who found that the tumours were in the same state as in January; though the patient said the one in the right breast was much larger. As Mrs. B. was anxious to get rid of them, she was told that they might with safety be removed by the knife if they were painful or troublesome. Without seeing Dr. Tanner again, the patient put herself under the care of Dr. Fell, who stated that the tumour in the right breast was a cancer. On May 16, 1857, this gentleman commenced its removal by applying caustic. In six weeks the mass came away; but three or four more weeks elapsed before the part healed. ‘During the process of burning it was very great agony,’ according to the statement of Mrs. B. About the middle of August the patient had severe pains in her right side, which soon affected the shoulder, arm, and hand. Dr.

Fell prescribed an ointment for neuralgia, and warm sea-water baths. About the end of September 'she could not keep anything solid on her stomach, and could take nothing but arrowroot, brandy-and-water, and such like.' Her sufferings continued to increase, and were 'at times dreadful, the neuralgic pains extending from her neck to her knees, and sometimes would attack the head. They continued till within a few days of her death, which took place January 15, 1858.'

The answer, which we last week gave to a correspondent, who enquired what was being done at the College of Physicians of London respecting the election of Fellows, seems to us to be fully verified. We have seen a list of the newly proposed Fellows; and think that the Council in their selection have fully entered into the liberal feelings manifested by the Fellows themselves. The Council could not alter their former—the rejected—list, so that the names on that list and on the new one will now go to the Fellows for ballot on the 22nd inst. (this day).

Our French brethren can't understand the English method of using opium, calomel, and antimony. Mercury as an *alterative* (let the term signify what it may) is with them a medicament unknown. They are astonished at the skill and audacity which we employ in giving large doses of opium. "If," says one public writer, "we were to take from the English Physicians their opium and their calomel, they would have to renounce the practice of medicine." M. Girard Teulon exclaims at the incomprehensible fact of English Surgeons attacking stricture of the urethra by opium, *i.e.*, their commencing with the opium instead of the bougie. However, as he very sensibly remarks, when a whole nation systematically carry on the same sort of practice in dealing with opium, calomel, and antimony, it is worth while that we should consider whether it may not have some goodness in it. In compliment to our neighbours we beg to rejoin that on similar principle, we on this side the channel, seeing that they systematically cure or treat their patients without the continual and daily application of these articles, and we must suppose satisfactorily treat them, ought reasonably to consider whether it be not possible that we use them more frequently and more extensively than is good for the patient who is subjected to their action.

A correspondence has lately taken place between Mr Griffin, of Weymouth, and the Poor-law Board on the subject of the appointment of non-registered Practitioners as Poor-law Medical officers. Mr. Griffin has discovered that certain gentlemen now hold office under the sanction and by the authority of the Poor-law Board, but whose names are not to be found in the columns of the Medical Register. He accordingly furnishes a list of these gentlemen to the Poor-law Board, and he points out that under one of the well-known provisions of the Medical Act "no person shall hold any appointment as Physician, Surgeon, or other Medical officer, in any Union Workhouse, or Poor-house, or Parish Union, unless he be registered under this Act." The terms of the Act are so explicit, that the matter appears to admit of no doubt whatever; nevertheless, we find, that although Mr. Griffin's letter was addressed to the Board on the 27th of September, no answer was received until the 15th instant, and the purport of the reply is to the usual effect, that "the Board will make inquiries." It must be added, however, in justice to the Board, that they expressly state the necessity which every Poor-law Medical officer is under, of declaring the fact of his registration to the Poor-law Board at the time of his appointment. If the gentlemen in question, therefore,

have stated what was false, it is clear that their conduct was highly censurable, and their appointments are forfeited; but as the Board have promised to "make inquiries," we must wait for the result of their investigations. To persons not versed in the red-tape system of official routine, the case seems plain enough; if the gentlemen named by Mr. Griffin are on the Register, their names will at once be found there; but if they are not on the Register, their appointments are clearly illegal. Still, the Board may prefer a more circuitous process for discovering the fact than that which we have just indicated, and we feel secure that if they do not arrive at some conclusion within a reasonable time, Mr. Griffin, their faithful monitor, will not fail to stimulate their inquiries by jogging their recollections.

We are sorry to find that there exists, in certain districts, a disposition to neutralise the good effects which the Legislature intended to produce by the appointment of Medical Officers of Health in the metropolis and throughout the country. By the Act of Parliament, the various Boards of Works in the metropolitan districts are empowered to appoint Medical Officers of Health, but the Act does not define the duties of those functionaries, nor does it in any way allude to the salaries to be awarded to them. Hence it has happened, that in some localities the Act has been interpreted in a very narrow spirit, the duties of the Medical officers have been unduly curtailed, and the salaries have been fixed at so low a rate as to render them almost unworthy of acceptance. In some instances, the existing salaries have been largely reduced, in others unsuccessful attempts have been made in the same direction; and we have heard that on a recent occasion, when a vacancy occurred, it was seriously contemplated not to fill up the vacancy at all, or, at all events, to reduce the duties and the salary to so low a scale as to render the office useless to the public, and worthless to the person appointed. It is very much to be regretted that such false notions of economy should prevail in any of our Local Boards, for there can be no doubt whatever that the duties of the Medical Officers of Health are of a most important character, and ought to be remunerated accordingly. It may, indeed, appear that the labours of these officers are not of such a prominent character as those which fall to the lot of the great majority of our Profession: but it must be remembered that the object proposed in the institution of the new office is the *prevention* of disease; and if, by timely measures, the outbreak of epidemic maladies can be checked or controlled, surely the officers who are appointed as the preventive force are entitled to as much gratitude as those who labour among the sick while an epidemic is actually raging. The science of Preventive Medicine is still in its infancy, and it will be a subject of deep regret if its development should be arrested or retarded by the prejudices of those who are appointed to promote its advancement.

A case of very considerable importance was tried under the Medical Act last week, at Kingston, before the Borough Magistrates. Mr. Gould, one of the magistrates of the borough, and a former Mayor, is a Chemist in the town. He has on his door-plate "Surgeon and Mechanical Dentist," and he was prosecuted by the Medical Registration Association for assuming the title of Surgeon, not being registered as such according to the Act. It was proved in evidence that a woman went to Mr. Gould, complained that she had hurt her elbow, and paid him for some liniment which he gave her. She swore distinctly that she believed Mr. Gould to be a Surgeon as well as a Dentist; that she *separated* the words on the plate, and believed him to be both. She also swore that

she went to him because she thought she would get something cheaper at a chemist's than at a doctor's, but that she would not have gone to him had she not believed him to be a Surgeon. Mr. Gould held himself out as a Surgeon AND Mechanical Dentist, and the woman very naturally thought that he was both Surgeon and Dentist. Now, according to the Act, any one who shall "wilfully or falsely pretend to be, or take or use the name or title of Surgeon," subjects himself to a fine. The simple question then for the magistrates was, Did Mr. Gould use the title of Surgeon? It is so clear from his own door-plate that he did, that it is surprising any doubt could have arisen, or any necessity for proving that he had treated a surgical case. He "took and used" the title of Surgeon. He did not call himself Surgeon-Dentist, but Surgeon AND Mechanical Dentist. It is to be regretted that the simple issue was not tried on the door-plate. As it was, the questions of the title of Surgeon-Dentist, and the right of Druggists to prescribe for those who choose to trust them, were raised, and the magistrates were embarrassed by too many knotty points at once. We have not a shadow of a doubt that the decision is contrary to law and to the facts of the case. The magistrates dismissed the summons; but we trust that an example will be made of Mr. Gould. A man who insists upon his right to call himself SURGEON must be taught that he does not acquire that right by adding any other title to it. If there be any meaning in words, a "Surgeon and Mechanical Dentist," is both a Surgeon and a Dentist.

REVIEWS.

On the Minute Structure and Functions of the Spinal Cord and Medulla Oblongata; and on the Proximate Cause and Rational Treatment of Epilepsy. By Professor SCHROEDER VAN DER KOLK. Translated from the original (with Additions from MS. Notes by the Author) by WILLIAM MOORE, A.B., M.B., for the New Sydenham Society, London.

SINCE the time (1811) when Sir Charles Bell first took the initiative in these researches, and made known his interesting discovery that the anterior and posterior roots of the spinal nerves possessed distinct functions, not only have great advances been made in our knowledge of the more minute structure, and of the functions in detail of several parts of the spinal cord, but the doctrines regarding the nature of diseases connected with the cord and nerves have been so greatly modified, that our information on these topics may be said to be at this moment in a transition state. We advance in the right direction, however, by observation and experiments on living animals, associated with minute microscopic investigations into the structure of the cord. The inquiries into the structure of the cord, into the arrangement of its minute component parts, and their connexions with each other—with the brain on the one hand, and with the different parts of the body on the other—have been lately investigated with every appearance of success. Our Author, Schroeder Van der Kolk, with our countryman, Dr. Lockhart Clarke, stand first in the list of patient and laborious observers. Difficulties of the most formidable kind surround the anatomical, physiological, and pathological investigations of the spinal cord; for not only is much labour required in the first instance to expose the cord *in situ*, either in the dead or in the living body of any animal, but to examine it with any degree of minuteness in its healthy or morbid state, requires much care and time—the exercise of most delicate manipulation and perseverance in prolonged and most unwearied research. The last half-century has fully shown that the more we know of the structure of the cord, the more extensive, interesting, and important does the field of investigation become,—and, still more do we desire to learn. The research of the present day, as represented in the work before us, is of the most inquisitive kind, into the minute structure, connexions, and arrangements of the component parts of the spinal cord. It has been prosecuted, not only by Van der Kolk, but also by Dr. Lockhart Clarke, Drs. Todd and Bowman, in our own country; and by Kölliker, Hannover, Valentin, Stilling, Remak, Engel,

Volkman, R. Wagner, Budge, and Schilling on the Continent. An account of what each of these investigators has done, has been admirably given by the author of the work before us, while the spirit of the writer, as manifested in his criticisms on the works of his fellow-labourers, is characterised by much candour and generosity, while those points on which he differs from them are clearly and boldly stated.

We are greatly indebted to the Sydenham Society for this work, for it is not a mere translation of the Essay of Van der Kolk on the spinal cord, but the author and translator have so worked together that a new work has actually resulted, with a large amount of additional matter, together with alterations of two or three portions of the original, in reference to which the views of Van der Kolk have undergone some modification. The work especially aims at the elucidation of that mechanism displayed in the construction of the spinal cord, by which the co-ordination of movements is provided for. The influence of the corpora olivaria in the articulation of words, and on the variety of lesions of speech which accompany morbid affections of different parts of the brain and medulla oblongata, are illustrated by some interesting observations. He notices also the intermittent character of many convulsive and neuralgic attacks, which, being nevertheless the result of intense organic disease, are calculated to afford much important aid in diagnosis.

Some interesting measurements have also been made of the diameters of the capillaries of the medulla oblongata in cases of epilepsy.

The most interesting and practical chapters in the volume are the following: "On the Methods of Investigation pursued in regard to the Spinal Cord;" "The Physiological results of such investigations;" "The Pathological Investigation of the Medulla Oblongata in general, and especially in relation to the Pathology of Epilepsy;" "On the Medical Treatment of Epilepsy;" "On the Means of combating the Remote Causes of Epilepsy;" and lastly, "The Conclusions to be derived from a Study of the Pathological Part of the Work before us." It was our intention to have given some extracts from the work; but we are at a loss what to select; the whole is of so much interest, alike to the practical and busy Physician, as it is to those engaged in purely scientific investigations. We heartily recommend the book to our fellow-workers, as abounding in practical usefulness, and at the same time as highly suggestive. The translation by Dr. Moore, of Dublin, has been executed with an amount of taste and skill very rare in these days. It would be unfair to the Council of the New Sydenham Society to close this brief notice of a most valuable book without adding that it is only one of five supplied to the subscribers of one guinea for the year 1859. The works previously issued—Diday on Infantile Syphilis, Memoirs on Diphtheria, Gooch's Works, with Dr. Fergusson's introduction, and a volume of Selected Essays to follow—make a very large return for a small investment, and will, we trust, lead to a great increase in the number of members of the Society.

A Manual of Operative Surgery on the Dead Body. By THOMAS SMITH, F.R.C.S., Demonstrator of Anatomy and Operative Surgery at St. Bartholomew's Hospital. With Illustrations. London: 1859. 8vo. pp. 139.

THE want of a concise illustrated book on the practice of Surgical operations on the dead body has long been felt in this country. The Student or Practitioner, anxious to avail himself of any opportunity which may present itself, has to search in ordinary works among a number of directions applicable only to the living, for that which he requires at a *post-mortem*, or in the dead-house or dissecting-room; or after performing one operation he finds he has mutilated a part of the body on which he might have practised other operations previously.

Two or three years ago Mr. Churchill announced a work of this kind, entitled, "The Practice of Surgical Operations on the Dead Body." It was to be founded upon Mr. Spencer Wells's courses of Demonstrations at the Grosvenor-place School, and arrangements were made for illustrating most copiously the details of every operation. But in consequence of the scarcity in the supply of subjects which is fast ruining the London School of Anatomy and Surgery, it was found impossible to produce such a work in a satisfactory

manner without considerable delay. Still the necessity for such a book has become more and more pressing, as the Army and East India Boards, and several of the Examining Bodies, require from students proof of practical operative dexterity on the dead body. Mr. Smith accordingly comes forward with the laudable intention of supplying an acknowledged want, and has produced the work before us.

It is an ungrateful task to criticise severely the first book of a man of evident ability; but in the present instance we are compelled to state that Mr. Smith's book is a very poor one. In some respects it is quite a curiosity, even in these days of hasty book manufacture. It is an "illustrated" work on Operative Surgery in which the only illustration of any of the excisions of the joints is the figure of a director; in which the only illustration of the ligature of arteries is one showing the course of the lingual—an artery scarcely ever tied except as a dissecting-room feat; in which the only illustrations of lithotomy consist of figures of two instruments used in Mr. Lloyd's operation; in which the only illustrations of operations on the eye represent probing of the nasal duct; in which (not to continue a long list of similar omissions) thirty-two illustrations are given to a book which would hardly be complete with less than three hundred. Some of the illustrations—those which are copied from Mr. Teale, for instance—are very good. Others—Figs. 18, 19, 20, 21, for example—are as calculated to lead the student into the most awkward possible use of his hands as anything we can conceive.

But it is not only with regard to the illustrations that the work is defective. In describing the various sutures used, the use of metallic sutures is passed over in four lines; and not a word is said of the sutures of Sims, Bozeman, and Simpson, which have attracted so much attention lately. Nor is anything said of the surgical knots used for tying nævi and a variety of other purposes. Operations on the eye are described without a word about extraction of the lens, artificial pupil, or iridectomy. There is not a syllable about any of those plastic operations on the eyelids, nose, or lips, which the student can practise most usefully on the dead body. No operation either on tongue, tonsils, or palate is once alluded to. No allusion is made to venesection or arteriotomy. The division of nerves is passed over in silence. The use of the trocar in the chest and abdomen is equally untaught. Nor is there a word said as to the use of sound or catheter, either in the male or female urethra, or the uterus. Lithotrixy, the various modes of puncturing the bladder, the perineal section and other modes of dividing strictures, circumcision, and the plastic operations on the male and female genito-urinary organs are also passed over as if they were utterly unknown and unnecessary operations. Nor is a word said as to the equally important operations of herniotomy, and those for the radical cure of reducible hernia.

So much for that which is left undone. That which is done is done so ill that it had better have been left undone. We make no accusation of positive blunders; but there is a total want of that precision and care in detailing the various steps of each operation which can alone render such a book useful to the student or creditable to the author. We believe the kindest advice we could give would be, that the first edition of this book should be immediately cancelled, that the author should spend a year with a good artist in the dead-house, that he should attend courses of the best Demonstrations of Operative Surgery in France and Germany; and then, with care and patience, he might produce a new work, and avoid the uncomfortable reputation which every young man who publishes a poor book is certain to acquire, and which it may take years of earnest work to efface.

The British and Foreign Medico-Chirurgical Review, or Quarterly Journal of Practical Medicine and Surgery. No. XLVIII. October: 1859.

THE first review in the present number of the *Quarterly* is devoted to an acute analysis of Professor Virchow's work on Cellular Pathology. While due credit is given to the ability and research evinced in this and all the other labours of the Berlin Professor, yet the weak parts of his cellular theory are temperately and ingeniously discussed. In an article on the "Modern Doctrines of Syphilogeny," the "Lettsomian Lectures," of M. De Meric; the "Lectures on Chancre," delivered by Ricord, and translated by Mr.

Maunder; and the "Treatise on Syphilis in New-born Children," by Diday, translated for the New Sydenham Society by Dr. Whitley, are brought under notice; but the Reviewer controverts several of the doctrines advanced by Ricord, especially those relating to the question of inoculation, and to the distinction between infecting and non-infecting chancres. In another article, entitled "Medicine, Religion, and Philosophy," the writer discusses a question not often broached in a Medical periodical, namely, the connexion between the theory and practice of Medicine and the extension of religious knowledge throughout the world; and an acquaintance with Medicine and general science is recommended as a valuable auxiliary to missionary enterprises. The subject of Physiology is fully considered in the present number of the *Review*, for one article is devoted to the "Treatise on Human Physiology," by Dr. J. C. Dalton, of Philadelphia; and the "Outlines of Physiology," by Dr. J. H. Bennett, of Edinburgh; while another article, and a very long one, is founded upon Dr. Todd's "Cyclopædia of Anatomy and Physiology." Dr. Dalton's Treatise is spoken of with commendation, as containing (what is unusual in American Medical literature) several original investigations; but Dr. J. H. Bennett's "Outlines" are censured as being unworthy of his reputation. The "Cyclopædia" of Dr. Todd affords occasion for a very able retrospect of the progress of Physiology during the last five-and-twenty years. An article on "The Treatment of Delirium Tremens" advocates an entirely opposite treatment to that at present adopted for that disease; and although, perhaps, the writer will meet with much opposition to his views, it must be admitted that they are advanced with considerable force. The original communications consist of four articles: one on "The Outbreak of Yellow Fever among the Troops at Newcastle, Jamaica, in 1856," by Mr. Lawson; a short, but interesting paper on "Anæsthesia," by Dr. Hayward, who relates the history of the first introduction of anæsthetics into America, and gives his preference to ether; an able description, illustrated by engravings, of the "Nutrition, Inflammation, and Ulceration of Articular Cartilage," by Mr. Barwell; and a "Series of Clinical Cases, with Observations," also illustrated by engravings, brought together in corroboration of the views recently advanced by Dr. Brown-Séquard on certain points connected with the Nervous System. From the above glance at some of the subjects contained in the *Review* it will be perceived that the present number is full of interest to the Profession.

The Surgeon's Vade-Mecum: a Manual of Modern Surgery. By ROBERT DRUITT, M.D., F.R.C.S. Eighth Edition. London, 1859.

THE circumstance that seven editions of the well-known work before us have been exhausted, proves how well the labours of Dr. Drutt have been appreciated by his Medical brethren and by Medical students, and makes it quite unnecessary to discuss its merits now. We shall, accordingly, confine ourselves to a notice of those points which are new, or more elaborated than in the previous editions.

The chapter on Inflammation is entirely new. Its pathology, the theories regarding it, and its various phases, are considered concisely, but clearly and fully. That important affection, Pyæmia, is very properly treated of in connexion with the subject of erysipelatous inflammation, to which it is very closely allied.

The chapter on Cancer and its treatment will be read with interest, as the merits of the boasted caustic plan of treatment are discussed at some length. Dr. Drutt evidently has no leaning towards this mode of extirpation, nor, indeed, we may say, towards the use of the knife; but, when any operation is necessary, to use his own words, "The knife is undoubtedly to be preferred in all cases as the more merciful." (P. 117.)

The chapter on Gun-shot Wounds is new; and the author is indebted for the material contained therein to Mr. Lawson, who saw much active practice in the Crimea, and who has already published some excellent observations on the same subject. Many interesting cases, illustrative of particular points of practice, are detailed in the form of notes.

To the chapter on the Diseases of the Eye, much has been added; and the value of the ophthalmoscope as a means of

detecting incipient and hidden disease of the deeper structures is demonstrated. The mode of employing the instrument, the appearance of the parts seen by it in their healthy state, and the various morbid conditions which may be observed by one skilled in its use, are entered into with considerable minuteness and clearness. To Mr. Walton the author expresses himself as much indebted for assistance here.

The Radical Cure of Reducible Hernia is discussed in connexion with the modifications of the method of Wutzer, practised here of late years by Mr. Spencer Wells, Mr. Redfern Davies, Mr. Wood, and others. Dr. Druitt thinks highly of Mr. Wood's operation. It is rather early as yet to form any judgment as to what its ultimate success may be; but our own conviction is, that in cases of direct inguinal hernia, and in cases of oblique inguinal hernia with short canal, it will prove (with such modifications as experience may teach) the general operation; while in cases of oblique inguinal hernia, with a canal of at least an inch in length, the simpler and safer method of Wutzer will be adopted. Cases treated in this manner have stood the test of years, which of course cannot be said of the operation more recently introduced.

The various important questions connected with the diseases of the urinary passages and the bladder, and the merits of the many plans of treatment suggested for these diseases, are considered fully and impartially. With regard to the seat of stricture, which question has been recently a subject of discussion, the author agrees with Mr. Henry Smith, and quotes the opinion of that writer delivered in 1849, that permanent stricture is most frequently situated "in the substance of the bulbous portion of the canal, or a little anterior to it."—P. 560.

When describing the perineal section, Dr. Druitt very cautiously advances no opinion one way or the other; but after having detailed the mode of operating recommended by Mr. Syme, he says, truly enough, "The amount of fatality attending it must be difficult to be estimated properly."

The question of Ovariectomy is discussed at considerable length; and although Dr. Druitt has by no means hidden from view the dark side of the picture, it is evident that he views the operation as a legitimate and merciful one, if it be undertaken in properly-selected cases. If the modern appliances of Surgery are used as they should be in connexion with the performance of ovariectomy, and if those directions which regard the after treatment of the patients which have been laid down by the most experienced operators are attended to, there is a probability that this proceeding will be followed by results equal to those of the other capital operations—such as lithotomy and the larger amputations.

Another proceeding which has also been much discussed since the last edition of this work appeared—Excision of the Knee-joint—has received careful notice at the hands of Dr. Druitt. We cannot do better than quote his words from the Preface to his work on this matter:—"It will indeed be a reproach to Surgeons if this humane and rational operation shall be discontinued on the plea of want of success or large mortality resulting." Dr. Druitt very properly refers in high terms of commendation to those gentlemen whose names are intimately connected with "a revival which is one of the greatest triumphs of modern Surgery" (p. 744)—Mr. Ferguson, Mr. Jones, and Mr. Price.

In closing this brief notice, we recommend as cordially as ever this most useful and comprehensive handbook. It must prove a vast assistance, not only to the Student of Surgery, but also to the busy Practitioner who may not have the leisure to devote himself to the study of more lengthy volumes.

TESTIMONIAL TO A MEDICAL OFFICER.—In consideration of the gratuitous services and unvarying kindness displayed during the last six years by Mr. J. B. Lean, resident medical officer of the Brixton, Streatham, and Herne-hill Dispensary, a meeting of the poor who have benefited by his valuable services was lately held to evince respect for the gentleman referred to by the presentation of a gold watch and chain, bearing the following inscription: "Presented by the poor to Mr. H. B. Lean, of the Brixton Dispensary, as a token of esteem and gratitude—October 4, 1859." Such a testimonial, proceeding from the humble class of individuals for whose welfare he has laboured, cannot fail to be most gratifying, and as an example of honourable feeling is well worthy of record.

PROGRESS OF MEDICAL SCIENCE.

Selections from Foreign Journals.

ON THE CAUSES OF THE INDEPENDENCE OF BRONCHITIS IN RELATION TO PNEUMONIA.

By M. ROBIN.

THESE M. Robin has never found stated by any author, and that arises, he believes, from the faulty notions which prevail as to the elementary structure of the organ of respiration. It is customary to represent the tissue of the lungs as a mere continuation or expansion of the bronchi, which is as incorrect as it would be to represent the uriniferous tubes of the kidney as a continuation of the urethra, bladder, and ureter. As long as he believed in this doctrine, M. Robin never could comprehend why bronchitis should not constantly be passing into pneumonia. Nothing, however, can be more distinct than the pathological anatomy and symptoms of the two affections, which may be sometimes observed co-existing, but never passing from the one into the other.

The differences between the two diseases, marked as they are, must remain incomprehensible to those who consider the entire tube as lined with an uninterrupted mucous membrane from the larynx to the extreme subdivisions into *cul-de-sacs*. The real state of things is, however, as follows:—Having passed through a certain number of subdivisions, the bronchi, now no more than one or two millimetres in diameter, lose their portions of the cartilaginous rings, and have no longer transverse muscular fibres, elastic longitudinal fibres, or a mucous membrane separable from the bronchial wall properly so called. They no longer possess a prismatic epithelium with vibratile cilia—losing, in fact, all the characters of bronchi. The pulmonary or respiratory canalicules, erroneously termed ultimate bronchial ramifications, continue to subdivide and terminate in rounded or ovoid *cul-de-sacs* (improperly called bronchial or pulmonary cells), which at the period of birth are from five to eight hundredths of a millimetre large, and in the adult attain the size of one or two tenths. These canals have not the structure of the bronchi, but are characteristic of the pulmonary parenchyma. They are surrounded by intimately interlaced bundles of elastic fibres, mingled with fibres of the laminated tissue, formed of fibro-plastic elements, and of vessels. These vessels form on the interior of the canalicules (which presents slightly projecting folds), a network differing from that of the bronchi. This network consists of large capillaries, which nearly touch each other, so as to leave intervals smaller than the capillaries themselves. It is distributed on the very tissue of the walls of the pulmonary canalicules (there being no mucous membrane separable from the elastic parenchyma), and is only separated from the cavity of these conduits by a layer of pavement epithelium with large nuclei, which commences where the cylindrical epithelium of the bronchi ceases. Thus the pulmonary canals, in which hæmaturia is accomplished, have a different structure to that of the bronchi which convey the air necessary for respiration. It is not possible to detach a mucous membrane distinct from the pulmonary parenchyma and the laminated tissue, in which, or on the surface of which, the capillary network is distributed, as is the case in the bronchi still provided with cartilages. In this way we may explain the rapid absorption which takes place in the lung, as compared with the slower absorbing power of the organs provided with mucous membranes—as also the easier rupture of these capillaries, with discharge of blood, or of substances injected by the air-passages. There is, in fact, as great a difference in texture between the bronchi and the pulmonary parenchyma, as between that of the excretory duct of a gland, and of the gland itself.

It will therefore be seen that affections seated in two portions of the apparatus so different, may well present great distinctions in their course, etc. But a still more important cause also explains the rarity of the extension of inflammation from the bronchi to the pulmonary tissue. Thus, in the case of bronchitis, the portion of the capillary system which is the seat of inflammation belongs to the general capillary system, properly so called, and receives its blood from the aortic or red-blood system; but in the case of pneumonia, the capil-

larities of the lesser circulation, deriving their supply from the black blood of the pulmonary artery, are in question. It is at the expense of this black blood that the morbid products of pneumonia are formed, as in hepatitis it is at the expense of the black blood of the vena porta that abscess of the liver is produced. We know, in fact, that although the pulmonary artery accompanies the bronchi throughout their entire extent, it gives no branch to them, nor to the interlobular partitions, and that it does not anastomose with the bronchial arteries. The latter entirely cease at the points where, or at a little beyond where, the small cartilaginous nuclei disappear from the bronchi, *i.e.* where the bronchial canalicules are only one millimetre, or a little more in diameter. This is the exact spot where the capillary distribution of the venous artery begins to take place between the contiguous walls of the pulmonary canalicules, forming on their sub-epithelial surface a network of quite a special type of mesh-work, which is also found in the lesser circulation of all classes of vertebrate animals, even to the branchial plates of fishes. Beyond the bronchi, the bronchial arteries only furnish *vasa vasorum*, and branches to the interlobular laminated tissue, which extend as far as the pleura.

These circumstances supply not only an answer to the question proposed in this article; but also explain some of the differences which distinguish the nature and progress of inflammation of the lungs from that of other parenchymatous organs. It explains also the differences of pneumonia, according to age, differences not exhibited so decidedly in the inflammations of any other organ, and which arise, not only because the parenchyma and the respiratory canalicules undergo notable modifications, but also because modifications in its nature and course are produced upon the inflammation by the nature of the circulation. These are no where so decided as in the lesser circulation, which unites anatomically and physiologically the two sides of the heart, although its disturbances are often only caused indirectly, in consequence of lesions of the left side of the heart, instead of directly by changes on the right side.

Independently of the special type of distribution presented by the pulmonary capillaries, differing from that of the bronchial, their structure also differs in some points from that of the general capillaries. They are, in fact, amongst the largest of the body, and their parietes present smaller, more numerous, and more approximated nuclei than those of the other capillaries. It is, however, to be observed that the capillaries of the portal system in the liver present the same peculiarities of structure. These facts are not without their value, when we call to mind that inflammation is a disturbance of the capillary circulation.—*Gazette Médicale*, 1859. No. 2.

THE PRINCE OF WALES has been entered a Member of Oxford University. He was received on the occasion at the Railway-station by Dr. Acland and others.

SEAMEN'S HOSPITAL (DREADNOUGHT).—The quarterly court of the governors of this institution was held yesterday, at the office of the Hospital in King William-street, under the presidency of Mr. T. H. Brooking. It was stated that the number of patients admitted from the 30th June to the 30th September was 9 from Her Majesty's ships and 471 from British and foreign merchant vessels, which, with those remaining in the Hospital after the 30th of June, made a total of 608 British and foreign seamen who had received Medical assistance on board the *Dreadnought* during the last three months. The number of out-patients who had received aid from the Hospital during the quarter was 386. There were on board at present 135 sick, and 6 convalescent. The number discharged since 30th June was 476. The accounts showed an excess of expenditure over income of 466*l.*

ASYLUM FOR IDIOTS.—We beg to call the attention of our readers to the case of Charles Edward Silk, whose friends will make their last application for his admission into the Asylum for Idiots, at the election which takes place on the 27th instant. His father is one of the relatives of the founder of Guy's Hospital. He held the situation of Museum-keeper in that institution for twenty-eight years. His case is recommended by the following gentlemen connected with the Medical Profession,—Drs. Gull, Sibson, Pavy, and Mr. Lund.

FOREIGN CORRESPONDENCE.

FRANCE.

PARIS, OCTOBER 10, 1859.

At a time like the present, when the country is threatened with another epidemic of cholera, it is a source of satisfaction to know that efforts are still being made to discover an efficacious remedy for that disease. Of late years a thousand and one specifics have been proposed, but, unfortunately, on being put to the test, they have all more or less been found wanting, and we are perhaps at this moment no farther advanced in regard to its treatment than we were when it first invaded our shores. A sum of money amounting to £4000 was, some years ago, left by a Frenchman of the name of Bréant, to be awarded to him who should produce an infallible remedy against this fatal malady; but, up to the present time, the Académie des Sciences, in whose hand the legacy was left in trust, have not found in the numerous specifics submitted to them, any one *sufficiently infallible* to entitle it to the proffered reward. A new candidate has recently appeared in the field in the person of one of our countrymen, Dr. Pickering, of York, and from the high ground he has taken, it is evident that he himself, at least, has full faith in his new remedy; but, owing to the very peculiar and somewhat irregular manner in which he presented it to the Academy, that learned body did not give it that amount of consideration which its discoverer believed it merited. Dr. Pickering, thinking himself slighted by the Academy, addressed himself directly to the Emperor, and succeeded in enlisting the sympathies of that august personage in his behalf. The consequence was, that at the last meeting of the Academy a communication was received from the Minister of Public Instruction (together with Dr. Pickering's letter to the Chief of the State), requesting that he might be informed as to what steps the Academy intended to take in reference to the Doctor's discovery. Hereupon, it was stated that the facts alleged in Dr. Pickering's letter to His Majesty were fundamentally correct. He had certainly announced to the Academy that he had discovered an efficacious remedy against cholera, and he had been duly requested to make it known to them. Instead, however, of sending an account of the composition of the remedy, and of the manner in which it should be employed, he contented himself with forwarding a quantity of the medicine *ready made up*, together with some directions as to the doses.

It had previously been intimated to Dr. Pickering that the Academy could pay no attention to communications relating to remedies, the formulae for the preparation of which did not precede or accompany them. The Doctor having in the face of this intimated his intention of not divulging his secret without a pecuniary compensation, the Academy had no alternative left but to reject his application and exclude him from the "Concours" for the Bréant prize. In conclusion, Dr. Pickering's letter was handed over to the section of Medicine and Surgery charged with the awarding of the legacy, and they were requested to prepare without delay a reply to the Minister of Public Instruction stating these facts, and the resolution the Academy had come to on the subject.

At the Hôpital la Charité, M. Briquet, one of the Physicians of that Institution, has been experimenting to some extent with the sulphate of atropine in the treatment of deep-seated neuralgic affections. These experiments I have followed with much interest and attention, but I regret to state that the result has not been very satisfactory. He employs the atropine in the form of a weak solution, the proportion being 60 centigrammes of the sulphate to 30 grammes of water. The following is his mode of procedure:—A very fine trocar armed with a canula is plunged into the tissues in the direction of the affected nerve, and as near the supposed seat of the diseased portion of it as possible; the trocar is then withdrawn, and a small syringe previously charged with the atropine solution is then fitted on to the canula—a small screw attached to this syringe so acts on the piston that at each turn of the former one drop passes into the tissues. In fact, the entire apparatus is very similar to, and perhaps identical with, that invented by M. Pravaz, for the injection into varicose veins of the perchloride of iron, with a view to

their obliteration; and seems exceedingly well adapted to the purpose. Eight drops of the solution are generally injected by M. Briquet as the minimum, but the number of drops is increased to fourteen or fifteen in the course of a given time. Should no decided impression be made on the neuralgic pains, in those cases where he employs it, after seven or eight applications he abandons this agent for some other plan of treatment. I have generally observed that the opposition shown by the patients to its use is very considerable, in consequence of the disagreeable, and somewhat painful feelings, caused by the atropine, and a good deal of coaxing on the part of the Physician is required to induce them to submit to it. I do not allude to the local effects of the atropine, for these are but trifling, consisting simply of a sensation of heat and smarting; but to those effects produced on the system generally,—most commonly in the course of half-an-hour after each injection, the patient complains of soreness and dryness of the throat, rendering deglutition difficult; the breathing is more or less affected, there is pain and difficulty in urinating, headache, and double vision, with confusion of ideas; in fact, all the constitutional symptoms which are observed to follow on a very large dose of belladonna. These peculiar effects last for one or two hours, and are succeeded by a feeling of general *malaise*, accompanied with loss of appetite, which continues even during the following day. From one to two days are generally allowed to intervene between the applications. I have seen this system of treatment employed in some ten or twelve cases of sciatica, but with the exception of a *partial* remission of the neuralgic pains in some three or four of them, no amelioration was observed to follow it. I have been informed, that at La Pitié, M. Becquerel has been more fortunate than his *confrère* M. Briquet has been at La Charité, in his experiments with this remedy; but not having been an eye-witness of those conducted by the former, I cannot speak positively on the point. In some future communication I may take an opportunity of reverting to the subject. I have also recently seen the same agent employed according to this hypodermic method, in a case of obstinate and prolonged contraction of the muscles of the leg and foot, following on an attack of hysteria. As the history of the case is full of interest, I shall give it in a few words. The patient, a girl, twenty years of age, of *nervo-sanguine* temperament, has been subject to fits of hysteria since the age of fifteen. Her mother, who died when the patient was young, is represented as having been quick-tempered, and very irascible; and the father is at this moment in a mad-house, where he has been an inmate for some years. She has consequently inherited a tendency to nervous disorders from both parents. Within the last year the fits have become, not only more frequent, but also more severe; and they now assume the epileptic form. Six months ago, after a paroxysm of unusual severity, she became quite blind, and during nine weeks could hardly distinguish night from day; her sight, however, gradually returned, and is now as perfect as ever. On another occasion, after a second severe paroxysm, she completely lost the power of speech, but her voice was soon restored under the influence of Faradisation. Two months ago, the time at which she was received into the ward of M. Briquet, she had a third severe attack, followed, not as during the previous ones, by loss of sight or voice, but by complete *anæsthesia*, or loss of sensibility, of one entire side of the body, and by violent and continued contraction of the flexor muscles of the right foot, giving it the form of the *varus club-foot*. The *anæsthesia* was cured by Faradisation; but all efforts made to restore the foot to its normal position were unavailing. The injection of the sulphate of atropine was tried for about a fortnight on every alternate day, and carried to the extent of fifteen drops at a time, with a view to paralyse the contracted muscles, but not the slightest benefit resulted. Faradisation was then vigorously employed almost daily for a week or ten days, and was in the end so far successful in relaxing the contracted muscles as to permit of the foot being placed almost in its natural position, in which it was retained by means of a mechanical apparatus. I may mention, however, that as soon as the apparatus was removed there was still a tendency to the recurrence of the muscular contraction, although not to the same extent as before the Faradisation was employed. It is more than probable, that had the patient remained under treatment some time longer, a permanent cure might have been the result; but, tired of the *régime* of the Hospital, she urgently requested her discharge, which was accorded her.

The last meeting of the Académie de Chirurgie was one of unusual interest, the sitting having been solely occupied with the discussion of a case of *spina bifida*, and a case of traumatic tetanus which was said to have been successfully treated with *woorara*. A child, six weeks old, affected with *spina bifida*, was, at the instance of M. Huguier, presented to the meeting, in order that he might have the benefit of the opinion of his colleagues as to the course of treatment he ought to pursue. The tumour was situated at the upper part of the sacrum, and its walls, which were firm and solid, exhibited no traces of inflammation; it was compressible, and part of the fluid contained in it disappeared on pressure, and its expansion and contraction were synchronous with the acts of inspiration and expiration. The health of the infant was good, and there was no paralysis of the bladder, rectum, or lower extremities. Without a single exception, all the members of the Society were opposed to an operation, and those who had the largest amount of experience in similar cases, were the most energetic in protesting against such a measure. M. Guersant, of the Hôpital des Enfants Malades, stated, in the course of his remarks, that he had punctured fifteen or eighteen cases of *spina bifida*, and in each case he had had reason to regret having done so. M. Velpeau, who had operated by puncture in four cases, had been successful in only one, and that after four successive operations followed by an equal number of iodine injections; in the case before the meeting, he advised M. Huguier not to have recourse to any surgical operation, but to treat the tumour by compression and the use of astringent lotions, which he believed would in the end prove successful. The case of traumatic tetanus was reported by M. Chassaignac as having occurred in his private practice. Three circumstances invested it with a more than common interest; first, its having had a favourable termination; secondly, its having been treated entirely by means of *woorara*; and, thirdly, the somewhat unusual, and, if we are to credit the experiments of physiologists, the unscientific manner in which this powerful agent was employed. After the case had been related to the Society, M. Chassaignac was subjected to a regular battery of questions, the answers to which materially tend to shake the confidence of the members as to the genuine character of the tetanus; and it was also a question with them whether the *woorara* had anything to do with the cure. It was the opinion of M. Larrey, and some others, that, although presenting certain of the characteristics of tetanus, such as trismus and *emprostotonos*, it was, properly speaking, one of a *local* rather than of a general kind, and consequently a form in which a spontaneous cure is often observed to take place. Such, it has been ascertained, was also the opinion of one of the Surgeons who had seen the case with M. Chassaignac, and who had been heard to style it "*Tétanos chronique avec intermittences*." Touching the manner in which the *woorara* had been employed, M. Chassaignac was rather roughly handled, and was taxed either with ignorance, or want of memory as to the inert character of *woorara* when administered by the mouth. That he believed in its influence on the system when exhibited internally is evident from the fact that he prescribed a potion composed of ten centigrammes of the drug dissolved in 120 grammes of fluid a teaspoonful of which he administered every two hours, and which, towards the termination of the treatment, had been increased to double its original strength. But if he displayed a want of knowledge of its effects when administered internally, he also displayed great clumsiness in his manner of applying it locally, which was as follows:—Twenty centigrammes of the *woorara*, dissolved in 120 grammes of some liquid, were used as a lotion, and applied to the wound by means of pledgets of lint, which were renewed every two hours. Now, employed in such an irregular manner, it is impossible, as M. Legouest very justly remarked, to know what quantity of the *woorara* had been absorbed by the system, the lint having in all probability taken up as much, if not more, than the wound itself had done; and thus we are left in doubt whether the *woorara* had anything to do with the cure at all. Besides, the *woorara* employed had not been tested on animals, either before or after its use in this case, and thus there was no proof of its having been pure. Altogether the discussion on this case did not redound much to the credit or praise of its reporter, and the Profession is no wiser as to the influence of *woorara* in this formidable malady than it was before the case was reported.

PROVINCIAL CORRESPONDENCE.

IRELAND.

DUBLIN, OCTOBER 17, 1859.

A meeting of the Queen's University in Ireland, for the purpose of conferring degrees and for the distribution of prizes, took place on Friday, October 14, in St. Patrick's Hall, Dublin Castle. The degrees were conferred by the Lord Chancellor of Ireland, Vice-Chancellor of the University; the prizes were presented to the successful candidates by his Excellency the Lord-Lieutenant. A very large assemblage was present on the occasion, among whom were the Marquis and Marchioness of Kildare, the Countesses of Charlemont and Shannon, Lady Caroline and the Misses Lascelles, the Lord Bishop of Derry, the Lord Chief-Justice of the Common Pleas, the Attorney-General, Judge Berwick, the President of the College of Surgeons, the Presidents of the Queen's Colleges, Sir Richard Griffith, Bart., Sir W. R. Hamilton, Drs. Corrigan, Power, Geoghegan, G. H. Porter, W. Colles, Gordon, Churchill, Harvey, etc. etc.

The VICE-CHANCELLOR addressed the meeting at considerable length. In the course of his observations he said,—“For our most important degree, that of Medicine, thirteen candidates have passed the examinations of this year, out of sixteen who presented themselves. Our first Medical Examinations have been successfully passed by twelve students.” The gentlemen on whom the degree of M.D. was conferred, were Thomas A. O'Flaherty, who obtained the first honour for proficiency in the course, William H. Bourne, M. J. Burke, Edward Dann, M. E. Fagan, Thomas J. Gelston, James P. Golding, Robert E. Heath, A. P. Holmes, Pierce Mansfield, Michael J. Rahilly, George Sigerson, and Henry Whitaker. One gentleman received the degree of LL.D.; the degree of M.A. was conferred upon seven candidates, including one *ad eundem* from the University of Dublin; two received the degree of LL.B., and sixteen that of B.A. Seven diplomas in Engineering, and one in Agriculture, were also conferred. The foregoing, with the twelve gentlemen who passed the “Previous Medical Examination,” made a total of fifty-nine successful candidates, of whom twenty-one received prizes. Only one honour was given among the candidates for the degree of M.D., and one among those who passed the Previous Medical Examination. The Vice-Chancellor stated that the number of candidates who presented themselves for degrees from the Belfast College, had been seriously diminished by the religious excitement in the North of Ireland, which appeared “to have had an unexpected influence in withdrawing some of the students either altogether from their ordinary studies, or for a time, at least, from that degree of attention to them, which was requisite in order to their being qualified as candidates on the present occasion. Whatever may be the future course of this movement, he added, or its results—about which it is not within my province to pronounce an opinion from this place,—whether it is to pass away as a transitory burst of passionate feeling, or to subside into the sober earnestness of sincere belief and awakened conscience, I must only here express the hope that it will not in any more serious degree disturb the progress of general and useful education.” The Vice-Chancellor proceeded, in the course of his remarks, to state that 139 new students were matriculated in the three Colleges in the session commencing in the winter of 1858, while 57 non-matriculated students then first joined their appropriate classes, making a total addition of 196. Of these, 71 were members of the Established Church, 53 were of the Roman Catholic faith, 53 belonged to the General Assembly of Presbyterians, the remaining 19 being classed under various denominations of Dissenters, including the Society of Friends. In conclusion, the Vice-Chancellor spoke for some time on the subject of the insufficiency at present of the means of middle-class education in Ireland, the advancement of which to a proper standard, is so necessary for the full development of the working powers and capabilities of the Queen's Colleges.

The thanks of the Senate, Professors, etc. of the University having been returned to the Lord-Lieutenant for the honour conferred on them by his attendance on the present occasion,

as well as for the uniform interest manifested at all times by him in the progress and welfare of the University and the Queen's College, his Excellency, in reply, said:—

“Vice-Chancellor and Gentlemen,—I rise, with your permission, to return a few words of thanks for the honour you have so courteously awarded me. The Vice-Chancellor of the Queen's University, gentlemen, has laid before this assembly, with his usual clearness and precision, all that pertains to the present circumstances and actual condition of the institution in which he holds so eminent a post. Into that branch of statement, accordingly, I may congratulate both the meeting and myself that I am not required to follow him. In meeting once more on this well-remembered spot this annual congress of the Queen's Colleges in Ireland, after a very short break of continuity, during which all will gratefully acknowledge your academic institution reposed under no unfriendly auspices in this island, it is certainly very gratifying that I should learn from so authentic a source that nothing has occurred of a retrograde or unfavourable character, but that the intervening period has been marked by features of distinction and hopefulness. I infer, indeed, on this occasion, that there are two causes—one of a more local, and it may be transient, the other of a more general and inherent character—which may be considered to have operated against a fuller attendance of competitors for the prizes and honours which it has been my pleasing duty to award to the successful candidates. The general cause to which I refer has been fully pointed out by the Vice-Chancellor—the absence of a sufficient number of intermediate or middle-class schools, to act as feeders or tributaries to the respective Colleges. This want is both recognised and appreciated by the Government, and the subject is now engaging attention; it is not, however, without difficulties both intrinsic and imported. The more local, and as yet at least partial cause is one which I mention neither with a view on this occasion to the expression of praise or blame, of sympathy or misgiving, but as a matter of positive fact. I am credibly assured several young men, who would otherwise have been here from the College at Belfast as competitors for our honours and degrees, have been diverted from their purpose by the engrossing interest excited by what is generally termed the ‘Revival’ in the North of Ireland. This is an incident worthy of being considered with that cautious and reverent watchfulness which is eminently due to the whole subject. If, however, there should appear to be temporary deficiency in the number of candidates for degrees, I am happy to find that there has been an increase in the total number of students in actual attendance on their collegiate studies, amounting, I believe, at present to very few short of 500, and I apprehend that nothing can be more satisfactory than the quality of the instruction imparted—(applause)—the high and deserved eminence of the respective professors, the elevated standard of the examinations as conducted in this place, and the practical results exhibited at the competitive ordeals now established in the country for employment in the civil, and, more expressly, the Indian service—all these combine to place the Queen's University on the most unassailable foundation in these respects. (Loud and prolonged applause.) I have never closed the observations I have been called upon to make on these occasions without specially addressing a few short words to the young persons I see before me. You, my young friends, are the main actors and principal objects in the proceedings which now terminate here. As to all the elders here assembled—myself among the number—we must feel that the pursuits in which we are severally engaged, and the cares which occupy us, are mainly carried on in behalf of the generation which is to follow us. Your presence here witnesses that your careers hitherto have attained a certain amount of success; let your subsequent careers exhibit a diligent pursuit of excellence in your several spheres of action, an honest desire to apply your own faculties and opportunities to the benefit of your fellow-men, a pervading consecration of your lives to the God who gave them. We introduce you, as it were, this day into a splendid arena—the service of a great and noble country. May you all live to see it, may you contribute to make it yet greater, yet nobler, yet worthier than you found it.” (Applause.)

The proceedings then terminated.

At the annual meeting of the King and Queen's College of Physicians in Ireland held, according to charter, on St. Luke's day, October 18, the following officers were elected for

the current year:—President, Dr. Corrigan; Vice-President, Dr. Neligan; Censors, Drs. Neligan, Mayne, Hudson, and Sinclair; Treasurer, Dr. Dwyer; Registrar, Dr. Steele; Librarian, Dr. George A. Kennedy; Professor of Midwifery, Dr. Churchill; Professor of Medical Jurisprudence, Dr. Thomas Brady; Examiners for the Midwifery Diploma, Drs. Dwyer, W. O. B. Adams, and Ringland; Inspectors of Apothecaries' shops, Drs. Mayne, Hudson, Travers, and Ringland.

GENERAL CORRESPONDENCE.

THE "FELL" TREATMENT OF CANCER.

LETTER FROM MR. H. K. OWEN.

[To the Editor of the Medical Times and Gazette.]

SIR,—In answer to the inquiry of "F.R.C.S.," in the "Notes and Queries" of last Saturday's *Medical Times and Gazette*, respecting the subsequent state of any of the patients subjected to the "Fell" treatment of cancer, one of the cases reported having since fallen within my notice, probably the few hasty notes I am able to send, may not be altogether void of interest to some readers, and may add a little to elucidate the important question of the advantage of this treatment over that usually adopted.

The patient alluded to is Mrs. M., Case No. 2, reported at page 67 of "Dr. Fell's Treatise on Cancer;" and as many of your readers may not have the work itself to refer to, I briefly condense the report of the case, from the copy presented by the Doctor himself to my patient:—

The age of patient was 60. Three years previous to the first report (November 1, 1855), a small lump was noticed in the breast, and pronounced as cancerous; this increased to April, 1855, when it ulcerated, exuding a thin ichorous discharge. She applied to the Cancer Hospital, but without benefit, as it continued to increase. When seen by Dr. Fell on above date, the tumour was the size of a large goose-egg, with ulcerated surface of the size of a penny-piece, discharging a thin, bloody, very offensive matter; there was also slight enlargement of axillary glands. The first application was made the same day, and continued until December 12, when the tumour was destroyed.

"December 23.—The tumour came out to-day: it was six inches long, four and a-quarter broad, and three and a-half thick. The wound looked very healthy."

The subsequent reports denote a favourable progress, and the last report, on April 7, 1857, is as follows:—"Saw Mrs. M. to-day; breast quite well; she is in excellent spirits. She says she never felt better, and her friends say she looks ten years younger than she did."

The subsequent history of the case appears to be this:—About April, 1858, a small ulcerated opening began to appear in the line of the cicatrix, attended with much pain and unpleasant discharge. When shown soon after to Dr. Fell, he honestly at once stated his inability to be of further service as regards a cure, and throughout acted with much kindness. After this, to the date of my seeing the case, the disease continued to extend, attended with much pain and fetid discharge, and after a time, with considerable oedematous swelling of the corresponding forearm and hand. Various palliatives had been had recourse to, with increasing doses of laudanum as required.

The patient when seen by me still bore the appearance of having been a hale and hearty woman, and although much confined to bed, was cheerful, and, notwithstanding the pain she had gone through, pretty stout. Her pulse was only a little quicker than natural; her secretions healthy; but appetite, probably from anodynes and effluvia, deficient. The arm from elbow downwards was enormously distended and oedematous. On raising the breast, a fearful surface of ulceration appeared, separating the whole breast, except at its upper and inner part, from the pectoral muscle, the whole surface having a greyish colour, and discharging a copious, offensive, ichorous fluid. The ulceration had been extending the last few days towards the axilla, and also along the lower margin of the breast, which was obliged to be supported. There had not been any hæmorrhage from this extensive

surface. No enlargement of any other part of the body could be felt externally.

I need not take up further space with any detailed account of the progress, as the treatment could be only palliative. The surface of the sore, as far as could be reached, was kept cleanly and free from smell by warm ablutions and the use of a very weak chlorate of soda solution. The general strength was supported by various tonics, and opiates were taken as required—I think more freely than I knew of; and attempts were made, by position, various local applications, and finally by frequent acupuncture, to relieve the oedematous condition of the arm, this being more a source of pain and suffering to the patient than the original disease. None, however, of these measures were of much, if any, benefit.

In the beginning of June some amount of hæmorrhage took place, which was restrained by styptics. The powers, however, after this, more rapidly sank, and on June 19 a very copious loss took place from some vessel towards the axilla, which continued in spite of applications, and, after five or six hours, terminated in a fatal syncope.

I may add, that another female, who had been under Dr. Fell, was also under my care at the same time as the above; but as the treatment was not completed, owing to the advanced period of the disease, and its implication of the deeper tissues, it would be unfair to cite it in reference to the treatment now in question. In this case, the patient sank, worn out and blanched by repeated hæmorrhages.

I am, &c. HARVEY K. OWEN, F.R.C.S.

Clapham-road, October 15.

LETTER FROM DR. OGLE.

[To the Editor of the Medical Times and Gazette.]

SIR,—An inquiry into the results of treatment of cancer by caustic has elicited a lucid and most instructive letter from Dr. Druitt. Let us hope others will follow; but many cancer curers will still have it in their power to say "This is only the statement of our opponents."

The circumstances which gave rise to the inquiry and the unreported cases which, in spite of your praiseworthy endeavour, must be lost sight of, suggest the reflection, whether, as a Profession, we do all that is in our power to do to eradicate error. We may do much that is right, and as individuals we may seem to do our duty, when as members we utterly fail. It is in the nature of things, that unless Professional duty—that is, duty to the public—be continually borne in mind; unless individual acts are constantly tested by the standard of an enlightened public opinion, personal interests will inevitably weigh too much with us, and our duty to the public will be neglected.

In another place I have advocated, that, in our relation to the public, a primary regard should be had to the fact that our duties imply that we are, not servants, but friends to our patients. We may become public servants without loss of Professional status, but to individuals we must remember that none but a friend can do the duty that will devolve upon us.

Let this relation be distinctly recognised, and we shall find that we are in a better position to fulfil our public duties. Let a man ask himself, "How should I act were this my brother, my sister, my wife?" and the difficulties of the case are wonderfully simplified. If a relative is resolved at all hazards to try this or that, you do not say, "Well, if you do so, I will have nothing more to do with you;" but you still of necessity have an eye upon the case, and your act, if not your language, is—"Well, I warn you; but if you will go I must go with you." Thus far is individual duty; what remains? By association (the watchword of the present day) all such cases should be impartially recorded, and the results given periodically. This co-operation for a specific purpose—not for the suppression of quackery so much as for the publication of the truth—is the public duty that as members of one body we owe to the community.

The principles that I have endeavoured thus briefly to apply to this case, are the self-same that on a former occasion were brought to bear on the vexed question of gratuitous advice. That they are applicable to all cases, arises from the simple fact that *non sibi sed toti* is founded on eternal truth.

I am, &c.

London, October 19.

WILLIAM OGLE.

PUBLIC VACCINATION.

LETTER FROM MR. GRIFFIN.

[To the Editor of the Medical Times and Gazette.]

SIR,—In reply to Dr. Sullivan's letter, inserted in your Journal of the 15th inst., permit me to say I have now in the press an amended draft of a proposed Act of Parliament for the Medical Relief of the Poor, and Vaccination, which will in a short time be laid before the Poor-Law Medical officers, who are subscribers to the Association, for their opinion. With regard to the term, "touting for cases," I think the expression is not borne out by the proposed clause, a copy of which is annexed, wherein it will be seen that the private Practitioner is allowed twelve months to do his duty, failing which, he has no right to complain of the Public Vaccinator calling upon his patient. I regret to perceive that the worthy Doctor has not complied with the Act of Parliament, which requires that returns should be made to the Registrar; many others, I fear, have adopted a similar course, which has been the cause of the imperfect state of the register, and justifies me in proposing a clause that in future the Registrars shall pay the Public Vaccinators their fees, and thus ensure a return of all their cases. I have also introduced a clause by which all registered Medical men will receive one shilling for each certificate of successful vaccination they furnish to the Registrars.

The Registrar is also made the public prosecutor, but I rely for the successful working of the Act rather upon its rewards than its penalties; though the dread of the latter must not be entirely laid aside, especially with those who propagate the contagion of small-pox.

I am, &c.

RICHARD GRIFFIN.

12, Royal-terrace, Weymouth, Oct. 17, 1859.

"XXXII.—That a quarterly list of all persons born since August 1st, 185 , and then living, above the age of twelve months, and under that of sixteen years of age, not registered as successfully vaccinated, be made out by the Registrar and delivered to one of the Public Vaccinators of the District in which the child resides, whose duty it shall then be to call upon the parents or other persons having the custody of the said child, and offer to vaccinate it at the public expense, if it be in a fit state to be vaccinated, and does not appear insusceptible of vaccination in consequence of having been previously successfully vaccinated or having had the small-pox: it shall then be the duty of the public vaccinator to make his report accordingly to the Registrar, who shall enter the same in his book, and if the parents or other persons having the custody of the said child have refused to have it vaccinated, it being at the time in a fit state to be vaccinated, he shall immediately sue the father or mother, or other person having the care, nurture, or custody of the said child, for the sum of Ten Shillings, together with all expenses, or in default, be committed to the common gaol or house of correction for any term not exceeding one month, nor less than one week, which penalty shall be incurred annually until a certificate be furnished that the child has been vaccinated, or is insusceptible of vaccination, or is sixteen years of age."

A HAIR-PIN IN THE URETHRA.—M. Segalas placed before the eyes of the Academy of Medicine a hair-pin, "which he had taken from the urethra of a man without the aid of any instrument." The fact was M. Segalas made a surgical instrument of the pin itself, pushing one end of it through the gland, and then drawing it out gradually. No accident followed in this case, or in another in which M. Segalas had performed a similar manœuvre. This case reminds us of a much more simple method adopted by the late Mr. Avery for the extraction of a hair-pin from the urethra of a gentleman; and it is well worthy of being recorded for the benefit of M. Segalas and others. In this case the pin had been pushed about one and a-half inches down the urethra, the two points looking towards its orifice. Mr. Avery firmly grasping the pin, squeezed the two ends of it together, and then with the other hand introduced down a straight tube—a divided catheter—which passed over the ends of the hair-pin. The hair-pin was then withdrawn, the elasticity of it keeping it firmly enough fixed in the tube when the pressure applied to it through the urethra was taken off.

REPORTS OF SOCIETIES.

THE PATHOLOGICAL SOCIETY.

TUESDAY, OCTOBER 18TH, 1859.

MR. FERGUSSON, PRESIDENT, IN THE CHAIR.

MR. FERGUSSON on addressing the Society at their first meeting for the session, congratulated the members on its increasing prosperity and usefulness. He thought the Society was in its aim essentially practical, and that it must necessarily include men of practical minds among its members. He stated that he felt convinced that the transactions of the Society, as recorded in the volume for the past session, would be as acceptable as any of its former records. He appealed to the members of the Society not to intermit their endeavours to render the meetings as interesting as they had been in previous years.

Dr. OGLE then read the minutes of the last meeting.

The PRESIDENT exhibited

A MEDULLARY TUMOUR CONNECTED WITH THE FIBULA OF A MAN.

When first seen it was of the size of the fist, and was not thought to be malignant. It was repeatedly under observation, and removal was advised, but the patient refused. Eighteen months afterwards it had attained the size of a child's head, and had apparently involved all the neighbouring tissues. Amputation was performed. The diagnosis of the tumour before death was very doubtful from its hardness, the muscles and aponeuroses being so stretched over it that it gave a feeling of hardness like that of an osteo sarcomatous tumour. The inguinal glands were enlarged, but very slightly.

A paper, by Dr. PEACOCK, was read on

MALFORMATION OF THE HEART.—IRREGULAR COURSE OF THE AORTA AND UNUSUAL ORIGIN OF THE PRIMARY VESSELS.

The subject of this case was a boy, who was under the care of Dr. Brinton, at the Royal Free Hospital, and was sent by that gentleman to Dr. Peacock. He was born at the full period and of healthy parents, and his mother stated that at birth he was a healthy child. When three weeks old he was noticed by a Medical man to be unusually dark coloured, and from this time the lividity became more marked. At the age of seven or eight months he began to suffer from suffocative attacks ending in convulsions, and of these he sometimes had several in the day. He became remarkably cyanotic, vomited his food, and had constant diarrhoea; he was excessively restless and irritable, and became extremely emaciated and died exhausted when one year and ten and a-half months old. The heart was found to be much larger than usual in a child of that age. The right ventricle was very large, and its walls thick, and it constituted nearly the whole of the anterior position of the organ. The pulmonary artery was of very small size, and divided shortly after its origin into the usual branches. There was no ductus arteriosus. The aorta was from the right ventricle, but communicated with the left by an aperture in the septum. The right auricle was very large and the foramen ovale closed: the left auricle and ventricle were relatively small. The aorta followed an unusual course, passing over the right bronchus and thence to its ordinary situation on left side of the bodies of the vertebrae. The branches given off at the arch were irregular. Soon after the commencement of the vessel the two carotid arteries arose and passed up on the sides of the trachea. The right subclavian artery next passed from the vessel when it was making its first turn, and then the left subclavian rose from the aorta at the back of the trachea, and passed outwards, lying behind the left branches immediately at its commencement. Dr. Peacock considered the case as an especially interesting one—1st. From the intensity of the cyanosis, which exceeded what he had seen in any other case. 2nd. From the variable character of the physical signs. It had been observed by both Dr. Brinton and himself, that while the child was tolerably quiet, the

double cardiac sounds were distinct and natural; there was occasionally a loud systolic murmur audible over the whole front of the chest. 3rd. From the absence of the ductus arteriosus, the irregular course of the aorta, and the unusual distribution of the vessels at the arch. From these peculiarities Dr. Peacock inferred that the branchial arches which form the right aorta had been persistent, while those which are usually persistent, and form the left aorta, had become abortive. Tiedeman, Quain, and MacLise have figured similar irregular orifices of the puny vessels from Walthus and Bochmer; but it did not appear that in these instances the aorta had followed an irregular course, or that the conformation of the heart had been defective.

A second paper was read by Dr. PEACOCK on

OBSTRUCTIVE AND REGURGITANT DISEASE OF THE AORTIC VALVES, WITH REGURGITATION THROUGH THE LEFT AURICULO-VENTRICULAR APERTURE.

The subject of this case was a girl 15 years of age, who was an in-patient at the Victoria-park Hospital for Diseases of the Chest. She had had rheumatic fever six years before, and had suffered from symptoms of cardiac disease for four years. She was first admitted into the Hospital on the 11th of March, and was then suffering from dyspnoea, palpitation, and some cedema, especially of the lower extremities. The præcordial region was very greatly protruded, the cardiac dulness much increased in extent, and the pulsation widely diffused. The pulse was irregular, and a loud systolic murmur was audible over the whole præcordia, and most intensely below the left nipple. While in the Hospital she greatly improved, the cedema subsided, the pulse became regular, her breathing was less hurried, and she gained strength. At her own wish she was discharged on the 16th June, and at that time, in addition to the systolic murmur audible both at the apex and base, there was a slight systolic murmur which was heard at the base, and which followed a loud diastolic sound. She continued much the same after her discharge till about the 14th of September, when she was seized with sickness, vomiting, and diarrhoea. She was re-admitted into the Hospital on the 28th of September. She was then greatly exhausted, the dyspnoea was very urgent, and she was constantly in an almost syncopical state. The physical signs continued much the same as before. There was a systolic murmur heard most loudly at the apex, but a systolic murmur was also audible at the base, and was followed by a distinct diastolic murmur. She died, exhausted, on the 5th of October. On examination, the pericardium was found universally attached by old cellular adhesions. The heart was very greatly hypertrophied and dilated, and weighed, with the adherent pericardium, 25 ounces avoirdupois. The hypertrophy and dilatation, though involving both the right and left auricles and ventricles, was much the most marked at the left side. The aortic valves were thickened, and one of the segments fell below the proper level, so as to allow of free regurgitation from the aorta into the left ventricle. The left auriculo-ventricular aperture was much dilated, and the valves were incapable of closing the orifice. The left auricle was very large, its walls thick, and the lining membrane thickened and opaque.

Dr. WILKS exhibited a specimen of

TYPHOID DISEASE OF THE LARYNX.

He stated that it was the third case which had come under his notice, and referred to one reported in the *Medical Times and Gazette*, for October 8th, under the head of "Tracheotomy for Laryngeal Affections." Although it was rare, he believed it to be more usual than was supposed. It was mentioned by Dr. Huss as being common in the North of Europe. This specimen was taken from a man aged 23, a patient of Dr. Addison, in Guy's Hospital, who was suffering from all the ordinary symptoms of fever, rose rash, diarrhoea, pneumonia, etc., when death occurred rapidly from the sudden supervention of symptoms of laryngeal obstruction. A small slough was found at the back of the larynx, at the root of the arytenoid cartilages—being the usual weak point of the larynx.

In reply to Mr. Adams, Dr. WILKS stated that there was no history of prior syphilitic disease of the larynx.

Dr. WILKS also exhibited

AN ANEURISM OF THE SUPERIOR MESENTERIC ARTERY.

It was the second specimen of the kind ever exhibited before this Society, the former one being shown by Dr. Ogle. The patient was admitted into Guy's Hospital for subacute rheumatism and old disease of the aortic valves. He died suddenly. After death, plugs were found in the spleen and liver; and in the mesentery, under the peritoneum, a pint or two of blood, which was found to come from the aneurism in question. The aneurism was the size of an egg, and the rent in it about half-an-inch. Dr. Wilks considered that this case was again confirmatory of the opinion of Dr. Ogle, that the frequent connection between cardiac disease and aneurism was more than a coincidence.

He also exhibited a specimen of

SYPHILITIC DISEASE OF THE LIVER,

Taken from a patient aged 8 or 10. The patient was a miserable, puny, and cachectic child. Admitted for sequelæ of scarlet fever. The liver was found fissured all over the surface, and full of small fibroid nodules of a hard, leathery consistence, which by their contraction had caused this puckering of the tissue. There was no trace of tubercle in the body.

Mr. HOLMES exhibited, for Mr. Blagden,

A TUMOUR TAKEN FROM THE FACE.

The patient was a healthy, labouring man, and had had the disease fourteen years. Mr. Blagden removed it fourteen days ago. There was little hæmorrhage, and the wound healed by the first intention. It consisted of nothing but fibrous tissue and nuclei.

Mr. HOLMES also exhibited a specimen of

DETACHED CARTILAGE OF THE KNEE,

Taken from the limb of a man, an in-patient in St. George's Hospital, whose leg had been amputated for compound fracture into the joint. He had had previous disease of the joint. It illustrated the possibility of the occurrence of loose cartilage from accident.

Dr. GIBB brought forward a specimen of

CANCER OF THE LIVER AND LUNGS,

Taken from a woman whose cervix uteri had been excised for local cancer, and in whom the recurrent disease was again removed, both about three years ago, by Mr. Hutchinson. The vagina and uterus were much affected by the disease, which had also laid open the bladder. Nearly all the viscera were affected, and in the lungs there was a little tubercle. The glands by the side of the spine were also affected. Another peculiarity was the condition of the kidneys. The right weighed seven and three-quarter ounces, and contained in its pelvis saccharine urine, specific gravity 1026, and a small quantity of albumen; the left weighed only three ounces, and contained albuminous urine of neutral reaction, specific gravity, 1015.

In reply to Dr. Harley, Dr. GIBB stated that in the smaller kidney there was probably little healthy kidney tissue left, and he would thus account for the absence of sugar in it.

Dr. HARE stated that the smaller kidney was a well-marked instance of hydronephrosis, and that it would be unable to perform its functions.

Mr. BIRKETT exhibited a specimen and drawing of a

POLYPOID TUMOUR,

which grew from the middle line of the palate, a little above the uvula. The patient was a healthy dockyard labourer, and the tumour was observed accidentally. Mr. Birkett considered it to be analogous to a specimen of polypus of the bladder, which he had exhibited on a previous occasion, and believed it was not cancer. The man was now nearly recovered.

Mr. BIRKETT also exhibited a drawing of

MYELOID TUMOUR,

occurring on the forehead of a child. At an exploratory operation it was found to be circumscribed; but as it was fitted round with a ring of bone, it was thought advisable not to proceed further for fear of opening into the cranial cavity. Sloughing afterwards took place, followed by death, and none

of the tumour was therefore obtained for microscopical examination; but it was supposed to be myeloid. A small aperture was discovered in the bed of the tumour, through which the discharge had passed, leading to suppuration of the dura mater.

INTESTINAL CONCRETIONS.

Dr. HARLEY showed three specimens of intestinal concretions which he had analysed; two of them were from the human subject, and the other from the stomach of the horse. The latter, which was presented to University College Museum, by J. N. Blake, Esq., was an oval, slate-coloured, very dense and heavy stone, somewhat larger than a duck's egg. It consisted of lime and magnesia, combined with phosphoric, and a trace of sulphuric acids. It had for a nucleus a crooked, rusty, iron nail. The second specimen was a concretion of organic matter, measuring when fresh nine inches long, and six and a-half in circumference. It was passed after five weeks' suffering, by a gentleman, aged 56, a patient of Professor Quain's. On microscopical examination Dr. Harley found it to consist of striated muscular fibres, fibro-cellular tissue, short portions of blood-vessels, and a few hairs, the whole being bound together by a quantity of mucus and lymph. The third specimen was passed by a young woman, aged 25, while a patient in University College Hospital, under the care of Professor Walshe. On admission the woman said she had been labouring under symptoms of dysentery for two months. Eight days after entering the Hospital she passed with difficulty a very large stool, which was found to consist partly of ordinary faecal matter, and partly of a white, hard, brittle mass about the size of a hen's egg. The mass, which resembled a phosphatic calculus, was streaked with blood. On analysis Dr. Harley discovered that it consisted entirely of hardened starch. On inquiry, the patient stated that for five weeks before her admission into the Hospital she had lived chiefly on arrowroot, sago, tapioca, and ground starch made into puddings. Dr. Harley remarked that intestinal concretions were comparatively rarely met with in the human subject, and that when they did occur they usually consisted of imperfectly-digested animal or vegetable food, sometimes of a mixture of both.

A discussion followed, in which Dr. Priestley, Dr. Murchison, Dr. Harley, Dr. Gibb, and Mr. Brooke, took part, on the Artistic Manufacture of Pathological Specimens by Patients.

"At Basle," says Montaigne, "I met with a very learned Physician, Felix Platerus, who is making a book of simples, which is very nearly completed. Others have the plants painted an copied in their different colours; but he has found out the art of fixing the plants themselves very neatly upon paper, so that the smallest leaves and fibres appear exactly as they exist in nature; and he can turn over the leaves of the book without any of the plants escaping. I also saw in his house and in the public school entire anatomies [probably skeletons] of dead men."

ASCENT OF MONT BLANC.—Mr. Henry Slade, a Surgeon in the Navy, has just made the ascent of Mont Blanc, the second ever made in October.

DR. BACHHOFFNER'S STATISTICS OF SMALL-POX.—In the year 1848 the total number of deaths from small-pox in England and Wales were 6,903, and in the district of London 1,620; in 1849, deaths in England and Wales 4,645, district of London 521; in 1850, in England and Wales 4,666, district of London 355; in 1851, in England and Wales 6,997, district of London 724; in 1852, in England and Wales 7,320, district of London 1,159; in 1853, in England and Wales 3,151, district of London 211; in 1854, in England and Wales 2,808, district of London 694; in 1855, in England and Wales 2,525, district of London 1,039; in 1856, in England and Wales 2,277, district of London 531; in 1857, in England and Wales 3,936, district of London 156. These statistics showed that a total number of deaths from small-pox in ten years ending December, 1857, amounting to 45,228; and the total number for that period in the district of London were 7,010. Small-pox was a disease which could be prevented by proper vaccination, and if carried out from the beginning, as the law at present directed, 45,000 persons now dead might have been alive probably to this day.

MEDICAL NEWS.

ROYAL COLLEGE OF SURGEONS.—The following Members of the College, having been elected Fellows at previous Meetings of the Council, were admitted as such on the 13th October:—

ANDREW, HENRY, Truro
BENNETT, GEORGE, Sydney, New South Wales
HAWKINS, JAMES, Newport, Monmouthshire
HAWTHORNE, ARTHUR NEVILLE, Ecclestone
MARTIN, HENRY VICTOR, Ealing
METCALFE, EDMUND, Delamere-crescent, Westbourne-terrace
VALLANCE, JAMES THOMAS, Stratford, Essex
WILDBORE, DANIEL PEACOCK, Old-street
WILLIAMS, WILLIAM, Oldbury, Worcestershire

APOTHECARIES' HALL.—Names of gentlemen who passed their Examination in the Science and Practice of Medicine, and received Certificates to Practise, on Thursday, the 13th October:—

CREAGH, WILLIAM, Ireland
DRURY, JOHN THOMAS COCKIN, Doncaster
ELLIOTT, CHARLES HENRY, York, Swan River, Western Australia
KING, EDWARD PENDRILL, Chepstow, Monmouthshire
SANSOM, ARTHUR ERNEST, Corsham, Wilts
SMITH, JOHN, Casely
WICKHAM, WILLIAM, Tetbury, Gloucestershire

The following gentlemen also on the same day passed their First Examination:—

CATT, ALFRED, Brighton
COLLINS, JOHN BONIFACE, Yapton, Sussex
MATTHEWS, CHARLES SAMUEL, Carey-street, Lincoln's-inn
MIAL, PHILIP EDWARD, Bradford, Yorkshire
NOWELL, ARTHUR HENRY, Cambridge-villa, Richmond, Surrey

DEATHS.

AITKEN.—October 10, at Edinburgh, Thomas Aitken, M.D.
BARLOW.—October 17, Robert Barlow, of Mullingar, M.D., F.R.C.S.I.
BEAUMONT.—October 16, Thomas Beaumont, of Bradford, Yorkshire, L.S.A. 1822, an Alderman of the Borough, aged 64.
BEST.—October 9, at Rhyl, Edward Best, of Bilston, L.S.A. 1818; Justice of the Peace for the County of Stafford, aged 63.
BUBB.—August 27, at Fyzabad, Oude, Edward Bubb, Assistant-Surgeon to the 3rd Battery, 14th Brigade, Royal Artillery.
BUCK.—July 18, Benjamin Buck, of the Hutt, Wellington, New Zealand Surgeon and Coroner.
ELLIOTT.—May 22, at Ceylon, Dr. Elliott, Principal Civil Medical Officer, of Ceylon.
FRENCH.—October 2, John James French, of St. Peter-street, Islington.
GILL.—October 15, suddenly, John French Gill, of St. Patrick's Hospital Dublin, M.D.
HOWE.—October 2, at Berwick, Alexander McDonald Howe, M.D., aged 31.
JOHNSTON.—October 7, at Maryhill, Glasgow, David Johnston, C.M. Glasg. 1830; L.F.P.S. Glasg. 1843.
MCCARRON.—September 30, at New York, Dr. Patrick A. McCarron, aged 36.
NANKIVELL.—August 13, at Mooringarara, Australia, Henry Nankivell, Surgeon.
NEWBOLT.—October 13, at Camden-terrace, Bath, William Kent Newbolt, M.D., aged 67. He was son of the late Sir John Thomas Newbolt, Physician to Leopold, King of the Belgians, and served through the Peninsular War.
VAUX.—August 5, in the wreck of the steamer *Admella*, off Cape Northumberland, Australia, James Vaux, Surgeon to the *Norfolk*.
WALLIS.—August 31, at Calcutta, Edward Snell Wallis, M.D., Medical Inspector H.M.E.I.C.S.

ONE hundred and forty-seven Students of Medicine were entered at the University of Brussels for the Academic year 1858-1859.

It is related of a skilful Physician of the last century—one Vernage—that he gave up the practice of Medicine in despair, exclaiming: "I am sick of guessing!"

ROYAL COLLEGE OF PHYSICIANS.—At the Comitia Majora held on Wednesday, October 19th, David MacLoughlin, M.D., Bruton-street, was admitted a Member of the College under the temporary Bye Laws.

DR. BACHHOFFNER has been lately engaged in collecting facts regarding the number of illegitimate children born in this country. The information he had at present obtained showed that in the year 1857 every sixth child that was born was illegitimate; in the parish of St. Marylebone every ninth child was an illegitimate, and in the same year every fifteenth child that was born in England and Wales was illegitimate.

ALL men of genius, according to M. Moreau, are men in different stages of madness; genius is a neurosis.

By a decree dated the 29th August, the Surgical Society of Paris has been recognised as an establishment of public utility.

A COINCIDENCE!—The question asked by Galen, under the Emperor Marcus Aurelius: "How can the same nerve be at once motor and sensitive?" was answered by Sir C. Bell under the Emperor Napoleon I. Thus writes the Frenchman.

THE following mixture is proposed by Dr. Pacini for the preservation of blood globules, nerves, ganglions, the retina, and the white tissues generally: protochloride of mercury, 1 part; chloride of sodium, 2; glycerine, 13; distilled water, 113 parts.

SIR JAMES WYLIE, the Physician of the late Emperor of Russia, has left, by will, a large sum for the foundation of a *Clinique* at the Academy of Medicine of St. Petersburg. His executors have offered sums of 3000 roubles and downwards for the three best plans offered for the proposed building.

La Clinique Européenne has come to an untimely end. It is not a year since we announced its birth. Another journal, however, is announced: *Annales de Pathologie Générale*, under the editorship of M. Clément Olivier. Madrid also boasts a new periodical in the Medical way, called *El Especialista*.

CHARING-CROSS HOSPITAL.—A Medical Society has been formed in connexion with this School of Medicine for the discussion of subjects appertaining to Medicine and the collateral sciences. Students of any recognised Medical School are admitted as members.

THE WATERS OF VICHY.—M. Devergie has lately delivered a lecture, called a "Visit to Vichy." He therein informs those concerned that "there is no drinkable water at Vichy." Plenty of mineral waters, if you please, but none potable in the ordinary sense of the word. One of the first necessities of life is entirely wanting; the water is charged with lime, won't dissolve soap, nor cook dry *legumes*. A pleasant resort this for the gouty and gravelly inclined!

TESTIMONIAL TO MR. HOGG, OF TODDINGTON.—A numerous party of the most influential and respectable inhabitants of this town and its vicinity assembled on Friday, October 7, to partake of a dinner to which Henry Lee Hogg, Esq., Surgeon, had been invited; the object being to present him with a handsome silver salver, value £24, which amount had been raised by subscriptions, principally in small sums, by the inhabitants of Toddington and surrounding villages, as a mark of their regard for his unremitting care and attention, and as expressive of their regret at his leaving the neighbourhood.

NATURAL AND ARTIFICIAL CAMPHOR.—M. Dumont gives a ready method of distinguishing natural from the artificial camphor, with which it is so often falsified. This process is based upon the way in which liquid ammonia reacts on alcoholic solutions of the natural and the mixed camphors. When the camphor is pure and natural the solution yields, when ammonia is added to it, a slight precipitate, which is redissolved in the mixture by simple agitation; but when impure, there is thrown down by the ammonia a fleecy precipitate, which remains insoluble, this precipitate being more abundant according as the quantity of artificial camphor is greater. Artificial camphor, moreover, is soft, and has no crystalline appearance; has a less penetrating odour than the natural. Its fracture is neither friable nor granular; its solubility in alcohol is less marked.

CONVERSAZIONE AT SIR HENRY MARSH'S.—Sir Henry Marsh, Bart., the outgoing President of the King and Queen's College of Physicians in Ireland, received the members of the College resident in Dublin at a *conversazione* at his residence in Merrion-square, on Monday evening, the 17th inst. The assemblage was honoured with the presence of the Lord Lieutenant, attended by Mr. Hatchell, private Secretary, and Captain Lascelles, A.D.C. There were present to meet his Excellency, the Lord Mayor, the Lord Chancellor, Lord Talbot de Malahide, the Chief Secretary, the Lord Chief Justice of the Common Pleas, the Recorder, the Right Hon. John Hatchell, the Hon. and Very Rev. the Dean of St.

Patrick's, the Presidents of the Queen's Colleges of Belfast and Cork, the President and Vice-President of the College of Surgeons, the Dean of the Chapel Royal, Colonel Maude, Captain McClintock, R.N., the Governor of the Apothecaries' Hall, the Rev. Dr. Todd, the Rev. Professor Haughton, F.R.S. etc. etc.

CAUSES OF JAUNDICE, as given by Frerichs, are of two kinds—those which are mechanical in origin, and those in which there exists no anatomical change to account for the symptom. Of the mechanical sort, the most common is inflammation of mucous membrane of large bile ducts. Partial obstruction of the ducts may also be produced by pressure of colon distended with feces, of pregnant uterus, or of enlarged lymphatic glands. The gall-ducts may also be obstructed by their contents, by impaction of gall-stones, inspissated bile, and, very rarely, by foreign bodies—lumbrii, fruit-stones, etc., which have entered the ducts from intestine. The most intense jaundice results from complete obstruction of the hepatic duct, as through inflammatory adhesions, cicatrization of ulcers of its mucous membrane, impaction of foreign bodies, or cancerous growths. Most commonly the obliteration of the ducts is caused by external pressure on them, by cancer of pylorus, duodenum, head of pancreas, or hepatic tumours. Again, jaundice may result from cancer of liver, hydatids, abscess, etc., its intensity depending upon the number of large ducts obstructed. Tumours on the concave surface are usually accompanied with jaundice, but those on convex surface are not. The jaundice connected with heart disease, and hyperemia of liver is generally limited to slight yellow discoloration of skin and cornea. The non-mechanical causes of jaundice are mental emotions, ether and chloroform inhalation, snake-bites, purulent infection, and typhus.

PROFESSIONAL REMUNERATION.—Dr. Wm. Ogle read an interesting and important paper on this subject at the Bradford Social Science Meeting. The following is an abstract:—"A doctor is not merely 'one to be sent for in time of illness, and the sooner he is gone the better'; but he is a professional friend. The terms of agreement with him must be in strict accordance with his relation of friendship; at the same time they must fully recognise the extent of his duty, which is—to help a man to keep his health when he has it, and to recover it when he has it not. Attendance during sickness is only part of the doctor's duty. The question of remuneration is simply—How can a man establish a claim upon another for that professional assistance which he needs? The mode of remuneration is of infinitely more importance than the amount. Under exceptional circumstances, the amount may be nil, or even less than nil, without injustice; but, under all circumstances, the proper professional character must be preserved. The following mode is that which fully meets the requirements of the case. It is strictly Professional, and it offers to the public a freedom to consult the Profession which is unattainable so long as the fee is either a necessary or the rightful conclusion of every Professional visit. 1. There should be a periodical pre-payment. 2. This should give a right to call upon, or to send for one's own Medical attendant any day before a certain hour. 3. A summons after the hour agreed upon should be by fee. Terms such as these correspond precisely, and, indeed, have been suggested by the necessities of the case. Wages represent service; wages, with confidence, are the proper return for faithful service; but wages, or rather (so as to include all circumstances) an acknowledgment, confidence and consideration: these are the essential characteristics of an agreement with a Professional friend."

M. GERARD TEULON ON RELIGIOUS REVIVALS.—"The human mind in its progress towards perfectibility may well offer us, from time to time, ameliorated types, amongst which the heavenly fire of moral and intellectual progress shines brilliantly. But amidst these we still see spread before us the level of our infirmities. We must not despise the populations of the middle ages; in the fourteenth century we find the torrent of dancers of St. Guy; in the seventeenth century, we see men rushing to the tomb of St. Médaid, just as in the ages of antiquity they rushed to the mysteries of Cybele. We have their equivalents. By the side of marvels of industry engendered by the genius of our age, the nineteenth century

offers us in the centres of civilisation, epidemics of chorea; the dancers of Strasburg and Ulm have now their counterparts in the hysterics of Belfast and Cornwall." The evident cause, according to this French observer, of these hysterics is the influence of fanatical sermons preached to poor young girls, who have been subjected already to the other depressing agencies of misery and excessive labour!

VITAL STATISTICS OF LONDON.

Week ending Saturday, October 15, 1859.

BIRTHS.

Births of Boys, 822; Girls, 805; Total, 1627.
Average of 10 corresponding weeks, 1849-58, 1543.2.

DEATHS.

	Males.	Females.	Total.
Deaths during the week	455	447	902
Average of the ten years 1849-58 .. .	523.3	512.1	1035.4
Average corrected to increased population

METEOROLOGY.

From Observations at the Greenwich Observatory.

Mean height of barometer	29.492 in.
Mean temperature	55.3
Highest point of thermometer	66.0
Lowest point of thermometer	45.7
Mean dew-point temperature	53.4
General direction of wind	E.
Whole amount of rain in the week	0.88
Amount of horizontal movement of air in the week ..	305 miles.

TO CORRESPONDENTS.

We very much regret that another postponement of Dr. Simpson's Lecture on Ovarian Disease is unavoidable, as we have not yet received the corrected proof.

Mr. Crosbie.—Next week.

Mr. Sharp.—Many thanks.

Dr. Bishop.—The paper has not been laid aside.

Peter.—It is the duty of the registrar to call at the house.

Dr. West's case of Inverted Uterus shall appear next week.

Mr. Knapp's letter on the Abuses of Medical Charities shall appear next week.

Dr. Cuthbert's interesting paper on the Prominent Features of the Ulster Revival shall appear next week.

Mr. Parks.—A Dentists' Journal has just been started at Philadelphia under the modest title of *Cosmos Dental*.

P. Q. seems to forget that successive Boards of Admiralty have set at naught the Order of Council of 1805 for more than fifty years.

Mr. Harle.—We are unwilling to continue any discussion on the political aspect of the Opium Question. Any communication as to the physiological effects of its consumption on the Chinese is strictly within our province.

A Subscriber.—In making income-tax returns it is usual to deduct a part of the rent for such a portion of the house as is used for professional purposes exclusively, and the whole for the carriages, assistants, or any other expense incurred exclusively for the carrying on of practice.

M. Roger.—"Compatriot and cotemporary of Sir Walter Scott, Charles Bell was the youngest son of a poor Protestant clergyman, who with an annual salary of £26 sterling (600fcs.) accomplished the miracle of bringing up four sons and making four celebrated men."

Mr. Low.—In certain syphilitic affections of the tongue, doubtful as to their secondary or tertiary character, M. Ricord uses and finds most efficacious the following formula:—Biniodide of mercury, 15 centigrammes; iodide of potassium, 15 grammes; syrup of gum, 5000 grammes. A gramme is 15 grains.

A Subscriber.—The advertisement of John Watson, the Clothier and Cancer Curer of Ayr, is a lamentable evidence of the ignorance of the public; but so long as he calls himself *Clothier* and does not pretend to be a *Surgeon*, there is no law to protect the public. If they choose to be treated by a clothier they must take the consequences.

No Specialist.—A Dr. Joux speaks thus of the Société de Chirurgie of Paris:—"The members of the Society are skilful operators; but when I carefully look into their practice, I soon perceive that anatomisme pervades them; they possess no Medical philosophy; as to any precepts of true hygiene, not a trace is to be found. In a word, with them every thing is local."

Mr. George.—We are told that it is to an actor and a monkey that we owe the first precise information concerning the motor power of the facial nerve. Sir C. Bell noticed that there was in London the comedian, Liston, who had the talent of expressing all the passions with one side of his face only, the other side remaining perfectly motionless. He then cut the facial nerve on one side of the face of the most expressive monkey at Exeter Change, and observed at once the same discordance as in the features of the actor.

FEIGNING DISEASE.

TO THE EDITOR OF THE MEDICAL TIMES AND GAZETTE.

SIR,—A policeman in this metropolis wishing to leave the force claimed £20 gratuity (in consequence of having something better promised him), he set about the following trick which was very successful. He complained of severe pain in the thorax with difficulty of breathing. The divisional Surgeon examined him, applied a blister, and advised perfect rest and good nourishing diet. Instead of good diet he almost starved himself, which, of course, soon reduced him a few pounds in weight, and made the case appear more serious. The Surgeon finding the case hopeless, transferred him to the Physician, who pronounced him unfit for duty, and recommended his discharge.—the very thing he wanted, and after receiving the £20 he changed his diet to beef and mutton, and was soon as good a man as he was before the application of the blister.

I am, &c.

ONE WHO KNEW HIM.

THE VACCINATION ACT.

TO THE EDITOR OF THE MEDICAL TIMES AND GAZETTE.

SIR,—As this subject is discussed by Mr. Griffin and Dr. Sullivan, with a view to the best way of carrying out the Act, permit me to mention that in the borough of Stroud, Gloucestershire, from the very few and irregular returns by the Registrars, the Board of Guardians, under their excellent Chairman, Mr. Dickenson, have taken upon themselves the laudable responsibility of enforcing the Act, by ordering the relieving officers to report and bring forward any cases represented from the Union Surgeons or other Medical men as refusing to comply with the Act. Also, that the Union Surgeons shall vaccinate the children at their homes, and look after them, so as to insure more certain efficiency, and maintain a more regular supply of lymph. If this plan be adopted generally by Boards of Guardians, may I ask what more is wanted?

I am, &c.

PUBLICOLA.

THE TITLE OF DOCTOR.

TO THE EDITOR OF THE MEDICAL TIMES AND GAZETTE.

SIR,—The *quæstio venata* of Medical titles being again revived, perhaps you will give me some space for a few remarks, the last I shall offer on this much-agitated subject. "Any person who shall wilfully and falsely pretend to be, or take, or use the name or title of a Physician, Doctor of Medicine, Licentiate of Medicine and Surgery, Bachelor of Medicine, Surgeon, General Practitioner, or Apothecary, etc. etc." The title of "Doctor" not being included in the above list (the words of the Act are "Doctor of Medicine"), its assumption by thenon-graduated Physician as a prefix, established by long usage and courtesy, is certainly not an infringement of the statute. If it were so, the D.D., LL.D., D.C.L., etc. using this prefix might be liable to prosecution, which would of course be absurd. Again, if the above-cited words be taken in their literal acceptation the M.D. could not legally assume the title of Physician. Listen to this, ye Southampton M.D.'s, *et hoc omne genus*. My views on the concluding portion of the fortieth section have been already published in your valuable and impartial Journal.—*Verbum non amplius addam*.

I am, &c.

JOHN E. SMYTH, B.A., LL.R.C.P.E.
2, China-terrace, Lambeth, October 17, 1859.

SALE OF DEGREES.

TO THE EDITOR OF THE MEDICAL TIMES AND GAZETTE.

SIR,—In the two last numbers of your excellent Journal, of which I am happy to say I am a regular reader, I observe reference made to the selling of Medical degrees in the United States, and that, apparently winked at, if not even sanctioned by the best Universities on the American continent. As a Medico, I have travelled through every portion of the United States, and with pleasure can add, that I was everywhere received with that kindness and courtesy which invariably characterizes the people of the Western Hemisphere.

Though not an American Graduate, I am intimately acquainted with their institutions and collegiate regulations, and am positive that no College or University, either Medical or otherwise, of either standing or respectability over granted diplomas to persons, unless obtained in a legitimate manner. Even were I to admit that such things have been done, is it much to be wondered at, when the mother country sets us such an example? Cannot any one in Glasgow, who has never even been out of Scotland, obtain the degree of the University of Erlangen?

If, then, such things are permitted to go on in a country whose laws and customs are such as would tend to the suppression of everything that was not just and honourable, is the occurrence of like proceedings in a newer and probably less informed world, to be wondered at? I should

certainly take the mote out of my own eye, ere I commenced to look for the same in my brother's.

I am, &c. A CANADIAN M.D.

COD-LIVER OIL CAKES.

TO THE EDITOR OF THE MEDICAL TIMES AND GAZETTE.

SIR,—In your last week's number, page 369, you give an extract of a process, suggested by M. Bassi, for the purpose of rendering cod-liver oil palatable.

We beg to inform your readers that we have already effected this, and in a manner essentially the same as M. Bassi proposes. In your paper of 12th February last, you reported upon our preparation as follows:—"We have examined a specimen of gingerbread made by Messrs. Newbery, each cake containing a teaspoonful of cod-liver oil. The gingerbread is extremely light and pleasant, the flavour of the oil being completely covered."

Should your readers desire to try M. Bassi's preparation, they will find in ours a representative, without the trouble of adopting the elaborate process suggested by the French Medical man.

Our cod-liver oil cakes have been largely inquired for by Medical Practitioners, and their sale testifies to their great utility.

I am, &c. F. NEWBERRY AND SON, by A. W. B. NEWBERRY.

45, St. Paul's Churchyard, October 12, 1859.

REMOVAL OF WARTS.

TO THE EDITOR OF THE MEDICAL TIMES AND GAZETTE.

SIR,—Among your Notices to Correspondents, I find a request that any Surgeon acquainted with a successful method of eradicating cutaneous warts will communicate the same through the medium of your Journal; and since I have never found the following application to fail if duly followed out, I would suggest to your correspondent that he give it a trial:—

Let an ointment be made with equal parts of pulv. lyttæ and pulv. sabine, and as much ung. cetacei as is just necessary to form an ointment of them, and let each wart be kept constantly and assiduously covered with a little of the ointment spread on lint for a few days or a week (a little longer if the warts be very large), and by that time a thin line of blistered surface will be found surrounding the base of the wart: a flat probe inserted under the edge will then lift off the wart entire and leave the true skin exposed, and in a healthy condition.

I am, &c.

C. G. WHEELHOUSE.

16, East Parade, Leeds, October 5, 1859.

THE EDINBURGH LICENCE.

TO THE EDITOR OF THE MEDICAL TIMES AND GAZETTE.

SIR,—In your number of the 8th inst. you say a "Correspondent" informs you that sixty licences were disposed of at the Edinburgh College of Physicians on Tuesday week last. I think you will find he is misinformed on the subject, as the day for examination is Wednesday, and no licences are now granted without examination. I went up myself on Wednesday, October 5, and had a very fair written and *visd voce* examination, each lasting about an hour; there were five others besides myself, making six, to which perhaps your correspondent has added a cypher. The reason I applied for an Edinburgh Licence was this; I had been for some time working up for the London licence, but being in practice as a General Practitioner I found it would take more time than I could spare, more particularly the six days in London, whereas I could run the risk of being away from my practice for three days, but I should never have gone to Edinburgh unless they had altered their regulations and given an examination; as I considered, and still consider, granting any licence without examination illegal according to the Medical Act, and if the Edinburgh College still do so, it is in direct opposition to their advertisement, and that they could examine sixty applicants at one sitting is going, I think, rather too far. My conscience is quite easy with regard to getting the licence of the Edinburgh College, because I feel quite satisfied that, holding the Hall and College qualification, I am quite as much entitled to the English licence as he who has the M.R.C.S. and M.D. St. Andrew's, also having been twenty years in practice. Had the Edinburgh College in the first instance granted their licence to Medical Practitioners only, say thirty years of age, with both a Medical and Surgical qualification, they would have had more applicants and kept it much more select. Every Physician ought to be a Surgeon; what says the King of Poets, "A wise Physician, skilled our wounds to heal," etc.

October 11, 1859.

I am, &c. M.R.C.S. and L.S.A.

DR. BARKER AND MR. CHAVASSE.

TO THE EDITOR OF THE MEDICAL TIMES AND GAZETTE.

SIR,—To have to intrude in your columns again, in reply to Mr. Chavasse, is to me extremely painful. The more so because I feel the matter in dispute to be, in a scientific point of view, contemptible, its discussion derogatory to both combatants, and to your readers a grievous infliction. This then shall be my final reply, and it shall be brief.

1. While I have no such sufficient estimate of Mr. Chavasse's profoundest philosophies to care about pirating them; I could not touch his weakest sentiment without acknowledgment, if I felt that such sentiment were his and his alone. In all my writings nothing has caused me more anxiety than the endeavour to render just acknowledgment of all works and labours to which I have had recourse. I owe most of my best friendships in the scientific world to this simple and merely honest line of conduct.

2. In my last letter (if the provocation into which Mr. Chavasse had roused me, did not destroy my meaning), I explained that some of the passages which he had given, while not in a strict sense claimable by him as original in idea, were by the accidental transfer of a foot-note from a little work on the Diet of Infancy, to the larger work on the Hygienic Management of Infants and Children, put forward as my own. I offered then, in a new edition of my work, to place this claim of Mr. Chavasse's on a correct footing; making him every due acknowledgment. More I could not do. Less I shall not do, whatever course Mr. Chavasse may follow. In the next edition of my book, Mr. Chavasse shall take his exact level in the list of authors on the subject considered.

3. Mr. Chavasse's last accusations I entirely repudiate. His method of proving a plagiarism is original to the last degree, and for it I give him full credit. By the same original plan that namely of culling out of the page of another author one sentence, the meaning of which could only be expressed in one way, as for instance, "wet feet are a cause of cold," or "the heads to be kept cool," and making of this a plagiarism because he

himself has somewhere expressed the same thought,—by the same plan, I repeat, I could prove with equal ease that Mr. Chavasse must have stolen a good many sentences from Galen, for which he in his turn is indebted to Hippocrates.

The following is an illustration of the mode in which a charge of plagiarism may be concocted. On the temperature of the nursery, I have made the following remarks, but the italicised passages Mr. Chavasse has carefully omitted to insert. "A good thermometer, (this precaution is necessary, for the instruments commonly sold are often found to be worthless,) should be considered an indispensable appendage to the nursery. In recommending the use of the thermometer, I do not intend to imply that all its minute variations must be attended to, so as to lead us to alter the dress or abridge the open-air exercise of children on account of slight changes of temperature; but this simple instrument might with great advantage be more generally used to indicate the more important or the wider and more abrupt changes from heat to cold and vice versa, to which our climate is liable." We both allude to the temperature of the nursery, and so do twenty other writers on the subject, but Mr. Chavasse mutilates my passage on the thermometer in order to charge me with plagiarism. So with the other passages. He has very disingenuously omitted many important lines, and twisted and turned the extracts in such a way that I had great difficulty in finding them out. The middle of one paragraph he has placed as the commencement, in order to suit his own views; and has inserted a full stop in the middle of another sentence where there is simply a comma, followed by other important lines, which he has omitted, and which could not be omitted without mutilation.

4. Mr. Chavasse makes the extraordinary statement that "twenty years ago there was scarcely a work written on the maternal management of infants and children." To enumerate a tithe of the writers who have preceded him in this department would be a laborious task. It would not, however, be profitless for Mr. Chavasse to do this, inasmuch as he would see how he has been forestalled in almost every sentence he has written. As the subject is his "favourite study," this interesting Bibliographical exercise may be left in his hands. Anyway, he must pardon me if I decline to do it for him.

I need add no more, Sir. If an apology, scarcely required, which I at once tendered to Mr. Chavasse, together with the most liberal offer I could make, is no satisfaction to him; if the assertion, perfectly correct, that I have not, and could not have, any object or intention of doing him a wrong, is unavailing, he must wait for the rest. I have done with the matter.

I am, &c.

HERBERT BARKER, M.D.

[We have now published two letters for each of the disputants. We cannot afford further space for the discussion.—Ed.]

APPOINTMENTS FOR THE WEEK.

October 22. *Saturday (this day).*

Operations at St. Bartholomew's, 1½ p.m.; St. Thomas's, 1 p.m. King's, 2 p.m.; Charing-Cross, 1 p.m.

24. *Monday.*

Operations at the Royal Free Hospital, 1 p.m.; Metropolitan Free Hospital, 2 p.m.

MEDICAL SOCIETY OF LONDON, 8 p.m. "Clinical Discussion."

25. *Tuesday.*

Operations at Guy's, 1 p.m.; Westminster, 2 p.m.

WESTERN MEDICAL AND SURGICAL SOCIETY OF LONDON, 8 p.m. Soirée.

26. *Wednesday.*

Operations at University College Hospital, 2 p.m.; St. Mary's, 1 p.m. Orthopædic Hospital, 2 p.m.; Middlesex, 12½ p.m.

27. *Thursday.*

Operations at St. George's, 1 p.m.; Central London Ophthalmic, 1 p.m. London, 1½ p.m.; Great Northern, 2½ p.m.

28. *Friday.*

Operations, Westminster Ophthalmic, 1½ p.m.

EXPECTED OPERATIONS.

King's College Hospital.—The following operations will be performed this day (Saturday):—

Mr. Ferguson—Closure of Opening into Bowel; Dislocation of Elbow (2 cases); Varicose Veins; Necrosis of Finger. Mr. Wood—Ligature of Nævus.

The London School of Dental Surgery,

32, SOHO-SQUARE.

This School has been organised in conformity with the requirements of the Charter granted by the Royal College of Surgeons of England, empowering that Corporation to conduct Examinations, and to grant Diplomas of Proficiency in Dental Surgery.

The Lectures upon the subjects specially pertaining to Dental Surgery will be given during the Summer Medical Session, in order that Students may be at liberty to attend at any of the existing Medical Schools those Lectures enjoined by the Curriculum upon subjects which are not peculiar to Dental Surgery.

The Hospital is now open for the reception of pupils, who will receive instruction daily under the superintendence of the Dental Officers.

DENTAL HOSPITAL ATTENDANCE.

- 9 a.m.—Monday—W. A. Harrison, Esq., F.R.C.S.
 11 a.m.—Tuesday—Samuel Cartwright, Esq., jun., M.R.C.S.
 11 a.m.—Wednesday—John Tomes, Esq., F.R.S., M.R.C.S.
 11 a.m.—Thursday—Thomas Underwood, Esq.
 11 a.m.—Friday—Charles Rogers, Esq.
 11 a.m.—Saturday—Robert Hepburn, Esq.

Fee for Two Years' attendance, £15 15s.

The following are the Special Lectures:—

Dental Anatomy and Physiology (Human and Comparative)—G. A. Ibbetson, Esq., F.R.C.S., F.G.S.
 Dental Surgery and Pathology—Samuel Cartwright, Esq., jun., M.R.C.S.
 Mechanical Dentistry, with Practical Illustrations—R. Hepburn, Esq.
 Metallurgy—G. Makins, Esq.
 General Fee—Two Courses of Dental Anatomy, Dental Surgery, Mechanical Dentistry, and Metallurgy, £15 15s.
 Further particulars respecting the arrangements of the School may be obtained by application to the Assistant-Secretary of the Dental Hospital, 32, Soho-square.

India Risk Assurances. — Family

ENDOWMENT LIFE ASSURANCE and ANNUITY SOCIETY, Established 1835, empowered by Special Act of Parliament. Head Office, 43, New Bridge-street, London, E.C., with Branches and Agents at Calcutta, Madras, Bombay, Agra, and Hongkong, as well as throughout the United Kingdom.

Subscribed Capital, Half-a-Million. Annual Income, upwards of £50,000. Accumulated Invested Fund, £200,000.

This Society transacts every description of Assurance business, and offers to Insurers great facilities and advantages, combined with perfect security.

Eighty per cent. of the profits belong to the assured.
 Parties about to proceed to India may effect insurances on highly favourable terms, and are invited to examine the Society's general and special advantages, as set forth in the prospectus of the Indian Branch.

Active Agents are required in all districts not efficiently represented, to whom liberal commissions will be allowed, and at the death of an agent one-half of the ordinary renewal commissions of the agency will (under a fixed condition), be continued to his widow or other nominee during life.

Medical men introducing business to the Society are allowed the same Commissions as are allowed to Solicitors.

Applications for agencies, prospectuses, and further information may be addressed to

EDWIN H. GALSORTHY, Actuary and Secretary.

Private Establishment for the Insane,

CHURCH STRETTON, near SHREWSBURY. This Establishment is conducted by the Resident Proprietor, Dr. S. G. BAKEWELL, Son of the late Mr. Bakewell, of Spring Vale, Staffordshire.

The Ladies occupy a separate residence, and are under the immediate care of Mrs. Bakewell.

The neighbourhood of Church Stretton is very picturesque and healthy. Its similarity to Malvern is often noticed.

A Carriage is kept for the use of the inmates.
 References can be given to Medical Gentlemen and others in Shrewsbury, Birmingham, Hereford, and throughout Staffordshire.

Those who cannot swallow Cod-Liver

OIL in its crude state should try NEWBERRY'S COD-LIVER OIL CAKES.—"The gingerbread is extremely light and pleasant, the flavour of the oil being completely covered."—Medical Times, Feb. 12th, 1859. Packets, 1s. 9d. and 3s. F. NEWBERRY and SONS (Proprietors of the "PULVIS JACOBI VER., NEWBERRY'S," 45, St. Paul's Churchyard, London. ESTABLISHED A. D. 1746.

Medical, Invalid, and General Life

[ESTABLISHED 1841.]

OFFICE, 25, Pall-mall, London.—Empowered by special Act of Parliament

At the SEVENTEENTH ANNUAL MEETING, held on the 25th November, 1858, it was shown that on the 30th June last.—

The number of Policies in force was 6083

The Amount Insured was £2,551,136 6s. 6d.

The Annual Income was nearly £120,000

The new Policies issued during the last five years are as follows:—
 5411 Policies for £2,599,658, yielding £110,624, in Premiums, showing an average yearly amount of new business of more than

HALF A MILLION STERLING.

The Society has paid claims on 1002 Policies, assuring £426,044, since its establishment in 1841.

Assurances are effected at home or abroad on healthy lives at as moderate rates as the most recent data will allow.

INDIA.—Officers in the Army and civilians proceeding to India, may insure their lives on the most favourable terms, and every possible facility is afforded for the transaction of business in India.

INVALID LIVES assured on scientifically constructed tables based on extensive data, and a reduction in the premium is made when the causes for an increased rate of premium have ceased.

MEDICAL MEN are consulted in every case, and are paid a Guinea for each Report, and receive the same advantages as Solicitors for any business they may introduce.

Policies issued free of stamp-duty, and every charge but the premiums. In the event of death during the days of grace, the risk binding on the Society if premium paid before the days of grace expire.

Every information may be obtained at the chief office, or on application to any of the Society's agents. C. DOUGLAS SINGER, Secretary.

Blancard's Pills of Unchangeable

IODIDE OF IRON.

Recommended by the Academy of Medicine of Paris, And authorised by the Medical Council of St. Petersburg, Extensively tried in the Hospitals of France, Belgium, Ireland, Turkey, &c. Favourably noticed at the Universal Exhibition of New York, 1853, and Paris, 1855.

"Of all the modes hitherto proposed of administering iodide of iron in the pure state, I think Mr. Blancard's the best."—Chemistry applied to Therapeutics, by M. Mialhe, Deputy-Professor to the Faculty of Medicine of Paris, Pharmacien to the Emperor, 1856, p. 319.

These Pills stand now very high in the therapeutics of every country, as may be seen by the above quotations, and also by the numerous scientific articles in medical periodicals and works (a).

Being enveloped in a very thin resino-balsamic coating, they present the great advantage of not being liable to any deterioration, of having no taste, of being small, and not distressing the stomach. As they possess the properties both of iodine and iron, they are especially beneficial in chlorotic, scrofulous, tubercular, or cancerous affections, as also in leucorrhœa, amenorrhœa, anemia, &c. &c. and they furnish the medical man with an excellent means of modifying lymphatic, feeble, and debilitated constitutions. Dose, 2 to 4 pills a day.

N.B.—Impure or altered Iodide of Iron is an unsafe remedy, and may even prove dangerous. Only such bottles as bear an electro-plated seal fixed to the lower part of the cork, and the signature of the inventor placed on a green label, are to be considered as prepared by Mr. Blancard. The public should beware of spurious imitations.

To be had at M. BLANCARD'S, Pharmacien, Rue Bonaparte, No. 40 Paris. General dépôt in England at M. Gabriel Jozeau's, French chemist 49, Haymarket, London. In Ireland, at Mr. Vitties, Stevens's Hospital Dublin. In the United States, at E. and S. Fougere, Chemists, 30, North William-street, New York. To be obtained retail from the principal Chemists.

(a) Bulletin de l'Académie de Med 1850, page 1015; Gazette Médicale, Aug. 17, 1850; Union Médicale, Aug. 15 and 22, 1850; Gazette des Hôpitaux, March 15, 1853, and June 10, 1854; Gazette Hebdomadaire de Médecine et de Chirurgie, Aug. 31, 1855; Revue de Thérapeutique Médico-Chirurgicale, Feb. 15, 1855; Abeille Médicale, Revue Clinique; Répertoire de Chimie et de Pharmacie; Annuaire de Thérapeutique pour 1851, page 199; Orfila, Elements of Chemistry; Mialhe, Chemistry applied to Therapeutics, 1856, p. 319; Quevenne, Essay on the Physiological and Therapeutic Action of Preparations of Steel, page 97, 1854; Bricheteau, Treatise on Chronic Diseases seated in the Respiratory Organs; Soubeiran Treatise on Pharmacy; Dorvault, Officine, &c. &c.

POULTICES SUPERSEDED! SPONGIO PILINE.

The Profession are respectfully

informed, that the WANDLE FELT COMPANY having purchased Mr. MARKWICK'S PATENT for the well-known SPONGIO PILINE, for the application of moist heat, in lieu of Poultrices and Fomentations, and the IMPERMEABLE PILINE, for Rheumatism, for promoting perspiration, and for the application of stimulating liniments, are now supplying these articles, of superior manufacture, and at greatly reduced prices, at 27, BEDFORD-BURY, COVENT-GARDEN, London, and also through the Wholesale and Retail Druggists in town and country.

Surgical Instruments, and every Im-

plement necessary for Surgeons and Druggists, can be had (warranted best quality and moderate prices), retail as well as wholesale, from the Manufacturer, JAMES ARNOLD, 35, WEST SMITHFIELD, St. Bartholomew's Hospital, London.

Single Circular Truss, 2s. 6d.; double ditto, 5s.; on Salmon's Expired Patent, 4s. 6d.; double ditto, 9s.; on Coles's Expired Patent, 5s.; double ditto, 10s.; Cotton Net Suspensory Trusses, from 10d.; Elastic Stocking Net bandage, 4d. per yard; Case of Tooth Instruments, £1; Case of Cupping Instruments, £2 13s. 6d.; Case of Pocket Instruments, £1; Brass Enema Syringe, complete mahogany case, 10s. and 12s.; Case of Dissecting Instruments, Ivory Handles, 15s.; best Bleeding Lancets, per dozen, 18s.

Crosse and Blackwell, Purveyors in

Ordinary to Her Majesty, respectfully invite attention to their PICKLES, Sauces, Tart Fruits, and other table delicacies, the whole of which are prepared with the most scrupulous attention to wholesomeness and purity. The practice of colouring pickles and tart-fruits by artificial means has been discontinued, and the whole of their manufactures are so prepared that they are not allowed to come in contact with any deleterious ingredient. A few of the articles most highly recommended are, Pickles and Tart Fruits of every description, Royal Table Sauce, Essence of Shrimps, Soho Sauce, Essence of Anchovies, Jams, Jellies, Orange Marmalade, Anchovy and Bloater Pastes, Strasbourg and other Potted Meats, and Calf's-Foot Jellies of various kinds for table use. C. and B. are also sole agents for M. Soyer's Sauces, Relish, and Aromatic Mustard; and for Carstairs' Sir Robert Peel's Sauce, and Payne's Royal Osborne Sauce. The above may be obtained of most respectable Sauce Vendors throughout the United Kingdom; and Wholesale of

CROSSE and BLACKWELL, 21, Soho-square.

IMPORTANT TO THE PROFESSION.

19, Goodge-street, Tottenham-court-road, London.

Mr. Howard, Surgeon-Dentist, 52,

FLEET-STREET, has introduced an entirely NEW DESCRIPTION OF ARTIFICIAL TEETH, fixed without Springs, Wires, or Ligatures. They so perfectly resemble the natural teeth as not to be distinguished from the original by the closest observer; they will NEVER CHANGE COLOUR or DECAY, and will be found very superior to any teeth ever before used. This method does not require the extraction of roots, or any painful operation, and will give support and preserve teeth that are loose, and is guaranteed to restore articulation and mastication; and that Mr. Howard's improvements may be within the reach of the most economical, he has fixed his charges at the lowest scale possible. Decayed Teeth stopped and rendered sound and useful in mastication.
52, Fleet-street. At home from Tentill Five.

W. Twinberrow begs to draw the

attention of the Medical Profession to his EXTRACT OF INDIAN HEMP, prepared expressly for him at Calcutta, its peculiar sedative properties being so beneficial where opiates are inadmissible. Also to his MEDICINAL EXTRACTS, prepared from the fresh plants (Hyoscyamus Niger, Conium Maculatum, Atropia, Belladonna, Crotalaria, etc.). Also to his Liq. Taraxaci, Liq. Galli Aparinis (a valuable alternative), Liq. Parietariae (diuretic), and Liq. Beloe (prepared from the Egle Marmelos, or Indian Bael), for dysentery and diarrhoea. W. T. has a large supply of INDIAN BAEL on hand. 2, Edwards-street, Portman-square.
BOUDAULT'S PEPSINE imported in original bottles. Ext. Laricis Europ.

South African Sherry, 19s. 6d. Port,

22s. Claret, 18s. Madeira, 24s. Amontillado, 26s. Cognac, 18s. 6d. Her Majesty's Wine Merchant. Specially appointed since May, 1840.

J. & E. BRADSHAW, late

Shoolbred and Bradshaw, 34, Jermyn-

STREET, begs to call attention to the various improvements in PATENT ELASTIC STOCKINGS, BELTS, KNEE-CAPS, SOCKS, and Ladies' and Gentlemen's SPINE-SUPPORTERS. A new description of BELT invaluable for prevention of Cholera, and the cure of Rheumatism, Lumbago, &c.—N.B. Every description of INDIA-RUBBER BANDAGE, vulcanized on the newest principle.
Directions for measurement sent by post. N.B. A liberal Discount to the Profession.

A female to attend on Ladies.

Human Osteology from France,

RAGINEL, 38, Ludgate-hill, City, E.C., London. Patronised by the Royal College of Surgeons of England. Illustrated Osteology on the bones themselves. Very large Stock on the lowest possible terms. Disarticulated Skulls, in twenty-two pieces, in box. All the bones of the disarticulated skulls will be fitted in right order in the presence of the purchaser so as to show that every bone of each set belongs to the same Skull; it will be the same for all other disarticulated pieces. Skulls with Sections. Hands and Feet on catgut. Disarticulated Skeletons, quite complete, with the Skull same body. Articulated Male Skeletons, the bones very well marked. STUDENT'S CASE OF OSTEOLOGY, COMPLETE.
Splendid Pieces for Lecturers and Museums.

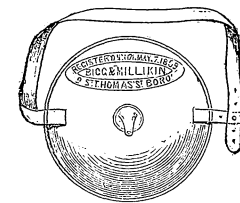

Professors of Anatomy and

STUDENTS

are invited to inspect the Stock of Skeletons, Skulls, separated and entire—Vertebrae, Hands and Feet on catgut, and various loose bones, which are well prepared, perfectly white, and free from grease or smell. The selection of this stock having been made by a good Anatomist, W. M. can confidently recommend them as being well marked, perfect bones, at low prices.

W. MATTHEWS, 8, Portugal-street, Lincoln's-inn-fields, London.

Registered No. 4171,

May 7th, 1859, by BIGG & MILLIKIN, 9, St. Thomas-street, Borough, MADAME HARRIOTE'S MAMMARY FEEDING BOTTLE, or Artificial Breast, by which an infant can receive its food in the most natural position, and be deceived by its pliable and soft texture. It has many advantages that none but a mother can appreciate.—To be had only at BIGG & MILLIKIN'S, Instrument Makers to Guy's and St. Thomas's Hospitals, 9, St. Thomas-street, Borough.

Pratt's Artificial Leg.

J. PRATT begs to call the attention of the Profession to the following Testimonial, just received:—

"Somerset,

June 20th, 1858.

"DEAR SIR,—It affords me much pleasure in being able to state that the Artificial Leg which you supplied me with is far beyond my best anticipations. From its being so LIGHT in WEIGHT, and its action in the foot so natural, I can walk, or ride on horseback, with ease and comfort; and few indeed would detect it as being other than natural. It has given me full satisfaction.

I am, dear Sir, yours very truly,
J. W.

To Mr. J. Pratt,
Surgical Instrument Maker,
420, Oxford-street."

TRADE MARK.

Brown & Polson's Patent Corn Flour,

preferred to the best Arrowroot. DELICIOUS IN PUDDINGS, CUSTARDS, BLANCMANGE, CAKE, &c., and especially suited to the delicacy of CHILDREN and INVALIDS.

The Lancet states—"This is superior to anything of the kind known."

Trade Mark and Recipes, on each Packet, 4, 8, and 16 oz.

Obtain it from Family Grocers, Chemists, &c.

77a, Market-street, Manchester; and 23, Ironmonger-lane, London.

DR. DE JONGH'S

(Knight of the Order of Leopold of Belgium)

LIGHT-BROWN COD-LIVER OIL.

OPINION OF

EDWIN LANKESTER, Esq., M.D., LL.D., F.R.S.,

Late Lecturer on the Practice of Physic at St. George's Medical School, Superintendent of the Food Collection at the South Kensington Museum, &c. &c.

"I have much pleasure in bearing testimony to the excellent qualities of the Cod-liver Oil prepared under the superintendence of Dr. De Jongh, of the Hague. I believe that the purity and genuineness of this Oil are secured in its preparation by the personal attention of so good a Chemist and intelligent a Physician as Dr. De Jongh. He was the first Chemist who gave an accurate analysis of the Cod-liver Oil, and the discoverer of an organic substance which it contains."

He has also written the best Medical treatise on the Oil with which I am acquainted. Hence I should deem the Cod-liver Oil sold under his guarantee to be preferable to any other kind as regard genuineness and medicinal efficacy.—S, Savile-row, W., August 1st, 1859."

SOLE CONSIGNEES AND AGENTS,

ANSAR, HARFORD, & CO., 77, Strand, London, W.C.

WALTERS' INDIA-RUBBER URINALS.

F. WALTERS having originally invented these Urinals, begs to warn the Profession of the many bad and useless imitations which are now sold, and he would advise them, before purchasing, to look that they are stamped with his name; as, unless that be the case, he cannot guarantee them.

These conveniences are made for those who require them only occasionally, during a long journey, as well as for those invalids who use them always. Mr. WALTERS has much improved them by making them of *Etherised India-Rubber*, which adds very greatly to the strength of the India-Rubber, at the same time that it prevents its sticking together; by this means he is enabled to make them less stiff and harsh than hitherto, and yet to retain all the advantages of that stiffness. There is a patent valve, which prevents the return of the fluid; and they may be worn either sitting, walking, or lying, without the slightest inconvenience, and without being perceived by any one.

WALTERS' CONVENIENCES FOR LADIES will be found particularly useful during pregnancy. They are perfectly soft and flexible, and may be worn with perfect comfort.

All Orders must be accompanied by a Post-office order or reference.—Entrance for Ladies at the private door, where a Female attends.

MANUFACTURER OF ELASTIC STOCKINGS, BELTS, &c.

16, MOORGATE STREET, NEAR THE BANK, LONDON. E.C.

WATER BEDS.—EDMISTON and SON, 5, Charing-Cross, beg to call

the particular attention of the Managers of Hospitals and Dispensaries, and the Medical Profession generally, to the prices and quality of their Hot or Cold Water Beds. The prices hitherto charged being so high as to limit the sale of such articles to the affluent, they are induced to offer them at such prices as will enable the public generally to realise the advantage and comfort to be derived from their use.

WATER BEDS, £3 13s. 6d., £5 5s., and £6 16s. 6d.

Water Pillows and Cushions, 7s. 6d. to 21s. Urinals, from 3s. 6d. to 12s. 6d. Cotton Elastic Stockings, 4s. 3d. Silk, 5s. 3d. Knee Caps, Leggings, Anklets, &c.

BED SHEETS, ACCOUCHMENT BELTS, &c.

India-Rubber Chamber Utensils for Lunatic Asylums, 7s. 6d. each, or 75s. per dozen.

WATER BEDS ON HIRE. TERMS, 7s. 6d. PER WEEK.

LONDON: EDMISTON AND SON, 5, CHARING-CROSS, LATE 69, STRAND.

Struve's Seltzer, Marienbad, Vichy,

KISSINGEN, and other MINERAL WATERS.—Under her Majesty's especial Patronage.—ROYAL GERMAN SPA, BRIGHTON, STRUVE'S PUMP-ROOM and PROMENADES, offering every facility for a Course of Mineral Waters, as perfect and beneficial as at the natural springs, are NOW OPEN, for the Thirty-fifth Season. A prospectus, with the highest Medical testimonials, may be obtained gratis, at the Pump-room, or from George Waugh and Co. Chemists to the Queen, 177, Regent-street (westside), London, and other respectable houses in London and the provincial towns, where orders for Struve's Bottled Mineral Waters continue to be executed.

CAUTION.—The success obtained by Struve's Mineral Waters, owing to their perfect identity with those of the natural springs, has induced several parties to attempt imitations, sold as "Brighton Seltzer," "Brighton Vichy," &c., an analysis of some of which has shown an utter disregard of their true chemical composition. To distinguish Struve's Waters from all others, every bottle has a label and red ink stamp over the cork, each bearing Struve's name, without which name none is genuine, though contained in Struve's old bottles.

Williams and Son's Pure Glycerine

SOAP. Analysed by Dr. Hofmann, F.R.S., and Professor Redwood, Ph.D., strongly recommended by many eminent members of the Medical Profession, and favourably noticed by the following Medical Journals:—

THE LANCET.
THE MEDICAL TIMES AND GAZETTE.
THE BRITISH MEDICAL JOURNAL.
THE MEDICAL CIRCULAR.
EDINBURGH MEDICAL JOURNAL.
THE DUBLIN HOSPITAL GAZETTE.

It is suited to all cases of delicate skin (whether arising from disease or otherwise), and is admirably adapted for nursery use. May be had of all respectable Chemists, Perfumers, etc.

SOAP-WORKS, CLERKENWELL, LONDON, E.C.

Great Saving in the Purchase of New

MEDICAL GLASS BOTTLES and PHIALS at the NORTH LONDON GLASS BOTTLE WORKS, ISAACS and SON (Proprietors).—London Warehouses, 24 and 25, Francis-st., Tottenham-court-road, W.C.

3 and 4 oz.	ditto	blue tinted 7s. 6d. do.
1/2 oz. Moulded Phials	of a very 4s. 6d. do.
1 oz. ditto	superior 5s. 6d. do.
1 1/2 oz. ditto	quality 6s. 0d. do.
2 oz. ditto	7s. 0d. do.

A remittance not required till the goods are received. Packages free. Delivered free within seven miles. Post-office Orders payable to "S. Isaacs and Son," at Tottenham-court-road. Bankers: Unity Bank.

Varicose Veins and Supporting Bands.

—SURGICAL ELASTIC STOCKINGS AND KNEE CAPS, pervious, light in texture, and inexpensive, yielding an efficient and unvarying support, without the trouble of lacing. Likewise, a strong low-priced article for Hospitals and the Working-Classes. ABDOMINAL SUPPORTING BANDS for both Sexes; those for Ladies' use, before and after accouchement, are admirably adapted for giving adequate support with extreme lightness—a point little attended to in the comparatively clumsy contrivances and fabrics hitherto employed. Instruction for measurement and prices on application, and the articles sent by post from the Manufacturers and Inventors, POPE and PLANTE, 4, Waterloo-place, Pall-mall, London, S.W.

The Profession, Trade, and Hospitals, supplied.

Microscopic Glass.—Thin Glass for

Mounting Objects, in squares or circles. Slides 3 in. by 1 in., and Cells of every kind, supplied Wholesale and Retail, by CLAUDET and HOUGHTON, 89, High Holborn, London.

MEDICAL AGENCY.

NOTICE OF REMOVAL AND CHANGE OF FIRM.

Mr. Lara (for the last eight years the sole representative of LANE and LARA, Medical Agents and Arbitrators and Lunatic Asylum Registrars,) begs to inform the Profession that, in consequence of the daily increasing support with which he has been favoured, and for which he tenders his sincerest thanks and acknowledgments, he has taken into PARTNERSHIP Mr. James Maxfield Walters, a gentleman who has had considerable experience in the business. It will, therefore, from and after Christmas, 1858, be carried on, under the Firm of LARA and WALTERS, at 6, PUMP-COURT, Middle Temple, E.C., whither they have removed their Offices from 22, Buckingham-street, Adelphi, in order to provide that larger accommodation which a constant intercourse with a great majority of the entire body of General Practitioners in England has rendered necessary.

Partnerships and Practices sold and valued: Asylums transferred: Arbitrations effected: Assistants provided (if for a permanence without charge to Employers): and every other description of business transacted for the Profession at a fixed and moderate cost. Attendance from 11 till 4.

Evening Classes. — King's College,

London.—A MEETING will be held at King's College, on Friday, the 21st inst., at Eight p.m. for the purpose of giving information with respect to the work of the ensuing Winter Session. All actual Students and gentlemen proposing to join these Classes, as well as those who take an interest in the movement, will be admitted on presenting their card to the attendant at the door.

R. W. JELF, D.D., Principal.

King's College, London.—

EVENING CLASSES, 1859-60.

The following Classes will be opened on Monday, October 24:—
 Divinity—Rev. Professor Plumtre, M.A.
 Latin—Rev. C. U. Dasent, M.A.; Rev. A. J. M'Caul, B.A.; and J. Lamb, Esq.
 Greek—Rev. A. J. M'Caul, B.A.; J. Lamb, Esq.; and J. Swift, Esq.
 French—Professor Mariette, Messrs. Stievenard, and Thibaudin.
 German—Rev. Dr. Wintzer.
 Italian—Professor Pistrucci.
 English Language, &c.—Henry Morley, Esq., A.K.C.

 Arithmetic and Bookkeeping—James Haddon, Esq., M.A.
 Principles of Commerce—Professor Leoni Levi.
 Drawing—Professor De La Motte.
 The Elements of Chemistry—Professor C. L. Bloxam.
 Natural Philosophy and Optics—Professor Goodeve, M.A.
 For a prospectus giving full information, apply to J. W. Cunningham, Esq., King's College, London.

Royal College of Surgeons of

ENGLAND.—Notice is hereby given that the Professional Examination for the Fellowship of this College will be held on Tuesday and Thursday, the 15th and 17th of November next.

That the Primary or Anatomical Examination for the Diploma of Member of this College, will be held on Tuesday, the 22nd of November next, and following days.

And that the Surgical or Pass Examination for the Diploma of Member will be held on Tuesday, the 29th November next, and following days.

Particulars relating to these Examinations may be obtained on application at the College.

October 10, 1859.

EDMUND BELFOUR, Secretary.

Hospital for Sick Children, 49, Great

ORMOND-STREET.—A SERIES of LECTURES on the DISEASES OF CHILDREN will be given every SATURDAY during the months of NOVEMBER, DECEMBER, and JANUARY, by Dr. WEST, Dr. JENNER, and Mr. ATHOL JOHNSON, the Physicians and Surgeon of the Hospital. The First Lecture will be given on SATURDAY, NOVEMBER 12, at 3 p.m., by Dr. WEST.

The Lectures are open to Practitioners of Medicine, and to Students after their first year, on written application, addressed to the Secretary at the Hospital.

By order of the Committee of Management,

H. A. BATHURST, Hon. Secretary.

Evening Demonstrations of Anatomy.

—Mr. CHRISTOPHER HEATH, Demonstrator of Anatomy at the Westminster Hospital, will resume his Evening Course of DEMONSTRATIONS and EXAMINATIONS upon the DISSECTED SUBJECT on Wednesday, the 5th of October. The Demonstrations take place on Monday, Wednesday, and Friday evenings, during the Winter Session, from Seven to Nine o'clock, at the Westminster Hospital. Entrance Fee (perpetual) Five Guineas.

Anatomy. — Dr. John Struthers,

F.R.C.S. will RESUME his COURSES of ANATOMY at SURGEONS' HALL, on November 3rd. Lectures: Systematic Anatomy at Two o'clock. Demonstrations: Regional Anatomy, at Four o'clock. Practical Anatomy; Dissections, with Superintendence and Instruction, from Nine a.m. till Four p.m. These Courses qualify for the Royal Colleges of Physicians and Surgeons, University of Edinburgh, and the other Public Boards.

Edinburgh, October, 1859.

Wanted.—A Qualified Visiting and

DISPENSING ASSISTANT, to reside out of the house. Salary £75 per annum, with apartments. Address, Alpha, Mr. Bailey's, Wellington, Durham.

Medical Transfer and Partnership.

30, Bucklersbury, Cheapside.

Mr. Orridge, Medical Transfer Agent,

Referee, and Valuer of Medical Property, may be consulted, at the above Address, by Gentlemen about to receive PARTNERS, or to RELINQUISH or to COMMENCE Practice.

Mr. Orridge is known to many of the Hospital Physicians and Surgeons of London.

He has been concerned professionally for a considerable proportion of the most influential Practitioners (including Partners in many of the leading Medical Firms), to whom he has the satisfaction of being permitted to refer—a privilege that he trusts will be regarded as a proof of the sincerity of his endeavours to conduct these transactions in an honourable and straightforward manner.

Gentlemen desirous of obtaining Mr. Orridge's opinion, or requiring his attendance professionally in any part of England, can obtain terms on application, by (confidentially) transmitting name and address.

Office Hours, from Eleven to Four.

Urine.—Dr. Harley will commence

his COURSE of EIGHT LECTURES, for Medical Practitioners, on the PHYSIOLOGY and PATHOLOGY of the URINE and URINARY DEPOSITS, on SATURDAY, October 29, at 10 a.m. Fee £2. The Lectures will be delivered fortnightly. Gentlemen proposing to attend will please send in their names as early as possible.

Physiological Laboratory, University College, London.

The Queen's Hospital, Birmingham.—

A VACANCY has occurred in the Office of RESIDENT MEDICAL OFFICER. He is provided with Board, Lodging, and Washing, and receives a Salary of £75 per annum, with an annual increase of £5 the first year, and £10 the second and third year, to £100. The Candidates, who must be Members of the Royal College of Surgeons, and Licentiates of the Apothecaries' Company, are requested to send in their testimonials of qualification to the Secretary, on or before the first of November next. The Candidates whose qualifications are not approved will be informed thereof immediately after the 7th of November, whilst those from whom the Committee of Council wish to make the selection will be invited to attend a meeting for that purpose, at their own expense, of which information will be sent to them. The Surgeon elected will be required to enter on the office on the 1st of December next, and to engage for three years.

DAVID MALINS, Jun., Secretary.

Stockport Infirmary.—Wanted, an

ASSISTANT HOUSE-SURGEON and APOTHECARY. He must be a Member of one of the Royal Colleges of Surgeons, and a Licentiate of the Apothecaries' Hall. His duties will be to visit home patients and assist in the duties of the house. Engagement for two years, at a salary of £50 per annum, with Board and Apartments in the Infirmary. Testimonials to be sent prepaid to Mr. S. W. Wilkinson, Hon. Sec., at the Infirmary on or before the 28th of October. The appointment will be made on the 7th of November, 1859.

By Order of the Committee, S. W. WILKINSON, Hon. Sec.

Stockport Infirmary, October, 1859.

Wanted, by a General Practitioner,

a Licentiate of the Society of Apothecaries, &c., a SITUATION in Town or Country; who has for some time been accustomed to the routine of General Practice. Address, B. C. L., Lawton, near Newcastle-under-Lyne, Staffordshire.

To Surgeons.—To be Disposed of

IMMEDIATELY, a SURGEON'S BUSINESS, newly-established, averaging at the rate of £200 per annum. Rent of House, with nine rooms, exclusive of taxes, £18. It is opposite to an Hospital, where vacancies are frequently occurring for Surgeons. The town contains 16,000 inhabitants, and is not overcrowded with Surgeons. An Introduction given. No Good-will required; and Drugs and Furniture to be taken at a Valuation. Apply to Mr. A., care of Mrs. Matthews, 2, King-street, Bath-street, St. Luke's, Middlesex.

Assistant's Situation. — A M.R.C.S.

Edin., having recently had the care of several rural districts as Medical Officer, is anxious to obtain a similar appointment under a Medical Gentleman, as an In-door or Out-door ASSISTANT. The Advertiser is of the middle age, and of steady habits. Excellent references will be given. Apply to A., care of Thomas Chandler, Esq., Surgeon, Sun-street, E.C., London.

Dispensing Assistant required by a

Surgeon in the Country. He must be qualified to attend Midwifery and visit occasionally. Applications, with reference, and stating the amount of salary required, to be made to Thomas Chapman, jun. Esq., Ampthill, Bedfordshire.

To Students and others.—You will do

well to inspect the NEW STOCK of Messrs. MILLIKIN and LAWLEY, 161, Strand, adjoining King's College, where the best and most modern INSTRUMENTS may be had at very reasonable charges. Trusses, Crutches, Splints, Legs, and all kinds of Surgical Appliances, made to order with precision and despatch.

London: Printed by CHARLES REED and BENJAMIN PARDON of 1, 2, and 3, Lovell's-court, Paternoster-row, in the City of London, and published by JOHN CHURCHILL, at the Publishing Office, No. 11, New Burlington-street, in the Parish of St. James, in the City of Westminster.—October 22, 1859.

A Manual of Dental Surgery.

With 208 Engravings on Wood, fcap. 8vo, cloth, 12s. 6d.

Illustrated with numerous Engravings on Wood.

By JOHN TOMES, F.R.S.

"This book has the advantage of being all that could be desired in a manual of the art, ably filling a void long felt in general surgical literature, and well calculated to uphold Dental Surgery in the high position to which it has attained as a scientific branch of the healing art. To the library of country Practitioners especially it will be an invaluable addition. Liable as they are to be more frequently appealed to in cases of dental pathology than their brethren in the large cities, where specialists abound, they will do well to fortify themselves by acquiring the extended acquaintance with the subject this work will afford them."—Dublin Medical Quarterly.

with a Method of Investigating and Reporting Surgical Cases. By FURNEAUX JORDAN, Assistant-Surgeon to Queen's Hospital, Professor of Anatomy at Queen's College, Birmingham.

"Mr. Jordan's work is one likely to prove of great practical utility, and we cordially recommend it to the notice of our Profession."—Medical Times and Gazette.

"The publication of this work is very opportune for students now about to commence in our schools the study of Surgery. To them we earnestly recommend it as supplying, in a compact form, all that they require which any book can give for the purpose of becoming competent to analyse, duly value, and correctly register the phenomena of surgical affections, to the literature of which it is a highly interesting addition."—Dublin Quarterly Journal of Medical Science.

"The symptoms and phenomena of surgical diseases and injuries are carefully arranged."—Brit. and For. Med.-Chir. Review.

"It is written with great care and clearness, and will, without doubt, do its share—not a trifling one—of work in fitting the surgical student for the efficient practice of his art."—British Medical Journal.

Scammony Manufactured from the

ROOT.—This Pure Resin may be had of all Wholesale Druggists at 25 per cent. under the price of the best Virgin Scammony.

And the superiority of its quality was fully explained at a meeting of the Pharmaceutical Society, and reported at length in their Journal of March last, from which the following are extracts:—

"From these numerous observations, one hundred and twenty in number, together with many others which have not been tabulated, I am quite convinced that the scammony prepared by the new process from the untapped root is quite equal, as a remedy, to the very best virgin scammony which is met with in commerce, and equal, in fact, to the resin which is extracted from commercial scammony by means of ether; and it possesses this most important advantage over the scammony of commerce, namely, of being entirely free from the frauds which are almost constantly practised upon it in the country where the plant grows, and in which it has hitherto been collected, and, therefore, being perfectly uniform in its physical characters, composition and therapeutic action. There can, therefore, be no objection, but, on the other hand, manifest advantage, in employing it in place of the scammony commonly met with."

"A. B. GARROD, M.D., F.R.S., F.R.C.P.

"Professor of Materia Medica, Therapeutics and Clinical Medicine at University College; Physician to University College Hospital."

"I have endeavoured to ascertain the relative activity of Messrs. M'Andrew's scammony, and of a fine specimen of commercial virgin scammony, by prescribing these drugs alternately in equal doses to the same patient. The results, according to the judgment of myself and others who have assisted me in watching the cases, is that in most instances Messrs. M'Andrew's scammony has proved itself decidedly more active than the virgin scammony. As to pleasantness of operation, or the reverse, there seemed to be no choice between the two specimens."

"That a preparation of scammony should be a little more or a little less active is of comparatively small importance. It is far more important that the drug should have a fixed and uniform composition and activity, so that the prescriber may know, with an approach to certainty, what doses are required to produce a given effect. This advantage of uniform activity Messrs. M'Andrew's scammony seems likely to possess over the scammony which has hitherto been in common use, and which is a drug notoriously of most uncertain composition and power."

"GEORGE JOHNSON, M.D., F.R.C.P.

"Professor of Materia Medica and Therapeutics in King's College; Physician to King's College Hospital."

NEPENTHE, OR ANODYNE TINCTURE

(OBTAINED EXCLUSIVELY FROM OPIUM),

PREPARED AT THE LABORATORY OF FERRIS, TOWNSEND, LAMOTTE, & BOORNE,
MANUFACTURING CHEMISTS AND WHOLESALE DRUGGISTS, BRISTOL.

This preparation has now been for many years extensively used by a large number of eminent members of the Medical Profession with the greatest success. It does not produce headache, stupor, giddiness, prostration of strength, constipation, or the usual unpleasant symptoms attending the use of other preparations of opium.

Nepenthe has frequently been found of essential service in cases of Cancer, where every other opiate has failed.

The following Testimonials received from Medical gentlemen in extensive practice will be regarded as satisfactory proof of its efficacy:—

MEDICAL TESTIMONIALS.

"Having prescribed your 'Anodyne Tincture' in many cases, I would strongly recommend its more general adoption. It is especially useful in the wakefulness common after parturition, or other unusual exertion or excitement. It produces a refreshing sleep, and I do not remember any case in which it has caused the objectionable effects of the other opiate preparations.

"8, Wellington-street, London-bridge, August 14, 1856.

"SAML. GRIFFITH, M.D. London, M.R.C.P.

Consulting Physician-Accoucheur to the Farringdon Dispensary,

Physician-Accoucheur to St. Thomas's Hospital, &c."

"Gentlemen,—I have great satisfaction in bearing testimony to the value of your 'Nepenthe,' in relieving suffering from disease, and in procuring sleep, where ordinary narcotics fail or disagree. For several months I have found it very effectual in relieving a great sufferer when all the ordinary anodynes had ceased to benefit, and although the dose has not been increased for months, the relief is as complete.

"Nepenthe' is a very valuable addition to our means of relief, and the Profession and the public are greatly your debtors for it.

"I am, Gentlemen, yours obediently,

"EDWD. BECK, M.D. Cantab.

Physician to the East Suffolk and Ipswich Hospital."

"Portland-place, Reading, Nov. 21, 1856.

"To Messrs. Ferris & Co.
"Gentlemen,—'Nepenthe' has, for some time, been a favourite narcotic with me, and I infinitely prefer it to any preparation of opium now extant. It has proved a remedy of great value in all cases of Neuralgia, Chronic Rheumatism, Hypochondriacism, and indeed all affections where the use of a sedative is indicated; and in Delirium Tremens it is certainly invaluable, performing its operation upon the system, without leaving those distressing feelings consequent upon the use of opiates in general.

"I remain, Gentlemen, your obedient Servant,

"WILL. WOOD BRADSHAW, M.D. M.R.C.P. & F.R.C.S. Lond. &c. &c. &c."

Extract of a Letter from the late G. W. CAINES, Esq. M.R.C.S.

"Uffculme (Devon), Feb. 16, 1854.

"Please to send me some 'Nepenthe,' as I have a patient with cancer in the breast, with whom no other preparation of opium agrees. I have tried them all."

NEPENTHE may be procured direct from Messrs. FERRIS and CO., 4 and 5, Union-street, Bristol; from respectable Dispensing Chemists throughout the Kingdom; and from the following Agents:—

LONDON:—Mr. Thos. Keating, 79, St. Paul's-churchyard; Messrs. Evans, Lescher, and Evans, 60, Bartholemew-close; Messrs. Savory and Moore, 143, New Bond-street; Messrs. J. Bell and Co., 333, Oxford-st.
MANCHESTER:—Mr. James Woolley.
LIVERPOOL:—Messrs. Clay and Abraham; Messrs. Evans, Son, and Co.; Messrs. Clay, Dod, and Case.

BIRMINGHAM:—Messrs. Southall Bros. and Co.

YORK:—Messrs. Butterfield, Clarke and Co.

NORWICH:—Messrs. Smith and Sons.

PLYMOUTH:—Messrs. Balkwill and Co.

EXETER:—Mr. Geo. Cooper; Messrs. A. Evans and Co.

EDINBURGH:—Messrs. Raimes and Co.

As many imitations of Nepenthe have been attempted, the signature of FERRIS and COMPANY is placed over the cork of every bottle of the true preparation; and none purchased without this protection can be depended upon.

DR. DE JONGH'S

(Knight of the Order of Leopold of Belgium)

LIGHT-BROWN COD-LIVER OIL.

OPINION OF

EDWIN LANKESTER, Esq., M.D., LL.D., F.R.S.,

Late Lecturer on the Practice of Physic at St. George's Medical School, Superintendent of the Food Collection at the South Kensington Museum, &c. &c.

"I have much pleasure in bearing testimony to the excellent qualities of the Cod-liver Oil prepared under the superintendence of Dr. De JONGH, of the Hague.

"I believe that the purity and genuineness of this Oil are secured in its preparation by the personal attention of so good a Chemist and intelligent a Physician as Dr. De JONGH. He was the first Chemist who gave an accurate analysis of the Cod-liver Oil, and the discoverer of an organic substance which it contains.

He has also written the best Medical treatise on the Oil with which I am acquainted. Hence I should deem the Cod-liver Oil sold under his guarantee to be preferable to any other kind as regard genuineness and medicinal efficacy.—S. Savile-row, W., August 1st, 1859."

SOLE CONSIGNEES AND AGENTS,

ANSAR, HARFORD, & CO., 77, Strand, London, W.C.

WALTERS' INDIA-RUBBER URINALS.

F. WALTERS having originally invented these Urinals, begs to warn the Profession of the many bad and useless imitations which are now sold, and he would advise them, before purchasing, to look that they are stamped with his name; as, unless that be the case, he cannot guarantee them.

These conveniences are made for those who require them only occasionally, during a long journey, as well as for those invalids who use them always. MR. WALTERS has much improved them by making them of *Etherised India-Rubber*, which adds very greatly to the strength of the India-Rubber, at the same time that it prevents its sticking together; by this means he is enabled to make them less stiff and harsh than hitherto, and yet to retain all the advantages of that stiffness. There is a patent valve, which prevents the return of the fluid; and they may be worn either sitting, walking, or lying, without the slightest inconvenience, and without being perceived by any one.

WALTERS' CONVENIENCES FOR LADIES will be found particularly useful during pregnancy. They are perfectly soft and flexible, and may be worn with perfect comfort.

All Orders must be accompanied by a Post-office order or reference.—Entrance for Ladies at the private door, where a Female attends.

MANUFACTURER OF ELASTIC STOCKINGS, BELTS, &c.

16, MOORGATE STREET, NEAR THE BANK, LONDON. E.C.

No. 1, 2, 3, is J. Alderman's

Patent Graduating Elastic Couch, shown in different positions: it is fitted with two, three, or four distinct graduating actions, by which an Invalid can be graduated to any position, without being touched by the nurse, and free from all pressure, so that a patient cannot possibly become bedsores by long confinement.

No. 4, 4, is J. A.'s improved Spinal or general Invalid Couch and Carriage. The couch can be adjusted to any position, and has a shifting stand on easy castors for the room; so that the patient can be lifted with the couch from the stand to the

No. 8, 8, is J. A.'s Patent Portable Equilibrium Carrying Chair, which enables an Invalid to be carried up and down stairs with perfect ease and safety. The chair always adjusting itself, enables the two persons who

No. 9 is J. A.'s improved Four-wheel Albert Chair, fitted for hand or pony; the body being mounted upon C and under springs behind, and elliptic springs in front, which make it a most elegant and easy carriage.

No. 10 is J. A.'s improved Four-wheel Brighton Chair, mounted upon C and under springs both back and front, and has his new wrought-iron perches or cranes, instead of the old-fashioned wood perches. This is the most elegant and easy carriage in use.

No. 11, 11, is J. A.'s improved Three-wheel Albert Chair, with and without a head, which is as elegant and easy as can be made with three wheels.

No. 12 is J. A.'s improved Three-wheel Garden or Bath Chair, fitted with or without a head, and of the cheapest construction.

carriage without being touched, so as to go out for an airing when required.

No. 5, 5, is J. A.'s Patent Graduating, Elastic, Self-adjusting Chair, which, like the couch, is made to follow nature in every respect—the back, the arms, the seat, and leg rest being made to work all together, so that not a muscle of the patient need be disturbed. The arms are also made to put on and off, so that the patient can get on and off from either side while the leg-rest is up.

No. 6 is J. A.'s improved Exercising Horse.

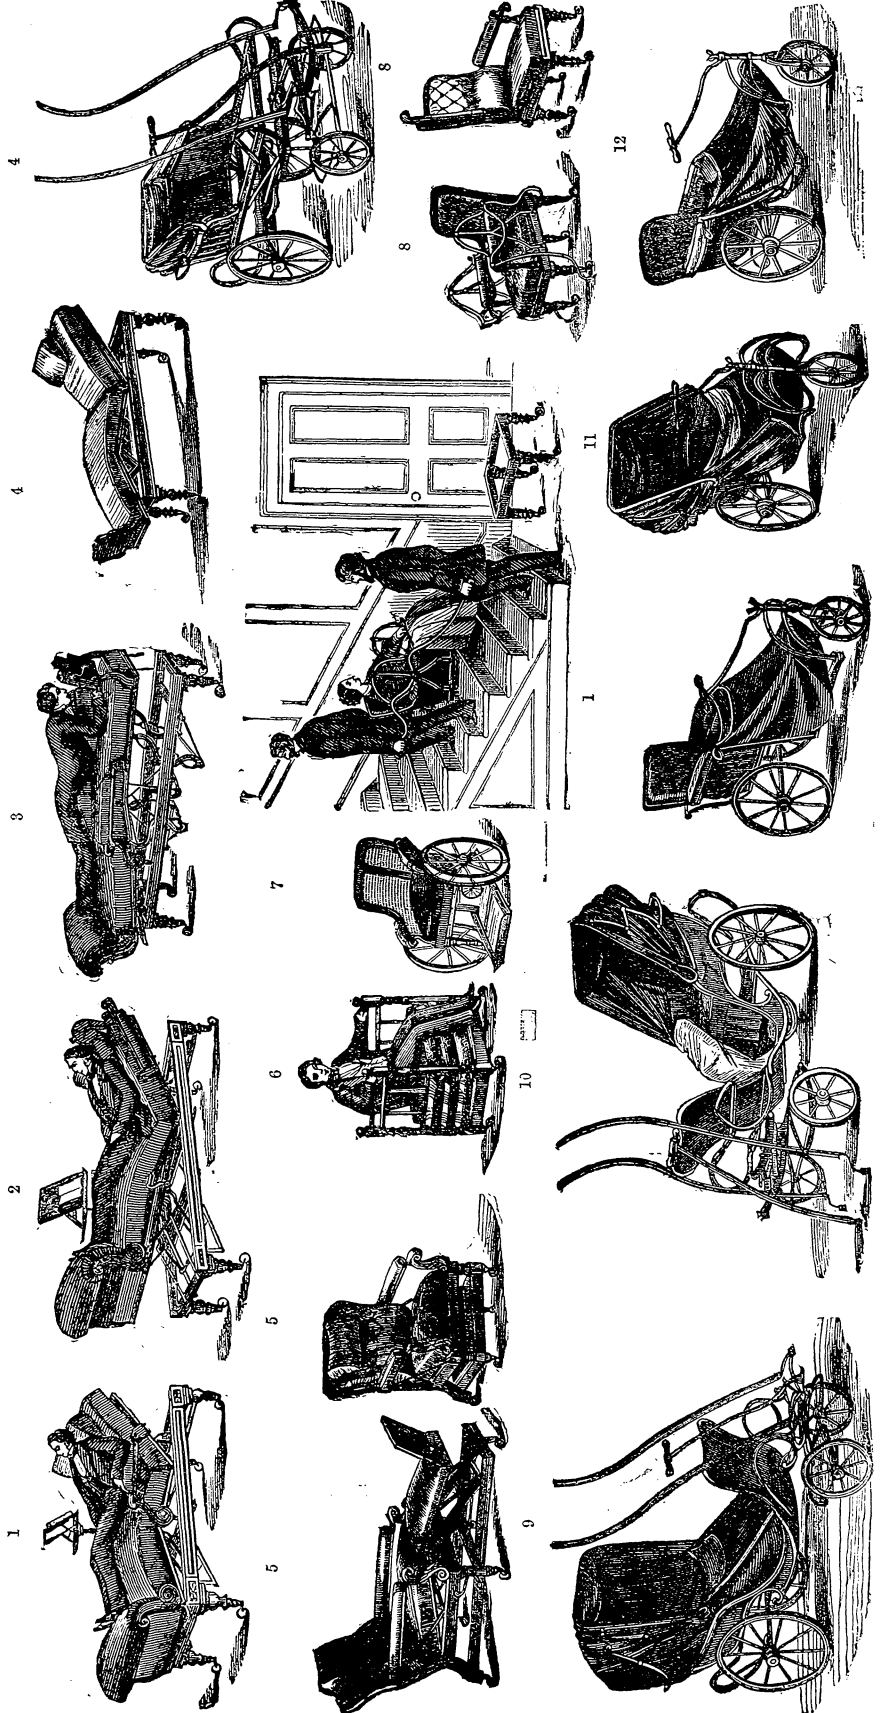

No. 7 is J. A.'s improved Self-propelling Chair, which renders an Invalid perfectly independent, being able to run from room to room without any assistance.

The chair always adjusting itself, enables the two persons who use it to walk up and down stairs in the usual way, quite erect, with their arms straight down, which avoids any strains upon their muscles. It is also an easy chair for the room when the handles are off, and free from oscillation.

No. 10 is J. A.'s improved Four-wheel Brighton Chair, mounted upon C and under springs both back and front, and has his new wrought-iron perches or cranes, instead of the old-fashioned wood perches. This is the most elegant and easy carriage in use.

No. 11, 11, is J. A.'s improved Three-wheel Albert Chair, with and without a head, which is as elegant and easy as can be made with three wheels.

No. 12 is J. A.'s improved Three-wheel Garden or Bath Chair, fitted with or without a head, and of the cheapest construction.

ORIGINAL LECTURES.

CLINICAL LECTURES

ON

THE DISEASES OF WOMEN.

By J. Y. SIMPSON, M.D. F.R.S.E.

Professor of Medicine and Midwifery in the University of Edinburgh.

LECTURE XXIII.

ON OVARIAN DROPSY.

GENTLEMEN,—During the course of the session we have had in the Hospital several cases of Ovarian Dropsy, one of which ended fatally, after a simple tapping, and was made the subject of a clinical lecture on Surgical fever. There is at present in the ward a patient who has been for several years the subject of this disease, and whom I tapped here, for the first time, about four years ago. A great quantity of fluid was withdrawn at that time from a large and prominent cyst, and the patient has remained in a state of comparative health till about a year ago, when the tumour again began to enlarge, and it has now attained such a size as to have become once more a cause of great inconvenience and distress. This enlargement has not taken place, I believe, in consequence of the cyst, which was formerly evacuated, having again refilled, for that in all probability became obliterated by the iodine injected after the former tapping; but, as was then ascertained, there were a large number of smaller secondary cysts also present, many of which seem now to have become distended with fluid and enlarged, so as to produce the present bulk of the tumour. Into the most prominent of these cysts I introduced, a few days ago, an ordinary trocar and canula, but, as those of you who were present had an opportunity of seeing, the fluid that escaped was only very trifling in quantity, and even after I had ruptured the septum between that cyst and a neighbouring one by means of a long probe passed through the canula, the quantity of fluid drawn off was still too small to lead to much appreciable difference in the size of the tumour, or to afford the patient any degree of permanent relief. She is, therefore, to be sent home, and advised to wait for a while, in the hope, that, after the lapse of a few months, the septa between the cysts shall have become thinned and broken down, and one large single cyst shall have been formed from the communication thus established between a multitude of smaller ones, when we may hope to obtain a better result from the operation of paracentesis. From this case, then, let me take occasion to tell you something regarding the nature and treatment of the disease, from which the patient suffers, and first of all as to

THE PATHOLOGY OF OVARIAN DROPSY.

The ovary, like all other organs of the body, is liable to various forms of disease, and to become the seat of different kinds of morbid growth. But the form of disease or degeneration to which it is above all others prone, is that commonly spoken of as dropsy of the ovary, consisting of a hypertrophy of the organ from the development in it of a number of large cysts or sacs filled with serous fluid. The ovary consists normally of an aggregation of many minute cysts—the Graafian vesicles, which are the essential elements of the organ, inasmuch as in them the ova are formed. These cysts are imbedded in a fibrous stroma, serving to support and separate the different sacs, and to permit of the ramifications of vessels and nerves in their exterior. Now it is a well-known and often exemplified law in general pathology, that when any organ becomes the seat of a new or morbid growth, this new or morbid growth most readily takes on a form of development leading to the formation of a tissue akin to the normal anatomical structure of the organ in which it has its seat. It is in accordance with this great law that the ovary is so pre-eminently prone to become the seat of cystic degenerations. But we meet with various forms of cystic degeneration or disease in the ovaries and their neighbourhood. Within the external margin of the broad ligament, where the peritoneal layers pass downwards and backwards from the fimbriated extremity of the Fallopian tube to meet

and invest the ovary, there lies a fibrous-looking, fan-shaped structure, imbedded in the folds of the peritoneum, and known as the organ or body of Rosenmüller—a body of but little importance in the adult, and rarely made a subject of anatomical or pathological observation. In the fœtus, however, it is relatively much larger than in the adult, and is an object of correspondingly greater importance. I have sometimes had occasion already to refer to some of the analogies between the different segments of the male and female organs of generation, and to point out the unity of structure that pervades the two sets of organs; and I may here state that the body of Rosenmüller is in all probability, as pointed out by Kobelt, who has named the organ in question the Pro-ovarium, the analogue in the female of the male epididymus. They each represent, at least in their respective sex, the remains of an organ of great size, and apparently of great importance in fœtal life—the Wolffian body. But what I want more particularly to say at present with regard to the pro-ovarium is this, that being the remains of an organ of tubular structure, the tubuli do not all become entirely obliterated and degenerated into mere fibrous cords, for some of them retain their original character till far on in adult life, and occasionally a secretion of serous fluid takes place into these cæca or tubes, distending and enlarging them, and so producing one of the forms of cystic degeneration so often met with in this locality. The form I allude to consists of cysts between the layers of the broad ligaments, or elongated pediculated cysts attached to the fimbriated extremity of the Fallopian tubes, or their neighbourhood. It is not, however, of this form of cystic disease that I am now to speak, nor of that form of dropsy, which depends on partial obliteration or occlusion of the Fallopian tube and its distension by the secretion of fluid into it between two obliterated points. We put these out of the category of cases of ovarian dropsy, seeing that they have not their seat in the ovary itself, but only in the organs nearest it, and pass on to the consideration of the various forms of cystic disease to which the ovary itself is liable.

1. *Unilocular Dropsy of the Ovary.*—The simplest form of ovarian dropsy is that where there is one single large cyst developed in one or other ovary, with very thin walls, and filled with a simple serous fluid. This is the form of the disease which we most desire to meet with in practice, for it is that which is most amenable to treatment, and in regard to which we may always most confidently hope for a favourable termination. Unfortunately, however, the unilocular ovarian dropsy is a very rare type of the malady; for far more frequently we find it presenting itself, as in the case of all the Hospital patients you have had occasion to see, in the form of

2. *Multilocular Dropsy of the Ovary.*—In this form of tumour we have not one single cyst, but a vast number of cysts of different sizes, usually, however, with one or two of these greatly predominating in size over the others. Multilocular ovarian tumours may be found of every possible size; and it is among this class that we find those rarer cases from time to time occurring in which the tumour is recorded to have attained to almost fabulous dimensions. At first, however, they are of small size, and the diminutive cysts of which they are made up are all pretty nearly of the same dimensions. The great subsequent bulk of the tumour is usually produced by the excessive development of a few of the peripheral sacs, one or two of which usually come to be much more distended and prominent than any of the others. It is a matter of very great practical importance to remark and remember, in regard to the growth of multilocular ovarian tumours, at what part of the mass it is that the greatest enlargement of the several cysts generally takes place. Fortunately for the prospects of successful treatment, the cyst or cysts which take on the greatest and most rapid growth are, as I have said, those which are placed towards the surface of the tumour, and at its upper and anterior surface. The largest cysts thus, as a general rule, fortunately come to lie, as development proceeds, high up in the abdominal cavity, and closely applied to the internal aspect of the anterior abdominal walls, through which they can most readily be reached by the trocar and canula, and thus most readily evacuated and obliterated. This development of the cysts in the superior and anterior aspect of the periphery of the tumour takes place in accordance with a general pathological law,—viz. That the extension of a morbid growth,—especially if it contains fluid,—goes on most actively in the direction where it meets with least

resistance to its increase from the normal anatomical structures of the body. The firm floor of the pelvis presents an

FIG. 1.

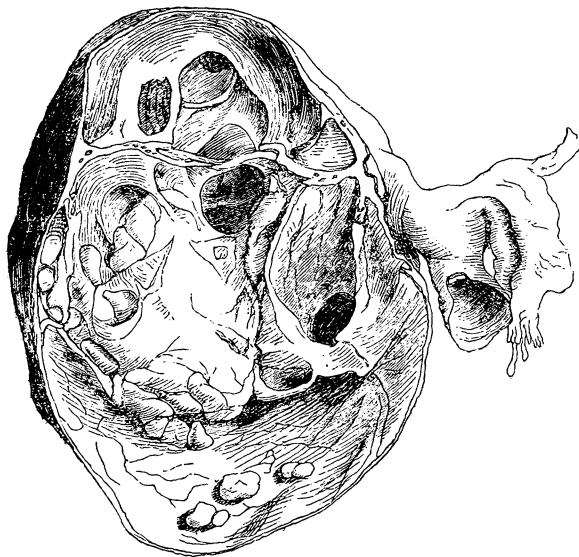

FIG. 1.—Section of a Multilocular Ovarian Cyst, showing secondary cysts on the walls of the largest primary cyst, and broken down dissepiments between others.

unyielding obstacle to the growth of the tumour in a downward direction, so that the cysts at the lower part of the tumour having no room to become enlarged and extended, remain, in general, comparatively small and undeveloped; while the cavity of the abdomen, filled only with the soft and mobile viscera, and closed only in front by the distensible abdominal muscular wall, affords free space for its enlargement upwards and forwards. In this direction, accordingly, the development of a dropsical or multilocular ovarian tumour chiefly occurs, and partly by the breaking down of the septa between cysts originally distinct, but more by the secretion into the cysts of a quantity of serous fluid, or gelatinous matter, the cystic mass often finally ends in the formation of a single large prominent cyst, or of two or three prominent and predominating cysts, which then become more accessible for tapping. Sometimes you will find a few cysts of smaller size lying higher up even than this large and prominent sac. For occasionally when cysts are at first divided by very thick dissepiments, these may resist the process of atrophy which occurs in the great majority of them, and leads to their destruction, and the fusion of contiguous cells; and then the cysts thus surrounded by a thick wall may remain even in the very summit of the tumour, projecting into the cavity of the large cyst, and appearing like a new tumour growing on the interior of its wall. But fortunately for the Practitioner, I again repeat, it is not the cysts which are situated lowest down in the pelvis that grow the quickest, and enlarge the most, but those which are situated above, and stretch up behind the thin abdominal parietes, through which they may readily be reached by the point of the trocar.

3. *Colloid Tumours of the Ovary.*—Though the form of tumour I have just been endeavouring to describe, made up of a multitude of cysts of different sizes filled with fluid or semifluid matter, is by far the most frequent in practice, yet there is another variety of cystic degeneration of the ovary that is by no means rare, and in which we have no cysts enlarging to any remarkable degree at the expense of the others, but the whole mass goes on enlarging more regularly, and the cysts are all more nearly equal in size, as may be seen from this drawing of the section of such a tumour. (See Fig. 2.) They are all rather small, separated by thin walls, and contain a gelatinous matter, which does not readily run out when the cyst is opened, so that the tumour maintains a semi-solid, semi-cystic character throughout, and does not collapse when cut across. This is the so-called colloid

tumour of the ovary, and you can easily understand, from what I have just said, how little hope we can have of benefiting

FIG. 2.

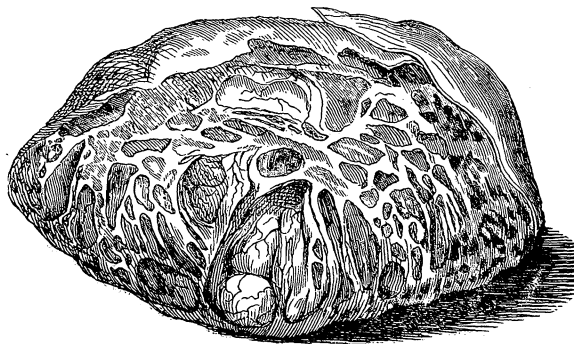

FIG. 2.—Section of a Colloid Tumour of the Ovary.

such a case by the operation of paracentesis. It is in this class of cases that we meet with most of the instances of unsuccessful attempts at tapping; and the only permanent surgical means is perhaps ovariectomy.

4. *Carcinomatous Tumour of the Ovary.*—Then we have a fourth form of ovarian tumour, which is fortunately rarer than most of the others, for it is the least amenable to treatment of any, and from its rapid growth it leads more rapidly to a fatal termination. The ovary is far from being a frequent seat of malignant disease, and when carcinoma does attack that organ, it usually assumes the form of encephaloma, with a number of cysts or cavities filled with a turbid fluid scattered throughout the mass. Sometimes the growth appears to be of this malignant character from the very commencement, but in other cases the malignant disease apparently supervenes at a late period in a tumour originally simple; a degenerative change taking place in the dissepiments of the tumour, which complicates the diagnosis, and compromises still more all the patient's chances of recovery.

5. *Steatoid Tumours of the Ovary.*—There is yet another form of cystic ovarian disease, which is still rarer than any of the others, and regarding which I am not at present going to enlarge. This form of tumour seldom attains any great degree of size, and in a patient who is the subject of it, you can feel a fluctuating cystic portion above, usually of about the size of a child's head, or a little more; and below, in the pelvis, there are some hard, unyielding nodules, which have all the firmness of a scirrhus mass. When the cyst is tapped, a yellowish creamy fluid runs out, which looks deceptively like pus; but after standing for a time it stiffens, and in part consolidates, and some of the matter that has first escaped may have begun to coagulate ere yet the cyst is fully evacuated. The escape of a few hairs through the canula may be the first object to excite a suspicion in your mind as to the real nature of the case; for if you could have an opportunity of opening such a tumour, you would find most likely a quantity of hairs in it, growing from a piece of true skin, which has become developed on the interior of the sac; and if there is a cross band in the cavity, you will probably find some teeth developed in it. Bones, resembling some of the various bones of the skeleton, are far more rarely found in them; and the cause of the production of all these highly-organised structures in the interior of a morbid growth forms an interesting but very difficult and debateable subject of pathological investigation, on the discussion of which I have no time now to enter. Let me rather pass on to the consideration of the ordinary course of a case of multilocular ovarian dropsy,—as the usual form of ovarian dropsy,—and the different modes in which the common type of the malady may terminate.

(To be continued.)

THE house of Théophraste Renaudot, the Physician, who about 1630, invented Journalism, the *Gazette de France*, "Monts-de-Piété," and "Bureaux of Information," etc., is on the point of being demolished, in order to make way for the continuation of the Boulevard de Sébastopol at Paris.

ORIGINAL COMMUNICATIONS.

ACCOUNT OF A CASE IN WHICH
THE INVERTED UTERUS WAS REPLACED
 AFTER A LAPSE OF NEARLY TWELVE MONTHS.

By CHARLES WEST, M.D.

Physician to the Hospital for Sick Children, and Physician-Accoucheur to St. Bartholomew's Hospital.

IN the Forty-first Volume of the *Medico-Chirurgical Transactions*, a case is recorded by Dr. Tyler Smith, in which that gentleman accomplished the replacement of a uterus after it had been inverted for twelve years. The means by which he effected this consisted in the introduction of an air pessary into the vagina, and the maintenance thereby of constant pressure against the fundus of the womb, while endeavours were made by daily manipulation of the organ with the hand to assist its reposition. In the second edition of my "Lectures on the Diseases of Women," at page 236, I have observed with reference to this case, that—"Further experience alone can show how far the principle here adopted, of steady continuous counter-pressure may prove successful; but the simplicity of the plan commends it; and we would hope that the result obtained by Dr. T. Smith may turn out to be, as I quite believe it to have been, more than a mere happy accident."

I have now the pleasure to report the particulars of a case which quite confirms these expectations; and at the same time to congratulate Dr. Tyler Smith on the happy ingenuity which devised a remedy so simple, so safe, so certain for an accident formidable in all cases, fatal in many; and for which the only modes of treatment previously known were either miserably inefficient or frightfully hazardous.

A. A., aged 25, applied at the out-patients' room of St. Bartholomew's Hospital, August 27, 1859, when she gave the following history of herself:—

She had been married five years, and had given birth to two children, of whom the former was born after a natural labour two years and a-half since; the second on October 16, 1858. The child in this instance also was born alive after an easy labour, but the placenta was retained for three and a-half hours, during which time very great hæmorrhage took place, and in consequence of it the patient became insensible, and was, therefore, unable to say whether it was eventually removed by hand, or expelled by the natural efforts. She was left by her labour in a state of such extreme weakness that she was quite unable to suckle her child; and suffered in addition from much pain in the abdomen and diarrhœa. These ailments confined her to bed; and at the end of five weeks phlegmasia dolens of the right leg came on, for which leeches were applied, and other treatment was adopted, until, at the expiration of seven weeks, she sought admission into the London Hospital, where she remained for a month, and left the Hospital much benefited as far as that ailment was concerned.

Soon after leaving the Hospital, and about three months after confinement, the menses first reappeared. From the first they were profuse, and intermingled with coagula; they lasted longer than natural, and returned more frequently, and for some time she had completely lost count as to when her periods were due, so frequent was their return, so almost constant their presence, while an abundant yellowish leucorrhœa appeared immediately on the cessation of the sanguineous discharge. The return of the hæmorrhage compelled her on each occasion to keep her bed; but in spite of this precaution she had been reduced by it to a state of the most extreme exhaustion, her skin was sallow, her pulse very feeble, and very frequent, and she had the aspect of a patient suffering from advanced malignant disease.

On making a vaginal examination, a tumour of an oval form was discovered hanging down for about two inches and a-half through the os uteri, which closely surrounded, but did not constrict it. Suspicion was raised as to its nature by finding that the pedicle of the tumour was of the same thickness as its extremity, and also by the fingers when passed up behind it encountering a *cul-de-sac*, as if the uterus, with the exception of its orifice, were inverted. Hæmorrhage

was not excited by the examination, but a rather abundant blood-stained purulent leucorrhœa. The patient was at once admitted into the Hospital, and on the 29th the diagnosis was established by the following means:—

1st. The uterine sound carried round the pedicle of the tumour encountered resistance to its further passage all round at the distance of half an inch. The finger, though introduced easily behind the tumour, could not be passed in front of it, as the anterior lip was too closely in contact with it.

2nd. The fingers introduced into the rectum could without much difficulty be carried above the fundus of the tumour, showing that the body felt per vaginam was not an outgrowth from the uterus, but the uterus itself in an altered position.

3rd. If while one hand was in the vagina the other was pressed firmly over the symphysis pubis; at first, no body was felt between the two hands. Pressure made against the tumour in the vagina, however, brought it before long within the grasp of the other hand, when it was possible, through the thin abdominal walls, not only to distinguish its contour, but even to perceive the circular depression in its upper part which indicated the point of inversion of the womb.

Dr. Tyler Smith's case suggested an imitation of his proceedings, and, accordingly, after efforts made with the hand by grasping and compressing the womb to restore its position, or at least to render it more yielding, an air-pessary was introduced into the vagina and inflated to as great an extent as the patient could bear. On the following morning the os uteri was found much more dilated, and its tissue much more yielding, so that the fingers could now be passed all round the tumour with ease, and everywhere discovered the inversion of the substance of the womb. Manipulation of the inverted uterus was repeated daily until the 5th of September, and the pessary was on each occasion reintroduced and reinflated, with the exception of one day, on which it was discontinued, in order to obtain relief for the bowels.

It did not seem, however, that much was gained by the proceedings beyond that increased dilatation of the os which was obtained by the first introduction of the pessary. The vaginal walls, indeed, were rendered more yielding by the extension to which they had been subjected by the pessary, so that the whole uterus admitted of being pushed up in the pelvis more readily than before, but no change was effected in the relation of the inverted body itself. A very offensive leucorrhœa had been excited by the pessary, and its distension had occasioned a very painful stretching of the vagina; but in spite of this the patient's health was already much better than at the time of her admission; she had already gained strength, and her complexion had lost something of its sickly hue.

I now attempted to modify the instrument, and had a pessary constructed so as to expand at its upper third more than elsewhere, in order to avoid needless stretching of the vagina; while it was fitted, by means of a wire stem, to a girdle which encircled the body in order to obtain a fixed point from which the pressure should act; a condition altogether absent in the air-pessary as at first employed.

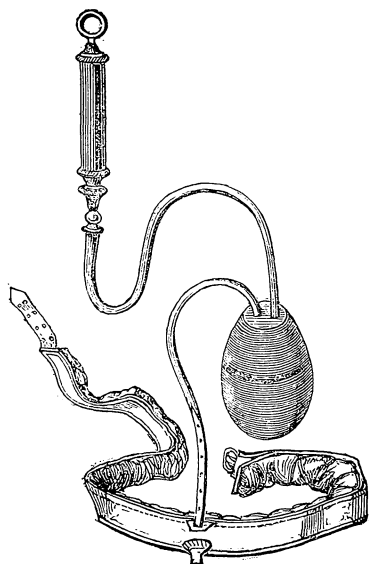

This was first tried on September 20th, the patient having remained since the 5th without any attempts at the replacement of the organ. Some advantage seemed to be gained by the pessary thus modified. It retained its position well, and seemed to produce less discomfort, and to cause a less profuse and less offensive discharge. Still it did not appear to exert any influence on the uterus itself, its force being rather expended in stretching the vagina.

After a few days' trial, I accordingly removed it, and had another constructed of smaller dimensions, under the impression that if it were introduced within the os uteri and there inflated it was more likely to expand the uterine walls, and thus to replace the organ than by any mere pressure exerted from below upwards against the fundus of the womb. On October 3rd this new apparatus was introduced for the first time, and though no effect was produced in the first twenty-four hours, it was reintroduced on the 4th, and allowed to remain for forty-eight hours in its position. On the 5th the patient complained of a good deal of pain in the abdomen, though not of more than she had experienced on some former occasions; and it was with a feeling of glad surprise that on the 6th it was discovered that the organ had resumed its natural position.

The os uteri was widely open so as readily to admit two

fingers, and its lips were much swollen, the uterine sound passed nearly three and a half inches, and the womb was now felt in its natural position by the hand placed over the pubes. The patient was kept quiet in bed, and for the next twenty-four hours, the urine was drawn off by the catheter. On the 7th the sound ascertained that the womb still retained its proper position. Menstruation came on on the evening of that day, and continued scantily until the 11th; and on the 13th the sound discovered the uterus to have somewhat contracted, and now to measure scarcely three inches; and on the 18th the patient left the Hospital apparently in perfect health, and having walked about for some days without inconvenience.

I append a drawing of the form of pessary which at last effected the replacement of the womb. The sole merit in such a case belongs to the person who first suggested the pro-

ceeding, and first by actual experiment proved its utility; but a few remarks on the best mode of employing it may be of service to those who hereafter may meet with a similar case.

1st. Neither in this case nor in another which came under my care, some ten years ago, did any benefit appear to result from manipulation of the womb, or from any attempts with the hand to replace the organ, or to reduce its bulk. The utility of such endeavours will, I apprehend, be limited to instances of recent inversion, or to those exceptional cases in which the womb remains comparatively yielding and flaccid some weeks after the occurrence of the accident, as it appears to have done in those reported by Dr. Belcombe (a), and Dr. Miller (b).

2nd. Many inconveniences attend the employment of the common air-pessary, partly from the want of some fixed support to retain it in its place, and partly from the circumstance that the pressure it exerts being equal in all directions; a most painful distention of the vagina is inseparable from any attempt to exert efficient counter-pressure against the inverted womb.

3rd. This disadvantage may be easily overcome by means of a belt to fasten round the waist, the anterior half of which made of steel, serves as a fixed point for a metallic wire, which is attached to a small wooden disk or cup that bears the pessary. The pessary itself, made of vulcanized india-rubber, and in this instance four inches long by five in circumference at its middle, was rendered comparatively inelastic at its lower half by the introduction of several layers of linen between the folds of the india-rubber, while no such material intervened to prevent the full expansion of its upper half when it was filled with air by means of the syringe through the elastic tube that was connected with it. By this means continued pressure was exercised against the fundus

of the inverted uterus, without painful distention of the vagina.

4th. I am uncertain as to the exact mode in which the replacement of the uterus is effected, and doubt whether it is due to the direct pressure of the pessary against the fundus of the uterus, so much as to the unfolding of the uterine wall by the instrument when introduced into the shallow *cul-de-sac* within the os uteri, formed by the still uninverted portion of the cervix. If this supposition be correct, one's endeavour in any future case would be, first, to introduce a small pessary within the os, in order to dilate the aperture, and to follow this up by the employment of one somewhat larger, with the view of thus unfolding the wall of the organ, rather than to force the fundus upwards by direct pressure against it.

A CASE OF MOVEABLE KIDNEY.

By GEORGE JOHNSON, M.D., F.R.C.P.

Physician to King's College Hospital, Professor of Materia Medica and Therapeutics in King's College, London.

THE subject of moveable kidneys has within the last few years been treated of by various authors. Rayer (a) gives the particulars of eight cases, and insists, with much reason, on the practical importance of a correct diagnosis. Oppolzer (b) has directed attention to the same subject. More recently, Dr. Hare (c), in a series of communications to this Journal, has treated the whole subject in a very able and lucid manner, and has given the particulars of six cases which have occurred in his own practice. Six cases have also been published by Hennoch (d) as having occurred within a comparatively short period in his practice. The following case affords, as I think, another illustration of the subject, and possesses in itself some points of peculiar interest.

During the present month of October I was asked to see Mrs. —, a lady about 34 years of age, of spare habit, who had never borne children. I learnt that for some years past she had been in a somewhat delicate state of health, and that on three or four occasions during the last twelve or fourteen years she had suffered severely from what she had been told was stone in the kidney. It was for an attack of this kind that my attendance and advice were now required.

No opportunity being afforded me of consulting with any previous Medical attendant, I had to unravel the history of the case as best I could by the help of the patient and her maid. From them I learnt that these so-called attacks of stone in the kidney had never been attended with vomiting or hæmaturia, and that no stone or gravel had ever appeared in the urine—facts sufficient to justify a doubt as to the existence of renal calculus. I further ascertained that the bowels were habitually costive, and on examination of the abdomen, the walls of which were quite flaccid, I distinctly felt a hard mass in the position, as I supposed, of the descending colon. I now concluded that the severe abdominal pains which had existed for some days past were the result of a feculent accumulation in the large bowel, and accordingly I directed the use of a copious enema of thin gruel. The result was the removal of a very numerous collection of scybala, with great relief from the pain. To my surprise and disappointment, however, I found that the tumour, though somewhat less prominent, was still palpable, and apparently unaltered in size. This might, perhaps, be due to some remaining scybala, but an enema introduced far into the bowel by means of the long tube, and this followed by a dose of castor-oil *per os*, brought away very little solid matter, and the tumour remained as before. Meanwhile, the patient's tongue, which had been thickly coated, was rapidly cleaning, and the pain was gone; I had satisfied myself that there was nothing abnormal in the character of the urine, and there was every sign of a speedy convalescence.

The tumour was now the only source of anxiety, and suggested fears of some malignant growth, or perhaps inflammatory thickening of the bowel, as a consequence of long-

continued irritation, produced by fæculent accumulation there. At length, after two or three careful examinations, I arrived at the conclusion that the tumour in question was neither more nor less than a moveable left kidney; and the following are the chief reasons for that diagnosis:—In size, form, and consistence, the tumour exactly corresponded with the kidney; the lowest point to which it could be made to descend was the umbilicus, from the left side of which it was freely moveable upwards, and it could readily be pushed beneath the ribs. When the fingers of the right hand were pushed into the patient's left flank, and those of the other hand placed in front, to the left of the umbilicus, the tumour could be easily and quickly pushed to and fro between them. This movement was effected without pain to the patient, who complained of some degree of tenderness only when the tumour was firmly compressed. She told me that she had often, when lying on her back, felt the tumour with her own hand, and that she has frequently experienced a sensation as of something solid moving within the abdomen, as well as a rather painful sense of dragging when standing or walking. I now had the satisfaction of assuring her that the tumour in question, although a source of some inconvenience, need occasion her no anxiety, and I suggested that besides having recourse to means for promoting a regular action of the bowels, she should wear an elastic abdominal belt as a support; but I have not yet had an opportunity of learning the result of this advice.

There seems no reason to suppose that the co-existence of the fæculent accumulation in the bowel with a moveable condition of the left kidney, was other than accidental. I have only to add that the right kidney, which in the majority of instances recorded has been the more moveable one, could not, in this case, be felt below its normal position.

11, Savile-row, W.

REPORT OF THE MEDICAL DIRECTOR-GENERAL OF THE RUSSIAN NAVY,

FOR THE PERIOD BETWEEN NOV. 1, 1857, AND OCT. 31, 1858.

Translated from the "*Morskoi Slornik*," a Russian Official Journal,

By JOHN MICHELL, Esq.

(Continued from page 402.)

CHIEF DISEASES.

ALTHOUGH no epidemics, in the strict sense of the word, were prevalent during the past year, attention has been directed in some localities to a considerable prevalence of catarrhal and rheumatic fevers, often in combination with local inflammations. Typhoid fevers arising from the two former classes of disease likewise occurred. Intermittent fevers continued to rage in some localities, especially in Archangel; in some places cholera again broke out, but without attaining a development to necessitate the adoption of any extraordinary precautionary measures.

Typhoid Fevers, as stated above, originated mostly from the typhoid character assumed by fevers of a catarrhal and rheumatic nature; and it was very rarely, and only in isolated cases, that they occurred in their typical form, the majority appearing in a slight development with typhoid symptoms of a mild form. The most ordinary symptoms which accompanied these fevers was a determination of blood to the head, attended with violent pain; affections of the bowels were rarely met with. In general these fevers were nowhere distinguished by the number of cases or any particular virulence.

The total number of cases of fever which assumed a typhoid character was 552; of this number 86 died.

Cholera, which continued to prevail the whole year at St. Petersburg, only broke out afresh at Cronstadt, and at the factories on the River Ijora. The cases of cholera at St. Petersburg were not numerous. In the Kalinkin Hospital in that city there were seventy-three cases of this complaint, of which forty were fatal. In the Naval Hospital of Cronstadt, the number of cases between June 4 (16), the day of its first appearance, and October 28 (November 9), the date of its disappearance, entered of all branches of the service was 283, of which 144 proved fatal; of the former,

138 cases occurred among seamen, 58 proving fatal. In females the fatal terminations were 22 out of 31 cases. The disease attained its greatest development at Cronstadt in the month of July, which was marked by the occurrence of 179 cases. Such a strong relative mortality from cholera as given above, proves the disease has not yet lost its intensity. Its malignity, however, as deduced from the foregoing figures, should not be regarded as absolute, there being obviously a lesser rate of relative mortality in the cases in which seamen were attacked, in comparison with those that occurred among men belonging to other services and occupations. Of the latter the greater number were free labourers, existing under very unfavourable hygienic conditions, and in most cases only recurring to Medical assistance after the disease had gone through its first stages. The following circumstance supports the argument:—In July, a considerable number of men belonging to the Sixth Equipage of the Fleet came into Hospital with cholera; the cause of these attacks was traced to their being obliged to use water of a brackish taste from alongside the ship while at anchor for four days in Cronstadt road; at the same time they were subjected to much extra labour, owing to the ship being hurriedly fitted out for sea. No sooner were these conditions removed, than the number of cholera cases considerably decreased. No man was attacked with cholera at the Ijora factories; women and children were subjected to the number of 102, the fatal terminations being 65. No other localities were marked by the appearance of cholera among the seamen of the navy, and by November 1 (13), 1858, cases of cholera had entirely ceased to be reported. Numerous facts have demonstrated that all epidemics, and cholera in particular, may be greatly arrested by a recourse to proper sanitary measures; the Medical department of the navy has again issued strict orders for punctual conformity to all prescribed sanitary regulations (a).

Total number of cases of cholera	492
Fatal cases	240

Intermittent Fever, indigenous mostly to the southern ports of the empire and to marshy localities, prevailed to a considerable extent in the Black Sea, especially at Sevastopol and Taganrog. In Astrakhan it exclusively formed the prevalent disease of the year; in other places it was rarely found, except at Riga, where its appearance was not infrequent. The phases of the disease were for the most part irregular. Malignant fevers (*intermittentes perniciosæ*) were rare, and the sequela, such as abdominal obstructions, dropsy, etc., were of more frequent occurrence than usual. Total number of cases of intermittent fever, 1218. No deaths.

Scurvy.—Particular attention has been directed to arrest the spread of this disease among the seamen of the navy, and the sanitary measures adopted, together with the absence of recruits, have conduced to reduce considerably the number of cases in comparison with former years. The Report for 1857 already showed a very great improvement under this head; but in comparison with 1857, the result of this year is as 1 to 2½. It is scarcely possible to expect to eradicate this disease entirely, however the condition of the seamen may be ameliorated; for it cannot fail to be produced under an unfavourable pressure of labour, under the influence of cold and unfavourable weather, and particularly during long voyages, which are necessarily accompanied by various moral and physical deprivations. Scurvy will also arise in the cases of young recruits, unaccustomed to the hardships of a seafaring life; and grief at leaving their homes has been known to develop scorbutic tendencies amongst them, without any other apparent cause. The highest ratio of scorbutic cases this year occurred at Archangel, where it was 1·19½. At other places it was as follows:—

Factories on the Ijora River	1·38½
Cronstadt	1·62½
Revel	1·88½
Astrakhan	1·92½
Nikolaef	1·97½

In other localities, scurvy was still less prevalent. The disease has only been found in a very light form, and, with the exception of a very few cases, has been easily amenable to

(a) It is remarkable that on the adoption of those measures, which consisted among others in allotting a separate part of the building to all cholera patients, and in more extensive use of chloride of lime for the disinfection of the evacuations of cholera sick, of their clothes, &c. &c., there has not for the last two years been a single case of cholera attacking other sick in Hospital.

treatment, particularly in summer. At Cronstadt, a remarkable case of a scorbutic affection of the heart and chief vessels occurred, attended with very considerable exudation of blood, etc., under the pectoral integuments, which required an incision for its removal, the patient subsequently regaining perfect health. Severe cases of scurvy occurred in some lighthouses, owing to communication with the land having been cut off for a considerable period; of these six terminated fatally. A village situated fourteen miles from one of these lighthouses was attacked by the disease, and carried off twenty men. Medical assistance having been sent to the spot in the middle of the month of June, forty-nine men were found to be suffering from it.

Total number of scorbutic cases 564
Deaths in lighthouses 6

Syphilis.—The sanitary measures recently adopted by the police for preventing the spread of this disease, have not yet been attended with the satisfactory results anticipated. Notwithstanding the reduction of the strength of the navy, the number of syphilitic cases exceeds that of last year by 8½ per cent. In inquiring into the probable cause of such a considerable increase, it naturally occurs that the cause is partly attributable to the insufficiency of the measures adopted, partly to the now ameliorated physical condition of the seamen, who being better fed and less worked, have necessarily more time and inclination for sensual indulgence. Amongst the other measures adopted, a Commission was appointed and opened in the month of April, 1858, for the examination of vagrant women, one of the chief sources of the infection. A visible diminution in the number of cases has been observed since the month of August under the operation of that Commission.

The ratio of syphilitic cases to the total number of men in health was as follows:—

Revel 1·8	Nikolaef 1·26
Taganrog .. 1·10½	Astrakhan .. 1·30
Sevastopol .. 1·14	St. Petersburg .. 1·36
Cronstadt .. 1·14	Ijora Factories .. 1·46
Archangel .. 1·19	Sveaborg 1·74

Total number of syphilitic cases .. 2291
Fatal 3

Ocular Diseases were less prevalent this year; a great number of cases, however, occurred at Nikolaef, Cronstadt, and St. Petersburg, owing to atmospheric influences, and in some cases to the nature of the work. The disease was almost entirely confined to the catarrhal affection of the conjunctiva: granulations occurred in some cases, and, at Nikolaef, formed the exclusive phase of the disease. Acute inflammation was seldom met with, and only in cachectic cases, or where affections of the eye had already existed. The treatment of ocular diseases has been very successful.

Total number of cases of ocular affections .. 1583

Natural Small-pox.—In the majority of the naval stations there were no cases of this complaint; in some places it occurred in a very sporadic form, and without anywhere attaining a malignant character.

Total number of cases of natural small-pox .. 18 cases.
Fatal termination 1 "
Vaccination has this year been performed in 3380 "
Successful in 3153 "

External Injuries occurred in the ports during the fitting out of vessels, and consisted chiefly in simple and compound fractures of the bones of the extremities; fractures of the clavicle being also not unfrequent. Dislocations were more rare. A considerable number of the cases of external injuries required important surgical operations.

Total number of cases of external injuries .. 697
Recovered by November 1, 1858 610
Fatal cases 13

(Signed) ROSELBERGER.

THE CHOLERA AT WICK.—The "John O'Groats Journal" states that since Wednesday week there have been six deaths, all of them occurring on the Wick side of the river. The deaths bear a large proportion to the number of people who have been ill. At present there are two serious cases of illness in Pulteney-town. The total number of deaths since the appearance of the disease is now 21, 18 of which have occurred in the town.

THE LONDON PRACTICE OF MEDICINE AND SURGERY.

ST. THOMAS'S HOSPITAL.

TRACHEOTOMY PERFORMED FOR SUBACUTE LARYNGITIS.—THE TUBE WORN FOR TWO YEARS AFTERWARDS.

(Under the care of Dr. PEACOCK.)

The following report contains further details of an interesting case which was recorded very briefly in our statistical summary. It is Case 14 in the table given this week:—

S. A. H., aged 26, a married woman, was admitted into Elizabeth's Ward, on July 16, 1857. She had then been suffering for a fortnight with cough and expectoration, and about a week before had begun to have a feeling of suffocation in the throat, and difficulty of breathing and of swallowing, but she had not had any medical advice. She stated that, in 1846 she had had inflammation of the kidneys, and in 1850 and 1853, attacks of inflammation of the chest.

When admitted into the Hospital she laboured under symptoms of subacute laryngitis; she breathed with great difficulty, and with a loud stridulous sound, and complained of pain in the region of the larynx, difficulty and pain in speaking and in swallowing. She spoke with a hoarse voice, and had a severe husky cough, but without material expectoration; she had also attacks of a suffocative character, which came on at frequent intervals. There was no appearance of recent or old ulceration in the fauces, and she denied having ever had any form of venereal disease. On the 17th, leeches were applied to the front of the throat, and a blister to the back of the neck, and small doses of calomel and Dover's powder, with the saline antimonial medicines, were given at intervals. On the 18th the leeches were repeated, and on the 19th a blister was applied to the front of the throat. Under these means she was greatly relieved; but having been exposed to the cold in leaving the ward, she was taken much worse, and on the 29th she was suffering from such urgent difficulty of breathing, that the trachea was directed to be opened should relief not be obtained, or should the symptoms become aggravated. The operation was performed at 4 a.m., on the 30th, by Mr. Williams, the House-Surgeon, and was attended by great relief to the dyspnoea. After four days she had improved so considerably that the tube was removed, and the wound was allowed to close. In two days, however, the symptoms again became so severe, that it was necessary to reintroduce the tube. On the 15th of August, she was directed to take the iodide of potassium in three-grain doses thrice daily, and the dose was gradually increased, till on the 14th of October she took nine grains three times daily. Under this treatment she very greatly improved; the difficulty of breathing subsided, and the secretion passed by the tube diminished greatly in quantity, and when the tube was closed she was capable of speaking in a full and tolerably clear voice. Whenever, however, the tube was removed, the difficulty of breathing returned and she was in the greatest dread of suffocation. The tubes were therefore gradually diminished in size, till she came to wear one of very small calibre, but still when the tube was removed the same difficulty occurred. The attempt to discontinue the use of the tube, therefore, was abandoned, and she was discharged from the Hospital in the month of March, 1858.

October 21, 1859.—Since her discharge from the Hospital she has worn the tube regularly; at present she seems in good health and has obviously gained flesh and strength. When the finger is placed on the mouth of the tube she speaks very distinctly, but her voice is still very slightly husky. She states that when the tube is removed to be cleansed she still suffers the difficulty of breathing and sense of suffocation. Ordinarily the tube only requires to be cleansed two or three times daily and sometimes once during the night, and it is removed once every week; but when she takes cold the secretion through the tube becomes much increased, and she has a troublesome cough and dyspnoea, sometimes difficulty also in swallowing. The secretion which passes by the tube is ordinarily only mucus, but it is occasionally bloody,

though the blood seems to be derived from the wound. She breathes freely, and has never any expectoration by the mouth. The chest is fairly developed and moves freely, and is apparently free from disease, but from the loud stridulous sound in the tube the respiratory murmur cannot be heard satisfactorily. The tube she wears is oval, and about 3-12ths of an inch in its largest diameter.

ST. BARTHOLOMEW'S HOSPITAL.

ANEURISM OF THE THORACIC AORTA—DEATH FROM RUPTURE—AUTOPSY.

For particulars of the following case we are indebted to Mr. R. Griffiths:—

J. G., aged 54, a muscular, well-developed man, temperate, and of healthy parentage, was admitted as an out-patient of St. Bartholomew's in the month of September last. He only attended a few times before his death, which occurred suddenly. His history was as follows:—With the exception of double inguinal hernia, of which he never complained, he had had "perfect" health until eighteen months prior to his decease. He had, however, been getting thinner for the last three years, having previously been corpulent. The first symptoms noticed referable to the disease which caused his death were first complained of in April, 1858, and were a constant, dull, aching pain under the sternum, which he attributed to "a cold," as he generally suffered more from the pain on such occasions. He suffered thus for two months, and then was free from pain, and apparently well until September, 1858, when he had pain on the right side of the chest about the nipple. It gradually increased, and remained until his death. It was described as often lancinating, and he would often assert that "there was something gathering there." He had, as attendant symptoms, giddiness and swimming in the head, coming on in slight attacks for about half-an-hour, during which he was compelled to sit down. Profuse perspiration of the head and face followed. The act of lying down was very difficult, from the increase of pain, but, when once recumbent, he was easy and slept well. The case was the same with rising in the morning. All these symptoms gradually increased, the giddiness becoming more frequent, and the unusual exertions difficult, especially sawing or planing, from the great increase of pain. He also mentioned a sensation "as if something was going to burst." He now sought advice at St. Bartholomew's Hospital, as a Physician's out-patient. The symptoms still increased, and especially the difficulty of assuming certain positions. When he wished to pick anything from the floor he studiously avoided bending the trunk, but flexed the knee and hip-joints. It is remarkable that during the whole of his illness he never complained of any difficulty in respiration, nor was any ever observed, either when lying or standing. On September 6, 1859, he died suddenly, while standing by his bench talking to his fellow-workmen. He expectorated once or twice a little mucus mixed with blood, sat down on a chair, saying, "I feel as if I were choking." Immediately a stream of blood came from his mouth and nose. He endeavoured to remove his neck-tie, but failed; he then fell forwards on the floor. Mr. Marsh, of St. John's-street, Clerkenwell, was sent for, and his assistant (in Mr. Marsh's absence) arrived shortly, and found him quite dead. His shirt was saturated with blood, which had also streamed on to the floor. There was about one pint in all.

Autopsy.—Two days after Death.—Present, Mr. Marsh and Mr. Griffiths. The chest and the abdominal cavity were laid open. On the left side the lung was quite healthy, but on the right it was firmly adherent opposite the lower part of the superior lobe. There was a large bulging of the mass of the pericardial, etc. contents to the right side, but no appearance of hæmorrhage. The step next taken was to open the trachea. It was filled with coagulated blood. The whole thoracic contents were now removed together. On careful examination, the pericardium was found adherent throughout, and required a considerable degree of force to strip it off, which, however, was accomplished, leaving the heart clean and smooth. Both ventricles were dilated. On laying open the aorta, the valves were found to be thickened, and the internal surface of the

aorta, as far as the commencement of the descending aorta, was roughened, injected, and marked by irregular patches, which seemed to be deposited between the coats of the vessel, as the internal coat was traversed by irregular fissures, and could be easily peeled off. At the commencement of the arch was a well-defined, circular, constricted orifice about the size of a half-crown, seeming as if a piece had been pushed out, the lining of the artery and that of the sac being continuous. The aneurism had obliterated the lower part of the superior lobe of the lung, and extended to the ribs, to the third of which, and also to the lung, it was firmly attached. This rib was so soft as to be broken by the least force. It was connected to the aorta by a kind of neck, which passed behind the superior vena-cava, and in front of the right bronchus, but apparently not pressing on these parts, as the distension was beyond. There was a considerable deposit of fibrin, which was in firm layers at the parietes, but soft, and indistinctly laminated in the centre. The rent in the wall of the aneurism was half-an-inch in length, and opened into the right bronchus. The head was not opened.

LIGATURE OF THE COMMON CAROTID ON ACCOUNT OF HÆMORRHAGE FOLLOWING THE PUNCTURE OF AN INFLAMED TONSIL.

(Under the care of Mr. STANLEY.)

On Wednesday last Mr. Stanley performed the operation of ligature of the common carotid under the following circumstances:—A delicate-looking man, aged 24, had been admitted on Monday night, with the history that on the previous Friday a Surgeon had made a puncture in his left tonsil, and that successive attacks of hæmorrhage had since occurred. It appeared that he had been subject to attacks of inflammation of the tonsil for some years. At the time of the incision the loss of blood had been considerable, but not so much as to prevent the man from walking to his home. He considered himself at the time to have been much relieved. All went on well up to Monday night, when the bleeding recurred. At the time of his admission he estimated his loss of blood at about a pint. The solid nitrate of silver was applied to the part with the effect of apparently arresting the bleeding for a time. Early in the morning, however, another hæmorrhage took place, and the nitrate of silver in solution was again resorted to. Between ten and two o'clock he had lost about a pint and a half of florid blood. At two o'clock (the time of Mr. Stanley's visit), a consultation was held, and it was decided to try the application of ice, and should the bleeding still continue, to apply a ligature to the common carotid. From this time until about two o'clock in the afternoon of Wednesday, the loss of blood was very trifling. About the last-named hour, however, a relapse occurred, and about half-a-pint of florid blood was lost. A consultation was again held, and Mr. Stanley decided at once to resort to the operation. The operation was performed in the usual manner, and quickly accomplished.

On the morning following the operation, we were glad to learn that the subject of the above case was doing well in every respect. No cerebral symptoms had occurred, nor had there been any return of the hæmorrhage. We shall, of course, revert to this interesting case at some future time, and acquaint our readers with its further progress.

TESTIMONIAL TO MR. WALTER, OF BROADSTAIRS.—At a meeting of the inhabitants, held at the Parochial School-rooms, Broadstairs, on Wednesday week, at which the Rev. C. F. Turrell, the incumbent, presided, a testimonial was presented to Mr. O. C. Walter, Surgeon, of that place, consisting of a handsome time-piece, and a box containing 500 guineas. On the pedestal of the time-piece was the following inscription:—"Presented, with 500 guineas, to Odiarne C. Walter, Esq., as a token of sincere respect, esteem, and gratitude, from rich and poor in Broadstairs and the neighbourhood, for his generous and unwearied services, during a period of twenty-five years. October, 1859."

MR. STEPHENSON, the Engineer, has bequeathed by his will a sum amounting to £25,000 to various public institutions, located chiefly in Newcastle-upon-Tyne, in the vicinity of which he was born, and with which so great a portion of his life was so closely identified. To the Newcastle Infirmary he has given £10,000.

THE LONDON AND PROVINCIAL
PRACTICE OF MEDICINE AND SURGERY.

COMMENTS ON THE SERIES OF TRACHEOTOMY
FOR FOREIGN BODIES.

THIS Group includes 13 cases, with 8 recoveries and 5 deaths. We may conveniently divide the series into two groups—one including those in which the foreign body was got away by means of the operation, and the other those in which it was not. Cases 1 and 2 may perhaps be fairly eliminated from the rest, since in both these the patient died during the operation. In one of these the foreign body consisted of a quantity of saw-dust, which had almost filled the trachea, and in the second it was doubtful whether death was not due to the use of chloroform, since the child was not in an urgent condition when the operation was commenced, and died suddenly before it was completed. These cases set aside, we have remaining 11, with 8 recoveries and 3 deaths. Of the fatal cases (Cases 1, 6, and 11), in none had the foreign body been got away, and in two of them it was found at the autopsy firmly impacted in the glottis. In the third the foreign body (the end of a crab's claw) occupied the trachea, between the wound and the larynx (a). We have now remaining for consideration the eight case, which recovered. Of these, six were boys, and two were girls, their average age was $5\frac{1}{2}$, their respective ages being, one 11, one 8, one 6, two 5, two 3, and one $2\frac{1}{2}$. Of these eight cases, in six the foreign body was got away at the time of the operation, and in the other two it was never found. In these latter it is of course possible that it had been coughed up and swallowed; in one of them the persistence of symptoms for several months indicated that it still remained in the larynx, and at the last note of the case the child was still unable to dispense with the tube. In the other case, in which the foreign body was not got away, the child recovered perfectly, and the wound healed. Of the six cases, in which the foreign body was either removed at the time or coughed through the wound a few hours afterwards, in all the recovery appears to have been easy and rapid. The fact that it was so, is very valuable, and an indication of the small amount of intrinsic danger which attaches to the operation of tracheotomy in children above the tenderest age. In only one or two of them is any mention made of bronchitis having occurred; and in those in which it did so the attack appears to have been slight, and easily subdued.

With regard to the operation itself in these cases, it is clear from the details which have been recorded, that the importance of making an unusually free opening into the trachea can scarcely be overrated. At Guy's Hospital a practice, which we believe originated with Mr. Hilton, prevails of cutting a valvular flap in the front of the trachea, and appears to possess great advantages. Several of the cases illustrate the importance of holding the lips of the wound widely open, and then endeavouring to excite a paroxysm of cough; while in none was any advantage gained by the use of forceps, etc., introduced in the hope of seizing the intruded body. The fact, that in two of the fatal cases the foreign body was found after death, still impacted in the larynx, while in a third, which recovered, its remaining there caused serious subsequent symptoms, indicate the great importance of careful explorations of the upper part of the air-tube at the time of the operation.

COMMENTS ON THE SERIES FOR LARYNGEAL
AFFECTIONS (EXCLUSIVE OF TRUE CROUP).

In this Series we have 37 cases, 17 of which resulted in recovery, and 20 in death. If we classify the whole of the cases with regard to the nature of the disease for which the operation was required, we shall find that in 18 the patients had suffered from *Syphilitic Laryngitis*. Of these 18, 8 recovered, and 10 died. In 3 of the 8 cases of recovery, and

(a) Several interesting cases of operation for foreign body in the larynx have been recorded in our pages during the last year, and are not included in the above report. In one, under the care of Mr. Cooper Foster, in Guy's, the foreign body (a bean) could not be got away, and at the autopsy was found impacted in one bronchus. In a second, under the care of Mr. Skey, in St. Bartholomew's, the foreign body (a plum-stone) was removed, and the child recovered well.

possibly in one or two others, respecting which our notes do not extend over a sufficient length of time, the patient was never able afterwards to dispense with the canula. Of the 19 non-syphilitic cases; in 7, the disease was acute laryngitis; in 2, it was inflammation of the pharynx and tonsils, probably complicated with œdema of the larynx; in 1, it was laryngitis occurring in the course of typhoid fever (b); in 6, it was chronic laryngitis; in 2, it was inflammatory œdema, complicating phthisis; and in 1, it was suppuration beneath the mucous membrane of the glottis. We will briefly consider each of these groups separately.

Acute Laryngitis.—In this Group we count Cases 2, 7, 9, 12, 25, 32, and 34, of which 3 recovered, and 4 died. Of the fatal cases, in the first (Case 7) death occurred suddenly in a fit of delirium, ten hours after the operation. The autopsy showed the epiglottis in a state of gangrene. In the second (Case 9), death occurred before the operation was completed. In this instance the symptoms of laryngitis had only been present a few hours. The autopsy showed œdema of the sub-mucous tissue of the glottis. In the third (Case 25) death occurred on the fourth day; but we have no particulars as to its cause, or respecting the post-mortem. In the fourth case (Case 32), an old man, the subject of albuminuria, died during the performance of tracheotomy for the relief of acute laryngitis. The patients in the three cases which resulted in recovery, were all able to dispense with the canula within ten days of the operation, and in all the wound subsequently healed well.

Inflammation of Pharynx, Tonsils, etc.—Of the two cases in which laryngotomy was necessitated by inflammation of the pharyngeal structures, one resulted in recovery and one in death. The fatal case was that of an old man (Case 4), in whom death occurred on the third day. The autopsy showed purulent œdema about the pharynx and glottis, and purulent infiltration of the lungs. The case which recovered was that of a girl in whom the right tonsil had become so much swollen that it occluded the pharynx. Deep punctures had been made, but no matter had been obtained. Laryngotomy was performed, but the canula was not introduced. The wound healed in about a week. Three weeks from the commencement of the symptoms the abscess in the tonsil gave way, and "about half-a-pint of greenish well-formed pus" was brought up.

Laryngitis Occurring in Typhoid Fever.—Our series presents only one instance (Case 5) which can be placed under this heading. Its particulars will be found at page 358 in this Journal for October 8. The man died twenty-seven hours after the operation.

Tracheotomy for Chronic Laryngitis.—This Group includes Cases 10, 17, 19, 23, 24, 30. In one of these (Case 24) the operation was performed twice within an interval of a month. We may thus count them as seven operations, and from six of these the patients recovered perfectly. The case which ended fatally was that of a delicate woman, in whom the disease had existed for six weeks, and in whose case reducing treatment had been employed. She did well for the first four days, but sank under profuse diarrhoea on the fifth. Extensive disease of the thoracic viscera was found at the autopsy. For further details see page 358 for October 8. Of the five cases which recovered, in two (if not in three) the patients were unable to dispense with the canula at the date of the last note. In one of them the laryngitis was probably connected with pulmonary mischief, as the patient subsequently died of phthisis, having, however, quite recovered as far as the operation was concerned.

Tracheotomy for Laryngitis Supervening during Phthisis.—In this Group we have two cases; in both the phthisis was advanced, in both the operation afforded great temporary relief, but both ended fatally within three days of its performance. (See Cases 20 and 22, page 359, October 8.)

Abscess Beneath the Mucous Membrane of the Glottis.—The subject of this case died on the third day after the performance of the operation. At the autopsy an abscess at the posterior part of the larynx was found which contained pus in which one of the arytenoid cartilages lay quite detached. (See Case 28, page 359.)

(b) See some interesting remarks on this complication of typhoid fever by Dr. Wilks, in the report of the last meeting of the Pathological Society.

TABULAR STATEMENT OF THIRTEEN CASES OF TRACHEOTOMY FOR FOREIGN BODIES IN THE WINDPIPE.

No.	Hospital and Surgeon.	Age and Sex.	Length of Time the Foreign Body had been in the Trachea before the Operation.	Operation, etc.	Result.	Nature of Foreign Body.	Remarks.
67 1	St. Mary's.—House-Surgeon.	4 —	Nearly moribund before operation.	Foreign body not removed.	Death on the fourth day.	A crab's claw.	At the autopsy the foreign body was found in the trachea just above the incision; mucous membrane of trachea was thickened; extensive pleuro-pneumonia.
68 2	" —	2 F	Twenty minutes; almost dead at time of operation.	Tracheotomy.	Death.	Saw-dust.	The trachea was found at the autopsy to be nearly filled with a plug of saw-dust at the bifurcation of the bronchi.
69 3	" Mr. Lane.	8 M	Six days; urgent symptoms only appeared on the sixth day.	Tracheotomy. Foreign body not removed.	Death before completion of the operation.	A piece of nut-shell.	The foreign body was found sticking in the crico-thyroid membrane, just above the wound.
70 4	St. Bartholomew's.—House-Surgeon.	5 M	Twenty-four hours; livid, insensible, and almost pulseless.	Tracheotomy. Foreign body ejected through the wound.	Recovery.	Plum-stone.	A slight attack of bronchitis followed, otherwise the recovery was good.
71 5	" Mr. Paget.	11 F	Fourteen days; symptoms decided but not urgent.	Tracheotomy in a few days, and again in fourteen days.	Recovered.	A mussel-plum.	The first operation (by Mr. Langdon, of Chobham,) relieved the symptoms for nearly a week.
72 6	Guy's.—	11 mths.	Four hours; suffocation imminent.	Tracheotomy. Much hæmorrhage. Foreign body not removed.	Died three hours after the operation.	A piece of bone.	At the autopsy a piece of bone was found firmly impacted in the rima glottidis.
73 7	" Mr. Cooper Foster.	5 M	Shortly before operation great dyspnoea on movement, lividity, etc.	Tracheotomy. Foreign body ejected from the wound.	Recovered.	A plum-stone.	Recovered without ill symptoms.
74 8	" Mr. Cooper Foster.	6 M	Five days; paroxysms of dyspnoea, with interval of apparent health.	Tracheotomy. Foreign body ejected from the wound.	Recovered.	A cherry-stone.	
75 9	" Mr. Hilton.	8 F	Two days; symptoms never very severe, but increasingly so.	Tracheotomy, by valvular flap. Foreign body ejected through the wound.	Recovered.	A large oval glass bead.	The wound was healed in three weeks.
76 10	King's College.—House-Surgeon.	3 M	A quarter of an hour; cold, pulseless, and nearly suffocated.	Tracheotomy. Foreign body never found, though repeatedly searched for.	Recovered. He had two severe attacks of bronchitis.	Small round shoe button, with thread attached.	The thread came away in a few weeks. Three months after the operation he was still obliged to use the tube.
77 11	The London.—House-Surgeon.	16 mths. M	About ten hours; exhausted and much depressed.	Tracheotomy. No foreign body was detected by examination.	The child was much relieved by the operation, but died ultimately, in about five hours after the operation.	Two pieces of fish-bone.	The foreign body was found firmly fixed between the vocal cords.
78 12	Addenbrooke's, Cambridge.—Dr. Humphry.	3 M	To all appearance dead at the time of the operation.	Tracheotomy. After being recovered by artificial respiration, the foreign body was expelled.	Recovered.	A hawk.	Left the Hospital in thirteen days.
79 13	Queen's, Birmingham.	2½ M	Fifteen minutes.	Tracheotomy. No foreign body to be found.	Recovered.	Said to have swallowed a plum-stone.	Liability to spasmodic cough; continued for a fortnight, and then gradually ceased.

TABULAR STATEMENT OF THIRTY-SEVEN CASES OF TRACHEOTOMY FOR LARYNGEAL AFFECTIONS.

No.	Hospital and Surgeon.	Sex	Age, etc.	State.	Treatment.	Nature of Obstruction.	Operation.	Immediate Result.	Further Result.	Remarks.
1	St. Bartholomew's.—Mr. Stanley	F	44	—	—	Syphilitic disease of larynx two years.	Tracheotomy	Recovered.	Left the Hospital in three weeks.	
2	" Mr. Stanley	M	32	Had ceased to breathe.	Free bleeding and leeching.	Edema of the glottis supervening on tonsillitis.	Laryngotomy	Signs of life were not manifested until ten minutes after the operation, by artificial respiration, and this was continued for some time longer.	He continued in a precarious state for a fortnight, but ultimately recovered.	It is worthy of remark that two minutes elapsed from the total cessation of respiration to the performance of the operation.
3	" Mr. Lloyd	M	Middle age	"All but asphyxiated."	—	Syphilitic disease of larynx.	Tracheotomy	Artificial respiration was used for two hours.	The relief to the respiration was perfect, but he died afterwards from exhaustion.	
4	" House-Surgeon	M	66	—	Punctures were made previous to the operation, with some relief.	Acute inflammation of tonsils and cedema of the pharynx.	Laryngotomy	—	Death three days after the operation.	Purulent infiltration round the glottis and in the lung was found at the post-mortem.
5	" House-Surgeon	M	A Boy	Extreme debility, with suffocative dyspnoea.	—	Laryngitis supervening in typhoid fever.	Tracheotomy	Relief was marked and immediate.	The difficulty of breathing returned, and he died in twenty-seven hours after the operation.	A slough in the mucous membrane of the larynx was found, the size of a fourpenny-piece.

TABULAR STATEMENT OF TRACHEOTOMY CASES—continued.

No.	Hospital and Surgeon.	Sex.	Age, etc.	State.	Treatment.	Nature of Obstruction.	Operation.	Immediate Result.	Further Result.	Remarks.
6	St. Bartholomew's.—House-Surgeon	F	A Prostitute	Suffocation seemed impending.	Mercurials and free depletion.	Acute (syphilitic?) laryngitis.	Tracheotomy	Immediate relief.	Breathing continued good, but at last note was stated not to be able to dispense with the canula.	
7	„ House-Surgeon	M	28 Sailor	Urgent dyspnoea.	Free bleeding gave temporary relief.	Laryngitis (idiopathic?).	Tracheotomy	Immediate relief.	Progressed most favourably for ten hours, and then expired in a state of delirium.	Post-mortem showed slough of the epiglottis, with serous effusion in the cellular tissue. Emphysema of the posterior mediastinum and compression of the lungs.
8	„ Mr. Paget	M	26	Paroxysms occurred occasionally. Operation was performed in an interval as a precautionary measure.	—	Syphilitic laryngitis.	Tracheotomy	Relieved for some days.	Died from broncho-pneumonia about the eleventh day.	No autopsy, but extensive tubercular disease of the lung was diagnosed.
9	„ Mr. Lloyd	M	55	—	—	Laryngitis.	Tracheotomy	Died before the completion of the operation. Artificial respiration was resorted to, but in vain.	—	At the autopsy great œdema of the sub-mucous tissue of the glottis was found.
10	„ House-Surgeon	F	53	—	Previous to admission she had been well leeches and blistered.	Chronic laryngitis.	Tracheotomy	Relieved.	Diarrhoea supervened on the operation, and death followed on the fourth day.	See Case 10, in <i>Medical Times and Gazette</i> , p. 358, for post-mortem appearances.
11	„ House-Surgeon	F	31	Dyspnoea.	—	Syphilitic ulceration of larynx and pharynx.	Tracheotomy	—	Inability to swallow followed the operation, and the patient died in seven days from exhaustion, having been fed with the stomach-pump in the interval.	
12	St. Thomas's.—House-Surgeon	F	17	Dyspnoea.	—	Acute laryngitis.	Tracheotomy	—	Recovered.	Tube removed on eighth day.
13	„ House-Surgeon	M	Adult	—	—	Syphilitic disease of larynx.	Tracheotomy	Immediate relief.	Recovered, but when last reported (three weeks after the operation) he could not dispense with the tube.	
14	„ House-Surgeon	F	26	—	—	Syphilitic (?) disease of larynx.	Tracheotomy	—	Recovered well, but could not dispense with tube.	The tracheal tube is still required up to the present: it is two years since the operation.
15	King's College.—Dr. Todd and Mr. Fergusson	M	40	There had been no loss of voice for months, but the dyspnoea had increased for the last three days.	—	Syphilitic ulceration of larynx.	Tracheotomy	—	Recovered.	
16	„ House-Surgeon	F	42	Suffocative dyspnoea in a relapse.	—	Syphilitic laryngitis.	Tracheotomy	Great relief.	Died from exhaustion on the fourth day.	Pulmonary congestion.
17	The Middlesex.—House-Surgeon.	F	30	Suffocation imminent.	—	Chronic laryngitis.	Tracheotomy	Great relief.	Recovered, but at last report was unable to dispense with canula.	
18	The Westminster.—Dr. Fincham	F	39	Very cachectic, respiration rapid, and swallowing difficult. The operation was performed when she was apparently <i>in articulo mortis</i> .	—	Syphilitic disease of the larynx, with ulceration of pharynx.	Tracheotomy. Much mucopurulent fluid escaped at this operation.	Quickly rallied.	Recovered. She left the Hospital well in all respects.	Tube coughed out six days after the operation.
19	St. George's.—Mr. Tatum	M	Middle age	He was subject to attacks of dyspnoea. The operation was performed as a precautionary measure.	—	Chronic disease of the larynx.	Laryngotomy	—	Recovered.	The breathing reported to be "more comfortable."
20	The London.—House-Surgeon	M	12	œdema glottidis occurred as a complication of phthisis	—	Inflammatory œdema of the glottis.	Tracheotomy	Immediate and great relief.	Death from exhaustion on the third day.	The autopsy showed extensive œdema of the glottis, pharynx, and soft palate, and tubercular disorganisation of the lungs.
21	„ House-Surgeon	M	40	"All but dead."	—	Extensive and syphilitic disease of larynx.	Tracheotomy Marshall Hall's "tracheotome" was used.	By artificial respiration he was completely rallied.	Death occurred from hæmorrhage into the trachea, caused by removal of the tracheotome.	He had been frequently admitted for syphilitic disease of the palate and pharynx.

TABULAR STATEMENT OF TRACHEOTOMY CASES—continued.

No.	Hospital and Surgeon.	Sex.	Age, etc.	State.	Treatment.	Nature of Obstruction.	Operation.	Immediate Result.	Further Result.	Remarks.
22	The London. — House-Surgeon	F	Adult	Death was threatened from laryngeal impediment.	—	Laryngitis with phthisis.	Tracheotomy. An enormous quantity of semi-purulent fluid was brought up through the canula.	Some relief.	Death followed thirty-six hours after the operation.	The autopsy revealed extensive disease of the lung. There was much inflammatory thickening of the mucous membrane of the larynx, and two small ulcers beneath the chordæ vocales.
23	St. Mary's — Mr. Lane	M	55	Dyspnoea.	—	Chronic laryngitis.	Laryngotomy by Mr. Lane.	—	Recovered well, but subsequently died of phthisis.	
24	„ Dr. Chambers House-Surgeon	—	—	Dyspnoea.	—	Chronic laryngitis.	Tracheotomy twice.	—	Recovered.	The second operation was performed a month after the first.
25	St. George's. — House-Surgeon	M	45	Dyspnoea.	—	Acute laryngitis.	Tracheotomy	Great relief.	Died on the fourth day after the operation.	
26	University College. — Mr. Erichsen.	M	32	Threatened suffocation	—	Chronic syphilitic laryngitis.	Tracheotomy	—	Recovered.	
27	Guy's Hospital. — House-Surgeon	F	26	—	—	Syphilitic ulceration of the larynx for two years.	Tracheotomy	Great relief.	Death from bronchitis in ten days.	The tube was retained throughout.
28	„ Mr. Callaway	M	30	The operation was performed under the most urgent circumstances of dyspnoea.	—	“Obstructive” (Syphilitic?) disease of larynx.	Tracheotomy by Mr. Callaway	—	Death from bronchitis on the third day.	The post-mortem examination showed extensive disease of the larynx, trachea, and bronchi. See Case 23, p. 359.
29	„ House - Surgeon	F	44	The operation was performed when the patient was apparently in articulo mortis.	—	Syphilitic.	Tracheotomy	Revived with difficulty, but did well.	Recovered.	
30	The Liverpool Royal Infirmary. House-Surgeon	M	33	Suffocative dyspnoea supervened on use of caustic.	—	Chronic laryngitis.	Tracheotomy	—	Recovered well, but unable to dispense with the canula when he left the Hospital.	
31	The Kent and Canterbury Hospital	F	17	Admitted for anæmia.	—	Swelling of the right tonsil.	Laryngotomy	Marked relief.	Recovered well.	The wound healed in a week, and, though the swelling decreased in size, it did not give way for three weeks. Then about half-a-pint of greenish well-formed pus was brought up.
32	„ „	M	66	The patient was suffering from albuminuria.	—	Laryngitis.	Laryngotomy	Death before the completion of the operation.	—	
33	The Derby. — Mr. Gisborne	F	22	Paroxysm of severe dyspnoea; cold and pulseless.	—	Syphilitic laryngitis.	Tracheotomy by the House-Surgeon	—	Died of bronchitis.	
34	Royal Berkshire Hospital, Reading. — Mr. Bulley	F	20	Sudden dyspnoea supervening on “sore-throat.”	—	Laryngitis with oedema.	Laryngotomy	Great relief.	Recovered. The wound did not heal for ten weeks.	The canula was worn for ten days.
35	Staffordshire General Hospital. — House-Surgeon	F	23	Paroxysms of dyspnoea.	—	Ulceration of the larynx, with warty growths (Syphilitic?)	Laryngotomy	Died before the completion of the operation.	—	A cluster of warts, with surrounding ulceration, were found in the trachea above the bifurcation of the bronchi.
36	Bristol General Hospital	F	25	Moribund.	—	Syphilitic ulceration of the larynx.	Tracheotomy	Died shortly after the operation, having never rallied.	—	A piece of carious bone was found at the autopsy in the laryngeal pouch.
37	The Dundee Infirmary	M	36	—	—	Syphilitic disease of larynx.	Tracheotomy	Temporary benefit.	Death took place in fourteen hours.	

NOTES AND QUERIES.

He that questioneth much shall learn much.—Bacon.

No. 374.—CAUSE OF THE PULSE.—DOCTORS DIFFER.

“For a long time there have existed among Physiologists and Physicians great differences of opinion concerning the cause of the pulse; and here, as in many other analogous cases, the disagreement has arisen in great part because each one maintained in an exclusive manner a portion only of the truth. Thus Galen and Harvey attributed the phenomenon solely to the *dilatation* of the arteries. Weithrecht and Bichat maintained that it depended essentially upon *displacement* of the artery; while Arthaud explained it by an effort of the

blood against the obstacle produced by the depression of the artery under the finger of the observer. Parry lastly saw in it only a *lengthening* of the artery. M. Flourens has shown that the phenomenon is made up of all the elements which can concur in the production of the beat of an artery—an opinion which was also that of Haller, and of Sæmmering. M. Marey has lastly experimentally demonstrated the part which is due to the depression of the vessel by the finger, and has explained in the clearest manner the mechanism of the movement.”—MILNE-EDWARDS.

No. 375.—AN ANCIENT DR. JEPHSON.

The Princess Anne had always been remarked for her devotion to the pleasures of the table; but as life advanced, her digestion weakened, and, very often, she suffered under the re-action of the stimulants she took to improve it; she then became low-spirited, and apprehensive regarding her

health. One evening she sent for the celebrated Dr. Radcliffe, at an inconvenient time, just as he had opened his second bottle of sack. He affected unbelief concerning the illness of the princess, and positively refused to prescribe any medicine for her, but bade her attendants put her to bed, declaring that she would be well in the morning. In a few days he was again summoned, at the same inconvenient time, but he refused to leave his bottle. "Pooh, pooh!" said he, "tell Her Royal Highness, nothing ails her but vapours, she needs neither physic nor Physician." The princess was, of course, very angry, and struck him off her list of Physicians, with which Dr. Radcliffe was much delighted; for, as he said, "he hated the Whig sovereigns so unfeignedly, that he should certainly have the credit of poisoning them; therefore he wanted none of their custom, not he." The hostility between the Princess Anne, and her Physician, had commenced as early as her flight from her father, in 1688; when the Bishop of London sent for him to come to Nottingham, to see after the health of the Princess, which showed some dangerous symptoms. Radcliffe indulged in much coarse vituperation on her conduct, and finished by assuring her messenger, "that he would not come." Radcliffe had been appointed Physician to the Princess Anne by the King her father, in 1686.

No. 376.—A PROBLEM.

SIR,—It has long been, as we are told, an admitted law in Physics, that the rigidity, dilatibility, and elasticity of the walls of tubes, exercise little or no influence over the quantity of fluid which flows through them. If this be true, in what way does the rigidity of the walls of arteries bring about hypertrophy of the heart, as it is said to do? I have examined several authorities on this point, and have not been able to obtain any satisfactory answer to the question; perhaps some of your readers can enlighten on this point a

PHYSIOLOGICAL STUDENT.

[Our correspondent has hit upon a very important point in physiology and pathology, which deserves more explanation from our teachers than it usually receives. What he says of the flow of fluids through tubes is correct, *provided the current is determined by a constant pressure*; but when the current is intermittent, as in the heart, it is found that the elasticity of the walls of the tubes augments the flow through the tube; or, in other words, rigidity of the great arteries lessens the quantity of blood which normally passes through them, and therefore is an obstacle to the circulation. The following is the explanation of the fact:—"The obstacle which opposes the flow of blood put in motion by the cardiac systole, results chiefly from the friction of this fluid against the walls of the vessels; and Physics teach us that the friction increases as the square of the rapidity of the current. Now the elasticity of the tube lessens the movement imparted to the blood by the ventricular systole, and continues the movement during the diastole. Consequently the displacement of a given quantity of liquid is effected in a period of time, about double that which would be required if the arteries were rigid tubes, and the speed of the current being reduced in like proportion, the resistance must be diminished as the squares of the numbers which represent the different speeds."]

No. 377.—AUTHORS' ANACHRONISMS.

Great literary men are apt to commit anachronisms. Perhaps you may think two modern slips of this kind, which I have not yet seen noticed by any one, worth recording among your "Notes and Queries." In "Nicholas Nickleby," Mr. Squeers orders his poor victim out into the garden to weed the walks, in the middle of winter, and when ever so many inches of snow lay on the ground. In "Adam Bede," we read that "Bartle gave a climax to his speech by lighting a match furiously against the hob." The "Great Unknown" makes him do this at a time at least one generation earlier than the days when such a wondrous invention as lighting matches by friction was thought of.—I am, &c. Sic.

No. 378.—MONTAIGNE—HIS DISEASE, AND THE DOCTORS.

"I am struggling," says Montaigne, "with the worst of all diseases, the most sudden, the most painful, the most deadly, and the most irremediable. Already I have suffered five or six long and painful attacks. Up to the age of 45 years I enjoyed good health. I would that of the many other presents which the liberality of age can bestow on a man,

some more acceptable one might have been given to me; this one, from my childhood, I have always held in horror. It must be supposed that I owe this calculus quality to my father, for he died at 74, grievously afflicted with a large stone in his bladder." He adds, however, that he is, of his brothers and sisters, the only one afflicted with the gravel, or, as he usually calls it, the colic. Then he goes on:—"The Doctors must pardon me, but, together with that same fatal infusion and insinuation, I received also a hatred and a despal of their doctrines. The antipathy which I have to their art is hereditary. Physic always turned the stomach of my ancestors; the very sight even of drugs was horrible to my father. It is probable that I had a prepossession of this kind; but I have always supported and strengthened it by discourses, which have established the opinions I now hold." Here follows a long tirade against Physic and Physicians. A rolling fire of epigrams, jokes, and anecdotes, picked up anyhow from the Ancients and the Moderns. The diatribes of Molière are kindnesses by the side of them. But the whole and true anger of Montaigne lay in this, that Medicine could not cure him. Nevertheless, he tried numerous remedies, for he thought health of no slight value—all philosopher as he was:—"Health," he said, "is a precious thing, and, in truth, the only thing, which is worth all the trouble men take in its pursuit—not only sweat, and pain, and money, but even life itself. Without health, life is painful and injurious, and pleasure, wisdom, science, and virtue, are all tarnished and disappear." "It is not, therefore, through anger or vain-glory," that he refuses to try new methods of cure. It is because it is repugnant to him to admit that a medicine directed towards a suffering organ can take itself surely to its right address. "The promises of Physicians," he says, "are incredible. They would persuade you that, of their ingredients, this one will warm the stomach, this refresh the liver; one go straight to the kidneys, and thence to the bladder, without exercising elsewhere its powers; another dry up the brain; another moisten the lungs. Of all these a drink being compounded—is it not something like sheer folly to hope that their virtues should be divided and drawn out of this mixture and confusion, and execute charges so different? I fear most truly, that they must lose or change their addresses on the road, and excite trouble in the wrong quarters."

No. 379.—HUNTER'S PORTRAIT.

When Sir Joshua Reynolds was attempting to paint Hunter's portrait, he had great difficulty in getting him either to sit still or place himself in a becoming attitude: his failures were numerous; but at last, when he had nearly finished an indifferent picture, Hunter one day fell into a deep reverie, which Reynolds immediately took advantage of; and having no other canvas at hand, he turned the picture upside down, and dashed in between the legs that sublimely thoughtful face of his genius sitter, which has been rendered immortal by the hand of the engraver Sharpe, although the precious original is decaying day by day.

THE FRENCH LUNATIC ASYLUMS.—The decree of March, 1858, has worked a most salutary change in the position of the Medical officers of these establishments, whose proper remuneration and advancement were formerly impeded by all kinds of underhand procedures. A new classification of Directors and Physicians of Asylums has been declared, and the minimum remuneration is fixed at 3000 francs—preventing a recurrence of former deplorable instances of utterly insufficient payment. The Minister of the Interior also has issued instructions that, as far as possible, all the vacant posts of assistants shall be filled up by pupils who have officiated as *internes*, to which posts none but hard-working and capable students are to be appointed. The Assistant-Physicians must also serve three years before they can obtain promotion. A system of retiring pensions has also been organised. The attendants are also to be organised into a regular hierarchy, comprising the *surveillant en chef*, *surveillants*, *sous-surveillants*, *infirmiers* of the first class and others of the second class, the pay varying from 400 to 200 francs. The female attendants, or *infirmières*, are divided into three classes, with a salary of from 250 to 150 francs, a small additional sum in all cases being given annually after five years' service in the Asylum.

SATURDAY, OCTOBER 29.

SUBURBAN AND CITY HOSPITALS.

A CONSIDERABLE degree of uneasy apprehension has been awakened by the rumoured probability that St. Thomas's Hospital may be removed from its ancient site and erected on a spot some ten or fifteen miles distant from London. Those who have a conservative dread of all change can scarcely realise the idea of the Borough of Southwark deserving its name after it has lost the ancient foundation which has remained on its present site ever since the year 1215; while a few prudent and somewhat nervous subjects are a little uneasy at the notion that in case of accidents to themselves or others, the metropolis will be deprived of one of the valuable institutions now open for their relief. There may also be some apprehension that the establishment, if transferred to a new site, would lose some of the Professional advantages it now derives from its situation in the heart of the metropolis. These objections whatever may be their value, are likely to be all overborne by those inexorable laws of growth and progress that distinguish the present age.

The authorities of St. Thomas's, though they have for a time lost the opportunity offered by the South Eastern Railway for making the great change, may be expected before very long to welcome with much satisfaction the opportunity afforded to them of securing for their in-patients advantages which are beyond their reach in the impure air of this vast metropolis. It may be expected that the funds the Hospital will receive in the form of compensation far more than enough to secure the purchase of a more eligible site, where the patients may have the benefit of pure air and water, and where advantage may be taken of our present experience in the construction of Hospitals on principles more favourable to the patients and to those under whose management they are placed.

It would, of course, be necessary for the Governors of the Hospital to provide a small establishment in town for the immediate reception of sufferers from accidents and attacks of acute disease, and for the transfer into the country of all cases that are likely to require lengthened treatment; so that the Metropolis may not lose the advantages to which it has been so long accustomed, and the patients may sustain no damage or inconvenience by their railway journeys to the country, performed in convenient ambulances. These cautious objections overcome by suitable means, would prove very small compared with the benefits that may be expected by a removal from the Borough to a healthy situation in the country.

The improvements derivable from the contemplated change will include, not only the difference between town and country lives, but the further difference between town and country Hospitals. It is now well known that small country Hospitals are more favourable to the patients than the overgrown structures of large towns. We have on a former occasion noticed the

statistics by which Dr. W. Farr shows that the sanability of the sick is greater in country Hospitals than in those of large cities—that while in Salisbury the deaths per cent. were 3·1, in Salop they were 3·7; in Winchester, 3·8; in Chester, 4·2; in Liverpool, 5·6; in Manchester, 7·2; in seven Hospitals in London, 9·0; and in Bristol, 9·5. To these illustrations may be added the awful rate of mortality in the vast Kraukenhaus of Vienna, as shown in a report published last year, which gives the rate of mortality in December, 1857, for men, 11·0; for women, 13·8; 12·0 persons. The numbers are below the average of the ten years 1848—1857, when the mortality was at the rate of 12·6 men, 17·0 women; 14·5 total. These facts tell the more powerfully in favour of the country as the best site for Hospitals, especially when it is considered also that the larger cities necessarily furnish a higher degree of Professional skill than can be obtained in the rural districts and smaller towns.

The pure and invigorating air of the country is a benefit too obvious to require any comment. It will be equally obvious that the country Hospitals have derived a share of their superior advantage from the smallness of their wards as compared with those in the larger towns and the Metropolis. The utmost care and science applied to ventilation will not compensate for the damage sustained by the patient when the great ward in which he is placed contains some fifty sufferers, who are all contributing those deadly emanations which poison the air he has to inhale, and which, even with the best regulations, is loaded with the germs of new disease and death. The removal of St. Thomas's, or any other great London Hospital, into the country will afford the opportunity of securing the isolation of the various groups of patients as effectually as if they were in the smaller country Hospitals. Instead of one large block of buildings containing a dense sickly population—too dense for health even where disease has not set in—the establishment might be so constructed as to carry out the various improvements suggested in Miss Nightingale's valuable "Notes on the Construction and Administration of Hospitals."

In the selection of the new site, it is scarcely necessary to say that the utmost attention should be directed to the water supply, as to quality as well as quantity. There is too much science in St. Thomas's Hospital to admit the possibility of this desideratum being neglected, and we should not have ventured even this hint if it had not lately been shown how possible it is for men of great intelligence and public spirit to build not even "near a good site," and where everybody is constantly saying, "We have a noble building, but we are sadly off for want of water." Nor will it be sufficient to assume from geological indications that the water "must come" if an artesian well is bored to a moderate depth. In spite of geology and experienced well-sinkers, it may not come, or there may not be enough, or its quality may not be pure when it is obtained. These, however, are matters of detail which may be discussed when once the principle is established.

THE WEEK.

We are authorised to state that a paragraph which has been copied from the *Court Journal* into various newspapers, stating that Sir James Clark had retired from the post he has held for so many years, as Physician in Ordinary to the Queen and the Prince Consort, is quite incorrect. It is very true—as we stated on the 30th of April last—that Dr. Baly was recently appointed Physician Extraordinary to the Queen, because "Sir James Clark is now approaching an age when his regular attendance on Her Majesty and the Royal Family might, from various causes, be interrupted; and it was not unnatural that the Physician who might ultimately become his successor, should be selected at an age consi-

derably junior to Sir James, in order to prevent the Queen and Royal Family being subjected to frequent changes of the ordinary Medical attendant." This is the true explanation of Dr. Baly's appointment, and of the fact of his recent attendance in the North; but the statement that Sir James Clark has retired is altogether premature.

The following gentlemen were elected Fellows of the College of Physicians of London on the 22nd inst.:—Drs. Humphrey Sandwith, Henry Hunt, Somerville Scott Alison, Dennis Embleton, Charles John Hare, Robert Barnes, Robert Martin, Dayrell Jos. Thackwell Francis, John Russell Reynolds, John Charles Bucknill, William Marcet, Charles Murchison, John Jackson, Sir Andrew Smith, Henri Gueneau de Mussy, Henry Mapleton, John Birt Davies, James Bird, Daniel Noble, Sir James Lomax Bardsley, Alexander Fleming, and James Richard White Vose. A second election of Fellows will take place in the course of a few days, the above being only the first instalment of the Year of Grace Fellows.

The Stockport Magistrates have fined Mr. Israel Ward, of Heaton Norris, *sixpence*! for assuming the title of Doctor without legal qualification. The defence was, that the defendant was merely an assistant to his father, who had a right to practise, having done so before 1815. The Bench stated very plainly that the defendant was quite wrong in assuming the title, and the prosecution may be looked on as successful, for Mr. Ward promised "not to be guilty of similar conduct."

At the Quarter Sessions at Hastings, on the 11th inst., a Surgeon, so-called, and a Graduate of Cambridge, was convicted of horse-stealing, and sentenced to eight months' hard labour. His defence was that he suffered from congestion of brain, had become an opium-eater, had lost his practice, was at times half mad, had a sister in a lunatic asylum, had had more than twenty children, was sixty-two years of age, and three hundred miles from home, had come to Hastings to improve his health, and had given a lecture there. That the man was mad is evident; and his punishment therefore was absurd.

We remarked when the Builders' strike was announced, that our Profession would ere long have to bear a part in the consequences which would necessarily result from it if long persisted in, by our gratuitous services being put into extensive requisition. Our prophecy turns out true, for we find from the recent returns of the Registrar-General, that the mortality among the wives and families of the operatives in the building trades is excessive. In fact, there is too much reason for the painful reflection that scores of innocent persons and young children are perishing from sheer want.

We have received from a correspondent a number of papers in which the character of one who belongs to our Profession appears to us to be very seriously involved. The largest of these papers sets forth that Surgeon Colston, Member of the London Royal College of Surgeons, and Member of the Royal Society of Literature (?), has discovered some wonderful medicine by which all kinds of deafness may be rapidly and infallibly cured. The document goes on to state, that "if sufferers will give a correct statement of their case, and apply the treatment according to instructions only, Surgeon Colston will guarantee a speedy cure, in many instances in a few hours' time, and at only the cost price of the invaluable

remedies used, as *fee for advice is not charged*." The italics are in the original. "No matter in what state the ear may be," proceeds this veracious announcement, "by this treatment a cure or relief is certain, putting the person for ever beyond requiring further advice or expense. The remedies to be applied will be forwarded in secure packages, so that there will be no fear of injury in their transit to any part of the world, or by any conveyance." Then follows a long printed list of persons who have been cured of deafness by the use of the invaluable remedies. We copy the following, omitting the names, the notes of admiration being in the original. "Mr. G. G., Bag-lane, Hayes; fourteen years deaf, and cured in one night! Mr. F. S., Notting-hill; born deaf! &c." We confess, that notwithstanding our long acquaintance with such advertisements, we are puzzled by the perusal of these papers. We remember the late exposure of the Bennett and Watters gang, and it will not be forgotten that the "invaluable remedies" used by that notorious confederacy were proved to consist chiefly of human urine. We imagined at first that "Surgeon Colston, Member of the Royal Society of Literature," might be a person of the same class: but this cannot be the case, as we find that Mr. Henry Samuel Colston is a Member of the Royal College of Surgeons of England, of 1851, and we know that by a well-known bye-law of that Corporation, advertisements such as those to which we have just adverted would be promptly noticed by the College. The only conclusion we can draw is, that some designing person has improperly made use of Mr. Colston's name for the purpose of deluding the public, and we think that it is incumbent upon him, in vindication of his own character and the respectability of the College to which he belongs, immediately to denounce the imposture.

As a proof that recent regulations as to the preliminary education of Medical men are by no means uncalled for, we publish an exact copy of a letter received this week from a Practitioner in the North of England by a gentleman who has forwarded it to us. We may remark that, although the writer says he has the "Medson Licence," his name does not appear on the Register.

"Oct. 21, 1859.

"Dear Sirs, I received one of your Prescription Books and after getting it to my surprise the Prescriptions are nearly all Latén & as I am not well rearend if you have any of them all English Print I would like if you would exchange it for me or send me one all English Prescriptions for I have the Medson Licence & I am for Trying the Medsons A little Sirs & By so doing you will Oblidge your Well Wisher, —"

ROYAL COLLEGE OF SURGEONS.—From a return just published, of the receipts and expenditure of the above institution from Midsummer-day, 1858, to Midsummer-day, 1859, it appears that the former amounted to £19,697 7s. 5d., derived from the following sources,—viz., court of examiners, £16,655 5s.; fellowship, £1449; *ad eundem* admission to membership, £88; certificate of membership, £5 5s.; midwifery examinations, £365 8s.; admission to council, £21; sale of lists of members, catalogues, etc., £20 13s. 9d.; and dividends on investments in Government securities, £1,092 15s. 8d. The disbursements amounted to £20,994 7s., divided under various heads, including a deposit of £850 on the purchase of a large house adjoining the College. From a summary of the whole, it appears that the incidental income of the College was £18,604 11s. 9d., and the incidental expenditure £17,305 12s. 2d. The permanent income of the College was only £1092 15s. 8d.; whereas the expenditure amounted to £3688 14s. 10d. From an analysis of the list of the College it appears there are at the present time 1226 fellows, of which number 233 have undergone the severe examinations, and 993 are honorary and elective fellows. Of members there are 13,000, making a total of fellows and members of 14,226; of this number 709 are licentiates in midwifery.

THE COLLEGE OF DENTISTS.

ON Tuesday evening Mr. Erichsen commenced a course of six Lectures on "The Surgery of the Mouth and Jaws," at the College of Dentists, and made some introductory observations on the relations of Surgery to Dentistry, which are well worth attention just now that it is proposed to give a special licence to Dentists by the College of Surgeons. The sentiments expressed by Mr. Erichsen, we feel certain, are those of the great majority of the Profession; and we trust that they will have their effect upon the Council at Lincoln's-inn-fields. He said that when he had been invited by the Council of that College to give them a short course of Lectures on the Diseases of the Mouth and Jaws, he had felt great pleasure in acceding to that request. From the first foundation of their College, he had taken a warm interest in the success of that Institution. Connected as he had been for many years with the teaching of Surgery in this metropolis, he could not but view with satisfaction the establishment of an Institution the object of which was to improve the education of those practising one branch of the Profession to which he belonged. In reflecting on the position of Dentists in this country, he had often been struck by one great anomaly connected with it. This anomaly was not that any man, educated or not, might establish himself in practice as a Dentist—for, monstrous as such a licence was, yet, in this respect, Dentists stood in exactly the same position as Surgeons up to the passing of the late Act. But the remarkable anomaly in the position of the Dentist was, that whilst every other branch of the Profession had its head and home, the Dentists had none. Whilst the Physicians possessed their time-honoured College; the Surgeons an Institution second to none in the country for scientific importance; the Apothecaries their Hall, which he believed had done more for the improvement of the education of the Practitioners of this country during the last five-and-forty years than both the other Institutions put together; and whilst the Chemists had more recently established their Pharmaceutical Society; so numerous, so influential, so intelligent, and so wealthy a body as the Dentists possessed no Central Institution in which they could be incorporated, and by which they might improve the education and status of their Profession. This appeared to him to be a great anomaly; and he was rejoiced to see it removed by the institution of such a College as this, in which the requirements he had just spoken of would be fulfilled. He knew that it was the opinion of many very eminent members of their Profession, that the College of Surgeons was the proper home for the Dentists; but he could not agree with those gentlemen who thought so, several of whom ranked among his intimate friends, for whose opinions he entertained a great regard. It was not his intention to enter upon this question at length—a *questio vexata* which was still under discussion, or to intrude himself into the politics of a body with which he was not directly connected,—but he must be allowed to say a few words upon the subject in explanation of the course of lectures he was about to commence. If you look to the education or the examination of a Surgeon, how do they fit him for, or test his competency in, the practice of dentistry, or what similarity is there between the practice of a Surgeon and that of a Dentist? When a young man intends becoming a Surgeon, he has to spend at least four years of the best and most active period of his life in the acquisition of professional knowledge. He has to dissect and study anatomy for three winters; he has to attend Hospital practice for a similarly lengthened period; he must attend to practical Pharmacy, to Midwifery, to Medicine, and many collateral branches as well. During the whole period of his studies he scarcely hears the teeth mentioned,—certainly their diseases are never mentioned. The same is the case when he presents himself at the College for examination. "I have never heard of the Examiners putting questions about the diseases and structure of the teeth; and I believe when they do so, that the probability is that they would find nine-tenths of the candidates unprepared to answer. However skilled a student may be in the anatomy of the perineum, in the coverings of hernia, in the distribution of the minutest arterial branch or nervous twig, I doubt whether there would be one in ten who could tell you how many milk-teeth there were, in what order they appeared, and when, how, or where the first perma-

nent molar showed itself. If you look to the practice of a Surgeon, what is there in common between it and that of a Dentist? A Surgeon has to set broken limbs, to operate for hernia, to cut for stone, to extract cataracts, to be engaged daily in the performance of a multitude of duties of a similar kind. His time is never his own; he can never be sure of any hour. But look at the Dentist. He is engaged in the practice of a pure speciality—the purest of all specialities—the very type of a speciality. I have never heard of any Dentist, though he might be a Member or Fellow of the College of Surgeons, engaging in Surgical Practice. I feel sure that if such a gentleman were called up in the middle of the night to operate on a case of strangulated hernia, or to puncture an over-distended bladder, he would at once say, "No, that is not my business; I am a Dentist. You must send for a Surgeon." I do not, of course, mean that there are not men in your Profession who could not do these things. I know there are men who might be competent to undertake them on an emergency; but what I mean is, that the feeling of the public, and I may say of our Profession even, would compel a Dentist to confine himself exclusively to the practice of operations on the teeth. Now, in this respect Dentists differ from all other specialists. The most eminent oculists of the day have been, and are, General Hospital Surgeons, engaged in the practice of Surgery in all its branches; they will cut for stone, and operate for hernia as skilfully as they can extract a cataract. The same is the case with Orthopædic practitioners. The most eminent in London, the founder of Orthopædic Surgery in England, is a Physician to one of the largest Hospitals, and is extensively engaged in general Medical practice. But the Dentist, as I have already said, is a pure specialist; he does not, and cannot, consistently with his own duties, depart from the Surgery of the Teeth. Now, this being the case, why should a pupil be compelled to go through a course of study that has no bearing upon his practice in after life? What use can there be in teaching a young man the minute anatomy of the surgical regions and the mode of performing surgical operations, which he can never be called upon to practise,—neglecting his own department of study—the teeth—in the cure of the diseases of which his after life will be spent? I believe it is not only useless, but positively injurious, to compel young men to a course of study which they know will lead to no practical result; to force them to acquire knowledge for the sole purpose of acquiring a professional title,—to learn what they can never be called upon to practise. I have had several students attending my lectures at various times who were placed in this position, and those to whom I have spoken on the subject have always complained of the hardship and drudgery and loss of time attendant on such a course of study. It was only this day that I was speaking to one of the most intelligent young men with whom I am acquainted, who is qualifying for a Dentist, but is studying to pass the College of Surgeons, and he told me that he felt that all his studies would be useless to him in after-life, and that the time so spent was in a great measure lost. As then neither the education of a Surgeon fits a man for the practice of dentistry, nor the examinations for a Surgeon test his competency so to practise, I cannot look upon a connexion with the College of Surgeons as in any way necessary to the Dentist, and I do not think that he ought to be compelled to pass through the portals of that institution before he is allowed to practise his own art. But though I do not consider a connexion with the College of Surgeons as necessary, there can, of course, be no objection to a Dentist qualifying himself as a Surgeon, if he thinks it expedient to do so. I look upon it as in the highest degree creditable to his industry and perseverance that he should do so, but let him become a member of the College of Surgeons just as he would become a Master of Arts or a Doctor of Philosophy. There are many men among you who, having been educated for the Medical Profession, and having taken their Medical Degrees, have found it more agreeable or more advantageous to practise as Dentists than as Surgeons or Physicians. Such men are an honour to both Professions, and to them my remarks necessarily do not apply. But though I do not think it at all necessary that every Dentist should be compelled to be a member of the College of Surgeons before he can be allowed to practise his art, I look upon it as equally, if not more, injurious that he should be allowed to practise that art without any special education to fit him for it, or any examination specially to test his competency in it. I

look upon it as a very great evil that this should be allowed; and I would be glad to see it rendered compulsory in every young man who intends to enter the Dental Profession that he has followed out a certain course of education to fit him specially for it, and that he has passed through one examination that will test his qualifications to engage in its practice. I think it is of importance that he should be specially conversant with the anatomy, physiology, pathology, and surgery of all the parts connected with the teeth and mouth. Now, such a course of study is offered in an institution such as this, and it is my earnest advice that those who intend to become Dentists should take advantage of it. So far as my lectures are concerned, they will consist of a short course of six, on the "Malformations, Injuries, and Surgical Diseases of the Mouth and Jaws." To-night we shall commence with the subject of hare-lip and cleft-palate; and I may say, that addressing a body of gentlemen who should be made specially conversant with these subjects, I shall enter more minutely and fully into them than I should think it necessary to do if I were addressing an audience of Medical students or Medical men."

Mr. Erichsen then explained in a very clear manner the mode of normal development of the jaws, and showed how arrest of development at various stages produced the different varieties of hare-lip. After some general remarks on the principles of the treatment of the malformation, he concluded a very interesting lecture amid general marks of approbation.

PROGRESS OF MEDICAL SCIENCE.

Selections from Foreign Journals.

ON ERGOT OF RYE IN HÆMORRHAGE OF THE UNIMPREGNATED UTERUS.

By Professor TROUSSEAU.

THE patient who was the occasion of this clinical lecture suffered from carcinomatous metrorrhagia; and her case furnished a new proof of a fact which is more common than it is generally believed to be, that the most frightful cancers of the uterus may reach their last stage without causing pain; while in other cases, a cancerous affection that has made but little advance, may give rise to intolerable suffering. In the year 1832, M. Trousseau, together with M. Maisonneuve, tried a series of experiments with ergot on a large scale, in uterine hæmorrhage, whether resulting from delivery, abortion, cessation of menstruation, carcinoma, or the presence of polypus or tumour. The results were, that the hæmorrhages of women recently delivered were rapidly arrested, this medicine being the most rapid and the most certain in its effects. Even when it is powerless it is entirely harmless; but, in general, its efficacy is real from the moment when uterine contraction commences, the hæmorrhage being arrested, although the woman may lose blood for some hours. The contradiction is only apparent. Hæmorrhage, is, in fact, not constituted by the flow of blood from cavities into which it has been long since poured, but by its leaving the vessels in which it is circulating. Now, when after delivery, we give the ergot to combat the inertia of the uterus, the primary cause of the metrorrhagia, we provoke the issue of the blood contained within the uterine cavity; and such hæmorrhage, which is only apparent, only ceases after the entire expulsion of the blood extravasated within a certain time. As to the real hæmorrhage, it is arrested by the contraction of the muscular fibres of the uterus, and the occlusion of the gaping sinuses.

In the hæmorrhages arising from abortion, advantageous results were also obtained; but the loss of blood was not arrested so rapidly as in hæmorrhage after delivery, and in the hæmorrhages which occurred at the period of the menopause, its operation was so slow and uncertain that preparations of rhathany or sulphuric acid were preferred.

The ergot was also tried in carcinomatous hæmorrhage, and to the great surprise of the experimenters, succeeded almost as rapidly as in post-partum hæmorrhage, and more rapidly than after abortion. Of course fungoid, or encephaloid cancers, from which a more or less sanguinolent sanies is always issuing, are not those meant, but cancer

accompanied by hæmorrhage, which returns every ten or fifteen days, lasting three or four days. In seeking for an explanation of this occurrence, we may compare the state of the uterus, when the seat of cancer, to the organ in the impregnated state—a hypertrophied state of the muscular fibres being present in both cases. Louis' researches have already shown us that in cancer of the stomach, there is hypertrophy of the muscular tunic, not only when the pylorus is the seat of the affection (which would be explained by the increased effort required to surmount the obstacle opposing the passage of the aliments into the duodenum), but also in cancer of the large curvature.

With respect to the influence of ergot on internal hæmorrhages in general, such as epistaxis, hæmatemesis, hæmoptysis, etc., the experiments were not attended with success, or success, when obtained, could not be positively attributed to the treatment employed. Nothing is more difficult, in fact, than to judge of the efficacy of a medicine in hæmorrhage, an accident which is so essentially temporary, and of such variable duration. It is not possible to determine upon the action of a hæmostatic, except when, in the same individual, the hæmorrhage, after being reproduced with its particular characters, is then suspended by the action of the remedy. A woman, for example, is the subject of metrorrhagia, which usually lasts four or five days; and if on giving her the ergot it continues only twenty-four hours, to return again in its ordinary manner on the suspension of the remedy, we may then decidedly assert that the medicine is of service. But the other varieties of hæmorrhage are essentially transitory, hæmoptysis, or hæmatemesis, occurring at near or distant intervals, never to be foreseen or determined. In the majority of cases, too, these bleedings stop spontaneously, and medicines that may have been administered, sometimes acquire a reputation which they have no right to. At all events ergot, or ergotine, has no advantage in these cases over any of the numerous other hæmostatic agents: and if it is more successful in the case of uterine hæmorrhage, it is not so because it acts upon the hæmorrhagic element itself, but because it exerts a special action upon the uterus, by virtue of which the fibres of this muscular organ undergo contraction.

Professor Trousseau concluded his lecture by referring to another case he had treated with large doses of digitalis, as recommended by Dr. Howship Dickinson. The hæmorrhage did not recur, but as it had already stopped prior to the administration of the medicine, the case proved nothing more than the innocuity of the medicine in infinitely higher doses than the Professor had ever before employed it. He thinks the method well deserves further investigation.—*L'Union Médicale*, 1859, No. 36.

ON THE RELATION OF FOOD AND RESISTANCE TO LOW TEMPERATURES.

By Dr. ISAAC HAYES.

The author was Surgeon on board the *Advance*, the vessel employed in the second Grinnell Arctic Expedition. "There is," he says, "a great misapprehension in the popular mind upon the subject of Arctic life. It is, I believe, pretty generally thought that Arctic travellers are necessarily subjected to great hardships in consequence of the lowness of the atmospheric temperatures, and that almost superhuman powers are required to resist it. This is, I can but think, a great mistake. The animal economy everywhere adapts itself to surrounding circumstances, and this power of adaptation is nowhere more strikingly exhibited than in the Arctic regions. The appetite and digestive powers are, doubtless, more intimately concerned than any other animal functions; and in the quantity and quality of the food consumed, we are led to look for an explanation of the cause which enables the inhabitants of Arctic countries so successfully to resist cold."

During the stay of the *Advance* at Reussellaer Harbour, on the west coast of Greenland, in 1853, the author was in frequent intercourse with a tribe of wandering Esquimaux, inhabiting the shores of the head-waters of Baffin's Bay. These people live almost without fire, so spare is their occasional supply of wood. Their huts are often built of snow, and the temperature, varying from zero to freezing point, is kept even thus elevated mainly by the radiation of heat from the bodies of the occupants. "Yet, with this seemingly unendurable temperature, they appear to live in comfort. The outside

temperature varies from 30° to 70° below zero. No matter how low, provided the air is calm, they do not hesitate to shift their quarters as occasion may require, and with their families and domestic furniture upon their sledges, they travel sometimes forty or fifty miles at a single march. My object in dwelling thus minutely upon the habits of this people you will readily appreciate. Living virtually without fire, most meagrely dressed, dependent upon the hunt for every necessary of life, and almost daily exposed in the pursuit of game to the very lowest temperature, we are astonished at their complete indifference to the cold. They are, too, a strong, robust, and healthy race; scurvy is unknown amongst them, and I have never known or heard of an instance of tubercular disease."

It is the quantity and quality of the food consumed which supplies this power of resistance, the daily consumption of animal food (the walrus, seal, narwhal, and bear forming the chief supply) being from 12 to 15 lbs.—about a third part being fat. In proportion as the diet of the *Advance* approached that of the Esquimaux, did impunity on exposure to a low temperature increase. A craving was felt for animal food, and especially for fatty substances, which in other latitudes would be exceedingly distasteful. "Frozen blubber became quite palatable; and during the second winter, when the temperature of the cabin was rarely above 45°, and often as low as zero, it was found necessary by Dr. Kane, in order to protect his men against the bad effects of the salt, to guard the slush barrels by the strictest orders. The process of acclimatization with us was gradual. I remember well how, in the autumn of '53, we suffered intensely from temperatures, which, a year later, produced no impression upon us; and I am satisfied that this increased power of resistance was in direct proportion to our ability to eat and digest animal food. During a later period of the cruise, some of the party lived precisely the life of the Esquimaux during three winter months, entirely without fire for the purposes of warmth, without suffering any serious inconvenience or discomfort from low temperatures."

Speaking of the ill effects of salt meat, mischievous not only *per se*, but also because a sufficient quantity of it cannot be eaten, Dr. Hayes mentions a singular effect it had upon the dogs, which had never been accustomed to such diet:—"They could not eat it except in small quantities, and the salt of the meat, the cold and the darkness, operating together upon their feeble bodies, developed a singular epilepto-tetanic disease, which ultimately destroyed nearly every animal which Dr. Kane took with him from South Greenland or afterwards procured." The same was, from time to time, observable among the men, and doubtless for the same reason.

The Esquimaux for the most part eat their meat raw, and the author strongly recommends this fact to notice, having often found the stomachs of scorbutic patients readily retain frozen, uncooked flesh, while they refused cooked meats. Freezing quite destroys the repulsiveness of raw meat; and the raw flesh of the seal and the walrus, especially if acidulated with a little vinegar or lime-juice, was very generally preferred by the sick. While fresh animal food, and especially fat, is essential in the Arctic regions, alcohol is not only useless, but positively injurious. "Circumstances may occur under which its administration seems necessary; such, for instance, as great prostration from long-continued exposure and exertion, or from getting wet; but then it should be avoided if possible, for the succeeding reaction is always to be dreaded. If given at all, it should be so in very small quantities, frequently repeated. I do not believe that it has a single useful property, not possessed in a ten-fold degree by other stimulants,—and under this head I rank tea and coffee. So valuable are both of these, that I am at a loss to say which is best. The English Arctic explorers almost invariably use tea, and so do the Russians; but Dr. Kane's party, after repeated trials, took most kindly to coffee in the morning and tea in the evening. The coffee seemed to last through the day, and the men seemed to grow hungry less rapidly, while tea soothed them after a day's hard labour, and enabled them to sleep better. They both operated upon fatigued and overtasked men like a charm, and their superiority over alcoholic stimulants was very marked. The virtue of coffee used under the above-named circumstances I cannot overpraise, the only drawback to its frequent administration being the difficulty of preparing it, when the atmospheric temperature is low, and

the traveller is obliged to depend upon a lamp with which to melt and boil his water."—*American Journal of Medical Science*, July, pp. 114—118.

EXCERPTA MINORA.

Remarkable Course of a Urinary Fistula.—A patient recently entered the St. Antoine Hospital, under M. Morel-Lavallée, suffering from stricture, and having several urinary fistulae in one of his thighs. Not a drop of urine was discharged by the urethra, and no instrument could be introduced. Although the attempt at catheterism was made with great precaution, an intermittent paroxysm followed, giving rise to the death of the patient in spite of the administration of quinine. At the autopsy, a vesical fistula was found traversing the horizontal ramus of the pubis, a true bony canal, in fact, existing, communicating with the fistulous tracts of the thigh, and with the point once occupied by the prostate, this gland being entirely destroyed. It is probable that in this case there was primary disease of the bone, the bladder becoming attached to it. The case is probably unique, although the examples of balls perforating the ramus, penetrating the bladder, and thus giving rise to a fistula, bear some analogy to it.—*Union Méd.* No. 114.

Applications in Acne.—When the affection is slight and recent, after removing all causes which seem to maintain it, we should always commence its treatment by stimulating, spirituous lotions, which may be employed tepid or even hot. When very slight, a large teaspoonful of the following solution, added to a glass of tepid water, may be applied night and morning:—*R.* Hydr. bichlor. 1; alcohol, q. s.; aq. dest. 100 parts. In certain forms of acne, especially the punctuated and sebaceous, local astringents effect a certain cure. M. Ferrat especially recommends alum or peroxide of iron—*R.* Alum, 30 parts; aquae, 300 parts. *R.* Ferri perox. half-a-part; axung, 30 parts. It will be better to commence with half these strengths, increasing them afterwards. The lotion may be applied night and morning, and the ointment on going to bed. In severer cases, protoiodide of mercury should be substituted for the iron, viz. protoiod. half-a-part, and lard 30 parts. The dose of the protoiodide may be afterwards doubled; and if the cure is long delayed, or imperfect, the bi-iodide must be substituted, employing from one to seven grains every evening. In intense acne we may commence with the bi-iodide.—*Bulletin de Thérap.* Tome lvii., p. 270.

Cherry-Laurel Water in Burns.—M. Franchini states that he has found this application of great service, even in very severe burns, while, even when these have been of large extent, it has produced no ill effect. He combines eight parts with one hundred parts of gum syrup (a mixture of tragacanth mucilage and simple syrup), renewing the application every twelve hours, moistening the compress a few minutes before attempting to detach it.—*Ibid.* Tome lvii., p. 331.

Influence of Smoking in the Production of Cancer of the Lip.—M. Bouisson, of Montpellier, has recently stated that the great increase of this affection is due to the practice of smoking; and the late M. Roux attributed also to this the fact of his having met with a larger proportion of cancerous affections of the lips during the latter than during the former half of his prolonged Surgical career. M. Fleury, of Clermont, is however, of a different opinion; for, deploring equally with M. Bouisson the pernicious practice of smoking, he doubts whether cancerous affections of the lips is one of its effects. Between 1845 and 1855, he has operated upon 86 patients, 71 being men, and 15 women, and not one of these being less than 43 years of age. They were all of the peasant class, chiefly from among the mountains of Puy-de-Dôme and the vicinity, where smoking is almost wholly unpractised. It is a remarkable fact that the inhabitants of the surrounding plains, and of the towns, where smoking prevails much more, are almost completely free from the affection.—*Gazette Médicale*, No. 35.

Fetid Sweating of the Feet.—M. Gaffard recommends as a most effectual agent, the applying between the toes of a few drops of the following liquid. An application once a week is usually sufficient, but during summer it may sometimes be required to be made daily:—Red oxide of lead 1 part, and the liquor of the subacetate of lead of the French Codex (3 parts of acetate, and 1 of litharge, to 9 of distilled water) 29 parts; bruise the sesquioxide of lead in a porcelain mortar, and add the liquor gradually, directing the bottle to be well shaken whenever it is used.—*L'Union Méd.* No. 102.

FOREIGN CORRESPONDENCE.

FRANCE.

PARIS, OCTOBER 24, 1859.

In a recent number of the *Medical Times and Gazette* one of your distinguished correspondents expresses some doubts as to the efficacy of the sulphate of quinine in large doses in the treatment of some of the phlegmasiæ, and more especially in acute rheumatism and peritonitis; and, as he stated at the same time, that he would be glad to have some details as to the treatment of these affections by the above-mentioned agent, I have much pleasure in placing before him three cases selected from many others which have come under my notice. They will be found to exhibit in a pretty strong light the connection existing between deafness and other symptoms resulting from quinic intoxication and its therapeutical action. These three cases were treated at La Charité, by M. Beau, of whose practice I have already spoken pretty fully on more than one occasion. The notes were carefully taken at the bedside of the patient, and all the details may, consequently, be strictly relied on.

Case 1.—C. R. aged 30; employed at the Paris Telegraph Office, admitted into the Salle St. Felix, January 23, 1859. This patient is of middling stature and thin, with blue eyes, fair complexion, and lymphatic temperament; has inhabited Paris since the age of eighteen, and has generally enjoyed good health. At the age of ten, had a first attack of rheumatism which lasted six weeks, since which he has been subject to cardiac palpitations; had a second attack of the same disease at the age of twenty; he now suffers from a third attack, induced by exposure to cold about a fortnight ago. On the present occasion the knees were first affected, but other parts of the body soon became involved. No active treatment hitherto had recourse to. The patient is lying on his right side, and is quite unable to assume any other posture; the left knee is the seat of considerable tumefaction, attended with heat, redness, and intense pain; it remains half bent, and all movement is impossible. Although not so seriously affected, the right knee also is swollen, red, and painful; no fluid is perceptible in either of the two articulations; the left shoulder and elbow are also the seat of very considerable pain, and all the metacarpo-phalangeal articulations of the left hand are red, swollen, and painful. On auscultation, a rough murmur is found to accompany the second sound of the heart; it extends over a large space, but its maximum is observable at the base of the organ; there is considerable dullness over the precordial region; the pulse is strong, full and jerking, 80; skin hot, and covered with profuse perspiration; tongue furred, thirst, and loss of appetite; bowels regular. Diagnosis pronounced by M. Beau, "Acute rheumatism, with insufficiency of the semilunar valves." January 24.—Two grains of tart. antimon. are prescribed, which induce copious evacuations both from stomach and bowels. January 25.—The pulse remains at 80, though the patient is in other respects very feverish. M. Beau supposes that, in a state of health, this individual's pulse is naturally slow; the joints are swollen, painful, and stiff. Ordered sulph. quinae, grs. xxvij., in a potion, to be given in three doses—at midday, eight in the evening, and four in the morning. January 26.—No marked effect produced by the quinine, the patient having been deaf only about half-an-hour; the articulations as painful as they were yesterday; pulse 80. Ordered quinae sulph., grs. xxxvj. January 27.—Marked symptoms of quinic intoxication from noon until eight in the evening, the patient having been deaf all the time; the joints are much better; pulse 80. January 28.—The deafness is increased; pain and swelling of the joints diminished; pulse 72. January 29.—The pain, redness, and swelling of the joints have disappeared; pulse 64. The appetite is returning; ordered two soups. January 30.—Pulse 60; the patient doing well. February 3.—Pulse 56; patient continues in a very satisfactory state; the sulphate of quinine is reduced to grs. xxvij. February 5.—Pulse 52; patient no longer deaf; joints continue quite free from pain; the quinine is reduced to grs. xvij., and the patient is allowed one portion of solid food. February 6.—The quinine is now entirely discontinued.

February 7.—Has been up all day, and feels remarkably well; appetite good. February 12.—Was to-day discharged cured.

Case 2.—P. M., married, aged 43, private coachman, admitted into the Salle St. Felix, January 28, 1859. This patient is stout, short, and thick-set, with dark eyes and black hair; face very pale; has lived in Paris for the last twenty years. Had a first attack of rheumatism about eleven years ago, which was slight, but which made a permanent impression on his heart, as evidenced by palpitations to which he has been subject ever since; in other respects has enjoyed good health. His present attack of rheumatism commenced six weeks ago. The left knee was first affected; but after a short time the right also became implicated. The patient lies on his back, and can with difficulty move; the palpitations are stronger than usual, accompanied with a little dyspnoea. The left knee is red, swollen, painful and stiff; the right knee, the ancles, and the left shoulder are also much affected; the passage of the extensors under the annular ligament of the tarsus is peculiarly painful; all extension of the feet or movement of the toes is impossible. Auscultation reveals a rough murmur, accompanying the first sound of the heart, which extends over the entire precordial region; but has its maximum of intensity at the apex; a soft murmur attends the second sound, exclusively at the base of the organ; considerable dullness exists over the cardiac region, and the heart's pulsations are excessively strong. Pulse, 92; full and rebounding; the carotids are also the seat of a rough murmur, which immediately precedes the second sound of the heart. Lungs healthy; tongue furred; loss of appetite and intense thirst; bowels regular, skin hot, and covered with a profuse perspiration exhaling an acid odour.

Diagnosis of M. Beau is Acute Rheumatism attended with Mitral Stricture and insufficiency of the Semilunar Valves.—January 29.—Two grains of tart. antimon. are prescribed, to be followed, as soon as the vomiting shall have ceased, by thirty-six grains of the sulphate of quinine exhibited as in the preceding case. January 30.—The stomach has been relieved of a large amount of bile, and patient feels more comfortable; he is almost entirely deaf; the joints are less painful; pulse has fallen to 76. January 31.—Continues to do well and remains deaf; the pulse has, however, risen to 88. February 1.—The rheumatic pains have returned; he is no longer deaf; pulse, 92; sulphate of quinine increased to fifty-four grains. February 2.—He is quite deaf; pulse fallen to 76; the joints still a little painful. February 3.—Continues to improve; pulse, 72. February 4.—The patient is greatly agitated, having received bad news from home; tongue furred; constipation; pulse, 88; deafness continues; is ordered two grains of tartar emetic, while the quinine is to be continued. At five in the afternoon the patient had had copious evacuations; pulse, 100. February 6.—Feels relieved; deafness continues; pulse, 76; joints free from pain. February 7.—Continues to improve; deafness persists; pulse, 72; appetite returning; sulphate of quinine reduced to forty-five grains; two soups ordered. February 8.—Is much better; the joints are in their natural state; pulse has fallen to 68; appetite good; deafness continues; quinine reduced to thirty-six grains. February 12.—Quinine is entirely suppressed; ordered one portion of solid food. This patient remained in the ward until March 12, on account of his heart disease; but during the whole of this time he was quite free from rheumatism.

Case 3.—L. F., waiter, aged 23, admitted into the Salle St. Felix, September 18, 1859; small in stature, dark eyes and brown hair, complexion rather pale, and has the look of having been badly fed; has lived in Paris since the age of 18. Three years ago had a first attack of rheumatism, which lasted three months; had a second attack in January last, and is now suffering from a third attack, which commenced yesterday. Both knee-joints invaded at once. Patient is sitting up in bed; the lower limbs alone being affected. The knees are red, hot, swollen, and painful, more especially the left one; all movement of which is impossible; both limbs are extended. On auscultation a very slight murmur is heard to accompany the first sound of the heart, heard only, however, over a very limited space over the apex; skin hot and dry; pulse 100, strong and full; tongue furred; loss of appetite; intense thirst; bowels regular. *Diagnosis:* Acute Rheumatism attended with very slight Mitral Stricture.—September 19.—Two grains of the tart. antimon. prescribed which produced free evacuations. September 20.—Patient

feels relieved; pulse, 92; joints still very stiff and painful; ordered twenty-seven grains of sulph. quinae. September 21.—Is quite deaf; pulse, 76; joints still painful. September 22.—Pulse fallen to 60; complete deafness; swelling of joints much diminished. September 23.—Pulse, 60; deafness continues; joints no longer painful; the murmur attending the first sound of the heart is now very faint. September 24.—Pulse, 56; continues to improve. September 26.—Pulse, 52; the joints now in their natural condition; the quinine reduced to eighteen grains per day; two soups ordered. September 27.—Pulse, 52; patient feels a little giddy; deafness continues. September 28.—Pulse, 54; no pains in the joint; deafness persists; quinine is reduced to nine grains daily; one portion of solid food ordered. September 30.—The quinine is entirely suppressed. October 8.—Patient quite free from every symptom of rheumatism, and the sounds of the heart being all but perfectly normal, he is transferred to the Convalescent Asylum.

GENERAL CORRESPONDENCE.

ON FŒTAL AUSCULTATION.

LETTER FROM DR. ALFRED MEADOWS.

[To the Editor of the Medical Times and Gazette.]

SIR,—In your impression of last week a most interesting "Case of Aortic Aneurism occurring in a Pregnant Woman" is recorded, to which is appended some "Remarks on Fœtal Auscultation," which I venture to predict will be received with no little surprise by any at all acquainted with the present state of obstetric science. That we should be asked to give up all the well-recorded observations and experience which have been made in uterine auscultation during the last forty years, and to denounce the valuable information which the stethoscope affords in many very important points in midwifery practice, is a demand which, however sincerely made, will, I am confident, be most stoutly rejected.

It seems to me that the theory which Dr. Adams has set up to explain away this most critical subject, affords some insight to the "mental phenomena" of which he is the victim, and I doubt not there are many who will believe that he does not hear the sounds which he might hear, simply because he "has an intense persuasion" that he shall not hear them. Doubtless, cases do now and then occur in which great difficulty is experienced in detecting either the uterine or fœtal sounds, in others they may be thought present when in reality absent, mistakes of both kinds may and do occur with the most practised ears; but surely these exceptional cases are not to imperil the general results. Dr. Adams seems to have been very unfortunate in his experience; but there are a thousand others who have met with very much greater success, and one cannot help thinking that if Dr. Adams would listen more patiently and with an unbiassed mind, he, too, might more frequently hear, not one only, but both sounds, provided, of course, that pregnancy exists, and is far enough advanced.

With regard to the frequency of the fœtal pulse, I have counted it at 28 and at 35 the quarter minute. Why the note of exclamation is affixed by Dr. Adams when remarking upon this frequency I cannot quite understand; for surely he must often have met with a pulse in acute disease in the adult very nearly if not quite as frequent as this; and in such cases he will find it much easier to count with the stethoscope applied to the chest, than with the finger on the wrist. That the fœtal heart may sometimes beat as slowly as 80 per minute I can quite imagine, though I have never met with it, and should certainly doubt it as a general rule. The uterine *soufflet* may be much more constantly heard, at least it is more easy of detection; and at the seventh month I have never failed to find it; that it should be more frequently heard than the fœtal sound can easily be explained, for while the seat of the one is constantly within reach, that of the other, from the freedom of the fœtus to move in utero, may sometimes be beyond the reach of the ear.

But even Dr. Adams admits that "pulsatory sounds" and "*soufflets*" may be "occasionally detected," and if he will not then admit the explanation which is given of them, why

does he not offer some other solution of the fact? and when sounds are heard to proceed from the gravid uterus, which in frequency, rhythm, and character, exactly resemble those heard in the new-born infant, where is the extraordinary gullibility in the man who believes that they are identical? That the *soufflets* are placental is a much more doubtful affair; indeed, I believe it is now more than generally believed that they are not; but, whatever may be the cause, that they do really exist, and may most frequently be detected, no one whose ears are not morbidly dull or voluntarily closed can deny. As to the ghost-stories which Dr. Adams cites, many others equally curious and exciting might be related; but I am not disposed to adduce them either to prove or disprove such important points as are here discussed; these are facts which are as surely attested as any which the stethoscope has ever revealed, to deny which is only to add another proof to the saying that "There are none so deaf as those who won't hear."

I am, &c. A. MEADOWS, M.D.

Physician-Accoucheur to St. George's and St. James's Dispensary.

LOSS OF BLOOD IN FEVER.

LETTER FROM DR. MARKHAM.

[To the Editor of the Medical Times and Gazette.]

SIR,—M. Trousseau calls attention, in a lecture lately delivered by him on the subject of Typhoid Fever, to the fact, that those cases of the fever in which hæmorrhage from the bowels occurs are rarely fatal. Dr. Graves, he says, long ago pointed out this circumstance; but in those days M. Trousseau could not believe in its correctness, so imbued was he with the long and generally-accepted proposition, that the symptom in question is a most serious and fatal indication of the progress of the disease. Later, and more extended experience, however, has convinced him of the truth of the remark; and he gives the results of his own observation, which certainly fully corroborate the statement of Dr. Graves. My own less extended observation also agrees with it. I here refer to the point, because in a few cases of intestinal hæmorrhage in fever, which have occurred under my own observation in St. Mary's Hospital, I have called the attention of the students to the fact that large quantities of blood may be lost under such circumstances without producing any remarkably depressing influence upon the patient. I think the fact is of much interest in reference to the subject of "Bleeding in Diseases;" and may assist in giving us some hint or clue to the unravelling of this mysterious, and all-disputed subject of therapeutics. Indeed, it was in reference to the question of "Bleeding," that I called attention to the cases above spoken of.

Here, then, is a disease—if any may be called so—of a purely adynamic type; and one whose treatment, at the present day, about the last thing which would enter into the head of the Physician would be the abstraction of blood. The taking of blood, indeed, in typhoid fever would be looked upon as something approaching to the destruction of the patient. And yet, notwithstanding, we observe patients suffering large losses of blood from the bowels in this disease—in its somewhat advanced stages, too—without suffering any corresponding depressing symptoms, such as we anticipate would result from a formalised venesection. How are we to reconcile the discrepancy between theory and fact? Theoretically, bleeding should be a most prejudicial symptom in this disease. Practically, the very large majority of those who suffer from intestinal hæmorrhage during its progress recover; and, according to M. Trousseau and Dr. Graves, are relieved by the hæmorrhage.

If there be no mistake in the correctness of the view held by these gentlemen, it follows clearly, that we over-estimate greatly the injurious effects of loss of blood in fever and many other diseases; the loss of blood may be of no service therapeutically, but it is not so baneful as heretofore supposed. Everyone who attended the practice of Dr. Craige, some years gone by, in the fever-wards of the Edinburgh Hospital, will recollect the continual abstractions of blood which were going on in those wards; and yet there has never been any proof given that the results of Dr. Craige's practice, as shown

by the bills of mortality of the Hospital, were more unfavourable than the results of the Port-wine treatment adopted in the wards beneath his own.

I have elsewhere stated, and I venture to think the statement is corroborated by the fact above alluded to, that large losses of blood are most especially dangerous in those cases in which the function of the lungs is seriously and extensively arrested by disease. In such case the prime or chief blood-making agent of the body is stopped in its work, and according to the extent of the disease. So long as the lungs are thus impeded, and in proportion to the amount of them diseased, is the sanguificating process arrested. Loss of blood under such circumstances is, therefore, an irreparable loss. In fever, so long as the lungs remain unaffected, the blood lost may be replaced, if not by food, at all events by the waste of the tissues carried to them through the absorbents, in the shape of lymph.

I am, &c.

W. O. MARKHAM.

SOME SUGGESTIONS FOR DIMINISHING THE ABUSES OF MEDICAL CHARITIES.

LETTER FROM MR. KNAGGS.

[To the Editor of the Medical Times and Gazette.]

SIR,—I am induced by a leading article in a late number of your Journal to make you acquainted with some suggestions contained in a Paper on the "Abuse of Medical Charity," which I was accidentally prevented, from reading at the late Social Science Congress at Bradford; and in this place I confine myself to a simple statement of the propositions themselves, without any reference to the information and arguments upon which they are based.

1st Proposition.—Societies should be organised throughout the country for the insurance of Medical relief to the poor and working classes, and to others of limited means, and that these societies should be established upon the principle of graduated payment according to income, as suggested by Dr. Ogle.

2nd.—Out-door paupers, *i. e.*, those receiving relief out of Union houses, might at option be insured in, and admitted to, the privileges of other members of such institutions at a fixed rate.

3rd.—A charitable fund should be formed in connexion with these insurance societies, to provide for the admission of necessitous cases.

4th.—Every qualified Medical man practising regularly should be permitted to attach himself to these societies, and to attend, under proper regulations, those members who choose him as their doctor.

5th.—Members of benefit clubs should not be admitted to the privileges of these societies at any fixed rate; the payment of each club member should depend, as in other cases, upon the amount of his individual income.

6th.—No out-patients should be admitted to the benefits of our public Hospital charities, unless they bring with them a letter of recommendation either from the Medical officers or the working committee of these insurance societies.

I wish particularly to invite your attention to the last proposition, because it appears to me to be the only effectual way of sifting the out-patients and diminishing the gigantic abuses of our out-patient charity. No doubt it would greatly diminish the numbers of the out-patients of our charities, and send a more proper stamp of cases, while it would enable the poor man, in fit and proper cases, to obtain gratuitously (but not as now indiscriminately) the services of the highest grades of the Profession.

I am, &c.

Huddersfield, Oct. 18, 1859.

SAMUEL KNAGGS.

THE "FELL" TREATMENT OF CANCER.

[To the Editor of the Medical Times and Gazette.]

SIR,—In 1856 I was requested by a valued friend to examine his wife's breast. I found a tumour, which I conceived to be malignant. The glands in the axilla were unaffected, the skin healthy, the nipple normal. My friend, at my request, took his wife to a most able Surgeon, who

confirmed the opinion I had given as to the nature of the disease, and as to the advisability of its removal by the knife.

Circumstances placed her under Dr. Fell's care, and the details of treatment I derived from her husband. Dr. Fell informed the husband that under his treatment only 20 per cent. suffered recurrence of the disease, whereas, in ordinary surgical treatment, 80 per cent. relapsed.

On May 12, 1856, Dr. Fell commenced efforts to disperse the tumour, the means being various ointments, used alternately. This lasted till August.

One of the applications was followed by a "gnawing or aching in the breast, which at times was scarcely supportable."

In September she went to the sea, furnished with Dr. Fell's applications, which produced such "drawing" pain that it was "a time of much suffering."

In October she again saw Dr. Fell, who advised the removal of the tumour, which had greatly increased in size. She was led to believe that the "pain of the process was not worth speaking of."

On October 11, the skin of the breast was destroyed by nitric acid to the extent of a circle four inches in diameter. The "smart was very trying; went on augmenting for several hours exactly like a severe burn."

On the 12th, the raw surface was "scored" with a scalpel. These scores were deepened day by day, till they were capacious enough to receive strips of linen rag, covered with a "purple mucilage." About an hour after these were inserted, "the breast began to be the seat of an aching, piercing pain," which compelled the poor sufferer to "wander up and down her narrow room, unable from her agony, to lie, sit, or stand." This continued several hours!

When the incision had reached an inch and a-quarter in depth, Dr. Fell declared he had reached the bottom of the growth. He then applied a "girdle" (of caustic, I suppose,) round its base, and in four weeks (November 22) the dead mass tumbled out, "in size and shape like a penny bun," only black.

The patient and her husband exulted.

Two days afterwards, Dr. Fell decided that there remained a portion, which, though he "could not say it was cancerous, he deemed it prudent to take away."

On December 17, the interval having been filled with a repetition of the former agonies, a lump as large as a hen's egg was detached. "Pimples" were forming under the arm, and though Dr. Fell thought lightly of them, the patient and her husband were not quite so confiding as they had been in his opinion.

On December 22, Dr. Fell proposed to "take out another piece from under the arm." "What then?" inquired the patient. "Then I must treat the other part on the inner side of the breast." "But how do you account for the spreading of the disease?" "Oh, it is in your blood."

Poor thing! she calmly went home. During this season of protracted torment, her general health had entirely given way, and in February, 1857, she died hectic.

I am, &c.

SOCIAL SCIENCE ASSOCIATION.—DEPARTMENT OF PUBLIC HEALTH.—Friday, October 14th.—C. Baker: "Vital Statistics, and Distribution of Deafness and Dumbness in England and France." Rev. J. Fawcett: "The Use of Intoxicating Drinks not necessary to Workmen engaged in Mines and at Forges." C. H. Bracebridge: "The Ventilation of Ships." M. A. Baines: "The Practice of Hiring Wet-nurses—especially those from the 'fallen'—considered as it affects Public Health and Public Morals." G. V. Vernon: "The Meteorology of Scarletina." The foregoing papers were on the list for Friday, but, for want of time, were not read.

WESTERN MEDICAL AND SURGICAL SOCIETY OF LONDON.—On Tuesday last the fourteenth session was commenced at the rooms in Sloane-street, on which occasion a *soirée* was given to the members and their friends by the President and Council of the Society. Various objects of interest were exhibited on the tables, Mr. Pillischer lending his valuable microscopes for the occasion. The interesting collection of scientific portraits by Messrs. Maull and Polyblank also excited much attention, as did a collection of drawings by Sir Charles Bell, which was kindly lent by University College. This was a very pleasant scientific re-union.

REPORTS OF SOCIETIES.

MEDICAL SOCIETY OF LONDON.

SATURDAY, OCTOBER 8, 1859.

A Paper, by HENRY THOMPSON, F.R.C.S., M.B., was read—

ON THE VALUE OF INTERNAL INCISION IN THE TREATMENT OF OBSTINATE STRICTURES OF THE URETHRA.

Mr. Thompson commenced by observing that it was not his object to advocate any particular method of treating stricture as the exclusive one, or even as of very general application. In no complaint was there more necessity for exercising a sound discrimination as to which of the various methods sanctioned by experience should be adopted in each individual case. He introduced the subject of internal division of stricture as a mode of treatment which, when properly applied, is one of extreme utility in some of those exceptional cases which had been found not amenable to dilatation. He was prepared to substantiate this statement by the records of a considerable experience. He thought that the many hazardous modes of performing the operation which had been practised at various times and places, but especially on the Continent, had by their bad results naturally raised some prejudice against internal incision altogether. But it would be his endeavour to discriminate between these modes, and to point out one which had been proved safe and satisfactory in a very high degree. There are two classes of cases to which the author conceived internal incisions to be applicable:—

1. Those in which the stricture is so unyielding that no dilatation, simple or continuous, materially enlarges the passage or ameliorates the symptoms; such examples usually occurring in patients who have been subject to the complaint for twenty years or more, and who have undergone repeated and long-continued courses of treatment. 2. There is a class of cases for some of which, severe and obstinate stricture having occurred in comparatively early life, internal division appeared to be the most appropriate treatment. For these, the object of the operation is not only to remedy present difficulties (as in the preceding class), but also to anticipate future ones, since it is almost absolutely certain that serious, if not fatal injury will result long before the term of life is past, where during the early part of it a severe stricture is established and merely palliative treatment is applied. He believed it to be a question which we are bound seriously to consider, whether it may not be more desirable to cure the patient if possible before extensive urethral disease has been set up, or organic complaints in the bladder or kidneys have been established, than to postpone the attempt until such changes either threaten or have taken place, and the effect of palliative measures has been well nigh exhausted. This is a view of the subject which, in the author's opinion, has not been sufficiently considered. The manner of performing internal division of the stricture was next described. During the last few years Mr. Thompson had studied the modes generally adopted both at home and abroad, especially the latter, and had made it his business personally to examine and estimate them; the consequence of which was that he had employed the method about to be considered, and with a success, which gave him a high opinion of its utility. For the successful practice of the operation the three following conditions must be complied with:—1. The cutting instrument must be passed through the stricture, and the incision be made from behind forwards, that is towards the orifice of the urethra, not from before backwards. 2. The limits of the stricture being first accurately defined, the whole of the contracted part should be divided. 3. The borders of the incision should be maintained apart by catheterism subsequently performed, and healing of the incision by first intention be thus prevented. After dwelling on each of these points at some little length, Mr. Thompson invited particular attention to an important point in connexion with the kind of stricture to which incisions are applicable. He was anxious to combat a very generally-received opinion that the narrowness of a stricture

is the measure of its severity, an opinion which is wholly erroneous and productive of grave error in practice. The truth is that a very narrow stricture, for example, one admitting only an instrument of the size of No. 1, sometimes produces comparatively slight symptoms, and is easily amenable to dilatation, while there are exceptional cases in which a stricture is by no means narrow, admitting say No. 4 or 5, but which is quite non-dilatable, and is accompanied by most severe symptoms. Narrowness, *per se*, is not therefore the gauge of severity. The most important characters of organic stricture, whatever may be its calibre, are non-dilatability and contractility; the former denoting a condition in which the tissue constituting the stricture is so unyielding that dilatation, however carefully employed, does but slightly enlarge its calibre, or improve the symptoms; the latter denoting a quality, through the agency of which, whatever temporary effect may be produced by dilatation, the original degree of narrowing reappears almost immediately after ceasing to employ the instrument. The erroneous belief referred to is exemplified in the remark so frequently met with, that if a No. 4 or 5 can be passed, any incision must be unnecessary. The fact, however, is that not merely the calibre, but many other conditions of the stricture, and also system at large, must be considered before it is possible to come to a conclusion respecting the kind of treatment which should be adopted. These points were discussed in detail by the author. There was one important fact in relation to non-dilatability, viz., that this particular quality of the stricture appears generally to be developed in proportion to its proximity to the external meatus; so that those cases for which incision is most indicated, are precisely those in which the incision is rarely accompanied by any risk whatever. The instrument which Mr. Thompson considers to supply the best method of fulfilling all the indications required in the majority of cases, is the urethrotome employed by Civiale for fifteen years past, and now slightly modified from the original pattern. The mode of employing it was minutely detailed, and the after-treatment described. For cases in which the stricture is too narrow to be treated by this instrument, Mr. Thompson employs a simple urethrotome of his own design. The accidents which might happen after internal incisions were then discussed and considered from the facts presented in the careful observation of forty-two cases treated by the especial form of urethrotomy described. These accidents were proved to be slight, and in no single instance had led to a fatal, or even threatened a dangerous result. The important fact, said the author, is this, that, in most cases it is in our power by internal urethrotomy to replace a confirmed non-dilatable stricture by a condition of the urethra, in which the occasional use of an instrument maintains the normal calibre. In this manner we may confer upon the patient a benefit of no ordinary value, not only in relation to the removal of present symptoms (which may be accomplished equally by other methods); but in the prevention of those more serious evils, which with certainty arise in the course of advancing age. It is this which has long been an important desideratum in practice; unhappily it has been the custom to regard too much the present results, and too little the future difficulties in our treatment. Most triumphant is dilatation in regard to the present in the great majority of cases, but in a certain proportion of them it does but postpone the evil day. He claimed for internal urethrotomy, when properly applied to appropriate cases, the position of an admirable adjunct or supplement to dilatation. It was on no account to be regarded as a treatment antagonistic to or competitive with dilatation, but as often rendering wholly amenable to that process a stricture which had been completely rebellious to it before. Finally, Mr. Thompson presented the details of eight cases, which he had taken from his own practice as illustrations, each one of which had been treated by him either in the public wards of University College Hospital, or in connection with some Medical man, whose name was given as corroborative of the statements made. The results were of the most satisfactory nature.

SPANISH DOCTORS.—Several Professors of the town of Murcia have been deprived of their offices in consequence of their having left the town during the time in which the cholera was there.

QUARANTINE.

At the recent Meeting of the National Association for the Promotion of Social Science at Bradford, in the Section of Public Health, presided over by the Right Hon. W. Cowper, a preliminary Report from the Sub-committee on Quarantine, which had been appointed by the Association last year at Liverpool, was read by Dr. Milroy, the Honorary Secretary of the Sub-committee.

The Queries, which had been drawn up with much care for the purpose of eliciting authentic and exact information on the divers topics connected with this intricate subject, have been extensively circulated. The Earl of Shaftesbury, the then President of the Section, brought them under the attention of the Foreign and the Colonial Secretaries of State, with the view of having them sent to all British Consuls abroad, and to the Governors of our different Colonies. Lord Malmesbury and Sir E. B. Lytton cordially approved of the scheme, and immediately took the necessary steps to carry into effect the wishes of the Sub-committee.

Already a large amount of valuable material has been obtained through these channels, the replies of upwards of seventy Consuls in almost every part of the world, and of at least twenty Colonial Governors, having come to hand. Many of these replies are accompanied with important illustrative documents.

The Directors-General of the Army and Navy Medical Departments also, both of whom are members of the Sub-committee, caused copies of the queries to be forwarded to their principal Medical officers serving abroad, inviting the co-operation of these gentlemen in the inquiry. A good many answers from both services have been received.

Application was likewise made to the Medical officers of the Royal Mail-packet steamers, which leave Southampton for the Mediterranean, the West Indies, and South America; but as yet no replies have come in from this channel.

Dr. Foote, of Constantinople, who, from having acted as Medical Inspector under the General Board of Health, and subsequently served in the Crimea, has long had his attention drawn to sanitary inquiries, has, in conjunction with other gentlemen in that city, formed a committee there to carry out a local examination of the working of Quarantine in Turkey, and has undertaken to communicate the results of their labours to the Association.

By means of the information from these various channels, the Sub-committee will be enabled, it is believed, to draw up for the meeting of the Association next year a report which will materially elucidate the system that has hitherto been pursued, and thus aid in the solution of one of the vexed social problems of the day in which the public generally, as well as the Medical Profession, are deeply interested.

As the results of the International Quarantine Conference, which was held in Paris in 1851, and at which Medical and consular delegates from most of the European States attended, have never been made publicly known, it was deemed advisable that an account of their proceedings, and of the principal conclusions at which they arrived, should be prepared. The official minutes of their meetings (which were printed by the French Government, but not published) were accordingly carefully examined, and a summary of their contents drawn out. This formed the subject of a second paper read by Dr. Milroy at the Bradford meeting.

It was the more necessary that the proceedings of the Conference should be ascertained, as it had transpired that the majority of the Powers, including this country, represented by their delegates, had declined to adopt and ratify the Convention that was drawn up, several of the articles being considered very objectionable. It is understood that at the present time the subject is again under the consideration of the different Governments, and that meetings are now being held in Paris among the consular delegates, in the hope of arriving at some uniform and reasonable line of practice. The existing state of things is, in many respects, acknowledged to be inconsistent with common sense as well as with Medical science, while it is felt to be most vexatious and oppressive to commerce and international intercourse.

We are indebted to Dr. Milroy, the Secretary of the Committee, for the above statement.

MEDICAL NEWS.

APOTHECARIES' HALL.—Names of gentlemen who passed their Examination in the Science and Practice of Medicine, and received Certificates to Practise, on Thursday, the 20th October :—

BARRETT, ALFRED EDWARD, Eton, Bucks
GORDON, PETER, East Indies
GRABHAM, CHARLES
GRIFFITH, JOHN, Bangor, North Wales
JONES, JOHN, Cliftonville, Brighton
LAWSON, JOHN EDWARD SPENCE, Egremont, Cumberland
THORNHILL, DAVID CLARKE, Stratford, Essex

The following gentleman also on the same day passed his First Examination :—

BROWNE, FRANK HARVEY, Stowe Maries, Essex

UNIVERSITY OF ST. ANDREWS.—List of Gentlemen on whom the Degree of Doctor of Medicine was conferred, 21st and 22nd October, 1859 :—

ADAMS, JAMES, M.R.C.S., Farmingham
ALLEN, JOHN, M.R.C.S., L.A.C., and L.M., Longton, Staffordshire
ANDREWS, OSWALD, M.R.C.S. and L.A.C., Monmouth
BLAKE, ROBERT H., M.R.C.S. and L.A.C., London
BLOXAM, WILLIAM, M.R.C.S., London
BOGGE, EDWARD B., M.R.C.S., L.A.C., and L.M., Newthorpe, near Nottingham
BUCHANAN, JOHN H., Lanarkshire
BUCKMASTER, WILLIAM, M.R.C.S., L.A.C., and L.M., Co. Cork
CHAPPELL, JOHN JAMES, M.R.C.S., L.A.C., and L.M., Axmouth, Devon
CLARKE, JOHN, L.R.C.P. and M.R.C.S., London
COCKCROFT, MIDGLEY, M.R.C.S. and L.A.C., Masham, Yorkshire
COGHLAN, JOHN J., M.R.C.S., London
DAVIS, HENRY, F.R.C.S. by Exam. and L.A.C., London
DOWNS, PETER, M.R.C.S. and L.A.C., Stockport, Cheshire
DYER, WILLIAM GEORGE T., M.R.C.S., London
EAGLAND, WM. H., M.R.C.S., L.A.C., and L.M., Guisboro', Yorkshire
EMANUEL, LEONARD, M.R.C.S., London
EVANS, NICHOLL, M.R.C.S., Stoke Newington
FOREMAN, WILLIAM, Wigan, Lancashire
FOX, LUTHER O., F.R.C.S., L.R.C.P. Ed. and L.A.C., Broughton, Hants
GOLDSMITH, JOHN, M.R.C.S. and L.A.C., Hambledon
GRAVES, FREDERICK G., M.R.C.S. and L.A.C., Southam, Warwickshire
HARRIS, WILLIAM H., M.R.C.S. and L.A.C., H.M.E.I.S.
HEGINBOTHAM, EDMUND, M.R.C.S., L.A.C., and L.M., Calcutta
HEMBROUGH, JOHN, F.R.C.S. and L.A.C., Waltham, Grimsby
HEPWORTH, W. B., M.R.C.S., and L.A.C., Armley, near Leeds, Yorks.
HODGSON, JAMES B., M.R.C.S. and L.A.C., Preston
HURT, SAMUEL, M.R.C.S. and L.A.C., Mansfield
JONES, W. G., M.R.C.S.; L.A.C., and L.M., St. Ann's Dispensary, Liverpool
KITCHENER, THOMAS, London
LAKE, WILLIAM C., M.R.C.S. and L.A.C., Teignmouth, Devon
LEACH, JAMES, M.R.C.S., L.A.C., and L.M., Shaw, near Oldham
LYNES, EDWARD, M.R.C.S., L.A.C., and L.M., Coventry
M'KEEVER, JOHN, M.R.C.S., Guy's Hospital
MORRIS, JOHN P., M.R.C.S. and L.A.C., Lewes, Sussex
MORRIS, WILLIAM, M.R.C.S., London
MURPHY, JOSEPH B., M.R.C.S., R.N., West Ella, Yorkshire
OGDEN, JAMES, M.R.C.P., Manchester
PATTULLO, WILLIAM, L.R.C.S. Ed., Althly, Perthshire
RATTRAY, JOHN, L.R.C.S. Ed., Lanarkshire
RAWDON, HENRY G., M.R.C.S., L.A.C., and L.M., Liverpool
RIDINGS, JAMES S., M.R.C.S., Assistant-Surgeon H.M.I.A.
RIDLEY, JOSEPH S., M.R.C.S., and L.M., Heywood, Lancashire
ROWDON, HENRY M., M.R.C.S., London
SEDGWICK, LEONARD W., M.R.C.S., and L.A.C., Boro'-bridge, Yorkshire
SPENCER, HENRY B., M.R.C.S., and L.A.C., Wantage, Berkshire
TAYLOR, HENRY M., L.A.C., Manchester
THOMAS, JOHN L., M.R.C.S., and L.A.C., Pwllheli, Carnarvonshire
WARD, HENRY D., M.R.C.S., L.A.C., and L.M., Blyth, Northumberland
WHITE, FRANCIS T., M.R.C.S., and L.A.C., Rawth, Essex
WIGLESWORTH, THOMAS, M.R.C.S., and L.M., Blakeney, Gloucestershire

MARISCHAL COLLEGE AND UNIVERSITY.—At the late Graduation Term, Medical Degrees were conferred on the following gentlemen after the usual Examinations, viz., the Degree of M.D. on

HILDITCH, EDWARD
POLSON, JOHN
WADES, JOHN WADE BROWN

and the Degree of M.B. on James Bronislas Jaskowski.

At the same time John Ogilvy, M.B., of this University, was promoted to the Degree of M.D.

APPOINTMENTS.

BYRNE.—J. A. Byrne, Esq., M.B., Trinity College, Dublin, Senior Assistant-Physician to the Rotunda Hospital, Dublin, has been appointed Professor of the Theory and Practice of Midwifery to the Catholic University of Ireland.

MOORE.—William Moore, M.B. M.R.I.A. has been appointed Physician Extraordinary to Sir P. Dun's Hospital, Dublin.

QUINLAN.—Francis B. Quinlan, Esq., M.B. Trinity College, Dublin, Surgeon to St. Vincent's Hospital, Dublin, has been appointed Professor of Materia Medica to the Catholic University of Ireland in the room of the late Dr. Robert MacDermott.

DEATHS.

DUFTON.—October 17, at his house in Temple-street, Birmingham, William Dufton, M.R.C.S., aged 53.

BARBER.—September 15, at his residence in the citadel of Lahore, Dr. James Barber, Senior Surgeon, aged 57.

DOW.—September 28, at Ellington, N.S., suddenly, Horatio Dow, M.D., aged 67.

ELLIOT.—October 18, near Leeds, whither he had gone for the benefit of his health, of typhoid fever, Thomas Elliot, of Carlisle, M.R.C.S. Eng., 1839, aged 42.

EVERIES.—On board the *Eglintown*, while on his passage from Bombay to the Cape, Dr. Everies, R.N.

FERGUSON.—October —, at No. 8, Clinton-street, Brooklyn, New York, John T. Ferguson, Physician.

GILETTE.—Dr. Gilette, Physician to the Hôpital des Enfants, and one of the most distinguished of the Parisian Practitioners, has just died of diphtheritis, after a brief illness. He contracted it from a child suffering from the disease, whom he brought from the country to Paris, being for several hours in the same vehicle with him.

HEIGHWAY.—October 14, Richard Clew Heighway, of Clun, Salop, L.F.P.S. Glasg.; M.D. St. Andrews; L.S.A. Lond.; only son of the late Dr. Heighway, of Storrord.

KIRK.—October 17, at Lower Leeson-street, Dublin, Thomas Kirk, formerly of Shanghai, M.R.C.S.I., aged 54.

MANSSELL.—October 23, Dr. Fitzwilliam Mansell, Deputy Inspector-General, R.N., aged 51.

PALEY.—October 16, at Bishopton Grange, near Ripon, Robert Paley, M.D., University of Glasgow; L.R.C.S., Edin.; a magistrate for the Liberty of Ripon and West Riding of Yorkshire, aged 79.

WYMAN.—October 18, at Kettering, Northamptonshire, suddenly, William Sandeman Wyman, M.R.C.S., Eng.; L.S.A., Lond., aged 53.

THE Sanitary Condition of Windsor is again made the subject of a correspondence between the local authorities and high officials.

M. LANGLAIS affirms that the vesicles of clouds and fogs contain watery vapour in their interior, not air, as is usually supposed.

CHARLATANISM is so rampant in Portugal that the daily journals have begun to call upon the Government to apply to the Charlatans the laws against the illegal practice of Medicine.

THIS present month of October stands remarkable in the annals of temperature. On the 4th inst. the thermometer reached 80°, and on the 24th Mr. Lowe (of Highfield Observatory) informs us that it fell to 22.4 degrees.

A MEDICAL REGISTRATION ASSOCIATION has been established in connection with the Bath and Bristol Branch of the British Medical Association; and we are happy to learn that the same Branch has set on foot an inquiry respecting the cases of Diphtheria which have occurred in the district.

UNIVERSITY OF LONDON.—At a meeting of the Senate held on Wednesday the 19th, the name of Mr. J. Hughlings Jackson was placed on the list of those who had passed the first examination for the Degree of Bachelor of Medicine in the first division, it having been omitted from the first list published after the examination.

A PRESENT TO THE FRANCO-SARDINIAN ARMY.—Dr. Genuari, the director of a Surgical mechanical establishment at Milan, has generously offered to provide artificial limbs for all the soldiers of the Franco-Sardinian Army (up to the rank of sergeants), who have undergone amputation of the leg or thigh during the war for Italian independence.

GUY'S HOSPITAL.—Voluntary Examination at entrance in Classics, Mathematics, and Ancient and Modern History. First and Second Prizes £22 10s. each: W. Murdock, T. D. Welch—equal. Third Prize £15: A. G. P. Wilks. Honorary Certificates (N.B. the following names are arranged alphabetically): J. St. T. Clarke, T. Stevenson, J. Willes, F. Woodman.

PRIZE QUESTIONS.—The Medico-Chirurgical Academy of Ferrara offers the prize of 200 Roman scudi and thirty copies of the essay, to the successful competitor upon the question: "Mental Diseases in Relation to Legal Medicine."

The essays to be written in Latin, Italian, or French, and delivered, post-free, to the Secretary of the Academy by March 31, 1862.

AN ARISTOCRATIC RECIPE FOR THE ITCH.—M. Bourguignon, its inventor, states that the ointment has a pleasant odour, and effects a certain cure after a single friction:—Yolk of eggs, 2; essences of lavender, citron and mint, of each, 5 grammes; essences of canella and clove, of each 8 grammes; gum-dragon, 2 grammes; sulphur, well pounded, 100 grammes; glycerine, 200. Mix well the essences with the yolks, add the gum-dragon; then to the mucilage add very gradually the glycerine and sulphur.

THE PARIS SOCIETY OF SURGERY.—This body has just been recognised officially by the French Government as an "establishment of public utility,"—a proceeding equivalent to that of granting a Royal Charter to one of our own bodies. The Society was founded in 1843 by 17 Hospital Surgeons, having M. Bérard, jun. as its first President. At the present time it consists of 35 titular members; 7 honorary members, among whom are MM. Velpeau and Cloquet; 11 members of the Academy of Medicine; 46 national correspondents, almost all of whom are at the head of the principal civil and military hospitals; 16 foreign associates; and 28 foreign correspondents—making in all 143 members. During the fifteen years of its existence, the Society, in spite of the various events which have occurred, has never suspended its meetings, and has always continued to labour zealously. It has published four and a-half volumes in 4to of valuable Memoirs, and eight volumes in 8vo of "Proceedings." It has also established prizes; and has succeeded in inducing the most illustrious names of modern Surgery to participate in its labours.

HYDROPHOBIA AT TURIN.—At Turin and at Paris every dog ought to be muzzled, according to law, and to bear on his collar the name of his owner. In 1847, at Turin, all hotel and coffee-house and coffee-house keepers, etc., were ordered to place little drinking-troughs before their houses for the benefit of these animals; but this last measure naturally fell into disuse—the municipals having forgotten that dogs lap their drink, and therefore, as muzzled dogs, could derive no use from the troughs. In 1854 a tax of about 15 francs was put on each dog, excepting the dog of the blind, of house-guard dogs in the country, and the dog who only remained fifteen days in the city. On each dog also was to be affixed a metal ticket, delivered by the police, signifying that his tax had been duly paid. All dogs without muzzle, collar, or ticket, are at once *sequestered*, and destroyed if not reclaimed, or if they present any premonitory, or positive signs of hydrophobia. Some of the Academicians of Turin attribute hydrophobia in dogs to their forced habits of continence, and therefore recommend municipalities to reduce the tax on female dogs.

METEOROLOGY.

From Observations at the Greenwich Observatory.

Mean height of barometer	29.490 in.
Mean temperature	48.3
Highest point of thermometer	64.5
Lowest point of thermometer	28.0
Mean dew-point temperature	45.0
General direction of wind	S.W.
Whole amount of rain in the week	0.53
Amount of horizontal movement of air in the week	475 miles.

VITAL STATISTICS OF LONDON.

Week ending Saturday, October 22, 1859.

BIRTHS.

Births of Boys, 872; Girls, 918; Total, 1790.
Average of 10 corresponding weeks, 1849-58, 1533.3.

DEATHS.

	Males.	Females.	Total.
Deaths during the week	459	451	910
Average of the ten years 1849-58	516.3	515.5	1031.8
Average corrected to increased population
Deaths of people above 90
Deaths in 15 General Hospitals	17	14	31

DEATHS IN SUB-DISTRICTS FROM EPIDEMICS.

TO CORRESPONDENTS.

The proof of Dr. Cuthbert's Paper on the Prominent Features of the Ulster Revival has not been received.

Obs.—Another triple birth is announced as having occurred last week at Portsea.

O.A.—The Chinese reckon twenty-four varieties of the pulse, each variety of course, aiding prognosis and diagnosis.

D.W.—The charge for pauper lunatics has been lately increased at Colney Hatch Asylum, from 9s. 11d. to 10s. 6d. per week.

Les Huguenots.—The Act is very plain. Any one falsely assuming a Medical title incurs a penalty, and Certificates are only received from registered Practitioners.

B. Thornbury.—According to the statement received, A has acted very improperly. We think he is bound to submit the matter to the arbitration of mutual friends.

S.S.—Upwards of £53,000,000 are spent yearly by the working classes alone of this country, on spirits, beer, and tobacco! This we give on the authority of "Social Science."

A. Med.—It has been decided to erect at Woolwich a New General Military Hospital, near Dundas-terrace, the Army Sanitary Commissioner being of opinion that the present Royal Ordnance Hospital is unfit for the purposes for which it was intended.

M.D.—Garrick said of Sir John Hill, the Physician and Author: "The worse I wish the Doctor is that he may be compelled to take his own physic and read his own verses." "You must reverse the punishment," said a wag, "any man who takes the Doctor's physic won't live to read his rhymes."

Psyche.—If the late researches of M.M. Poissuille and Gobley are correctly interpreted by them, it results: that the whole of the urea which is brought to the kidneys by the arterial blood is not thrown off from it, but that the greater part of it enters again into the circulation; and that this principle arises and is transformed at different points of the organism, and is, therefore, not a mere excrementitious substance.

Oxon.—"Learned Grecians" are to be found amongst our French brethren. Dr. Petrequin, ex-Chirurgien in Chief of the Hôtel Dieu of Lyons, is at this moment engaged in a profound study of the Surgery of Hippocrates. M. Damont, Professor of Medicine at Angers, often shows his philological powers and knowledge of Greek literature in the journals; a few years ago he wrote a letter in Greek to M. Villemain, in capital style. D. Girard, of Rouen, also indulges his leisure hours in the study of Greek literature. And Dr. Prosper Yvaren has just published a translation of the Odes of Anacreon in French verse.

Dr. Barker and Mr. Chavasse.—Mr. Chavasse has sent us some further instances of appropriation, and a copy of a letter from Dr. Barker: but as we stated last week, we cannot afford space for a further continuance of this discussion. We feel bound, however, to insert the following Protest from the Medical men of Birmingham against Dr. T. Herbert Barker, for his conduct towards Mr. Pye H. Chavasse.

"We, the undersigned Medical men of Birmingham, hereby enter our protest against Dr. T. Herbert Barker, of Bedford, for his conduct towards Mr. Pye H. Chavasse in extracting numerous passages from Mr. Pye H. Chavasse's 'Advice to a Mother,' and appropriating the same in his (Dr. Barker's) 'Hygienic Management of Infants and Children,' without due acknowledgment to Mr. Chavasse.

"We are also of opinion that Dr. Barker has offered an insult to Mr. Chavasse, and to the Medical Profession of Birmingham, in a letter addressed by him to Mr. Chavasse, Oct. 1, 1859.

ALFRED BAKER, F.R.C.S., Surgeon to the Birmingham General Hospital.
JOHN BASSETT, M.R.C.S. Eng., Lecturer on Materia Medica at Sydenham College, Birmingham.

SAMUEL BERRY, Professor of Midwifery, Queen's College, Birmingham.
S. A. BRADLEY, F.R.C.S. Eng.

V. W. BLAKE, F.R.C.S., Surgeon, Lying-in Hospital, Birmingham; Lecturer on Midwifery at Sydenham College.

FRANCIS T. BOND, M.B., Physician to Queen's Hospital; Dean of the Faculty, and Professor of Chemistry in Queen's College.

DAVID BOLTON, F.R.C.S., Surgeon to the Birmingham General Hospital; late Professor of Anatomy, Queen's College.

CHARLES BRACEY, M.R.C.S.

SAMUEL WINTER BURBURY, M.D., M.R.C.S.

SAMUEL CHAVASSE, M.R.C.S.L.

THOMAS CHAVASSE, F.R.C.S.L.

M. H. CLAYTON, M.R.C.S.

DICKINSON W. CROMPTON, Senior Surgeon, General Hospital, Birmingham.

JOHN BIRT DAVIES, M.D., Coroner of Birmingham.

REDFERN DAVIES, M.R.C.S., Surgeon to the Birmingham Workhouse Infirmary.

GEORGE F. EVANS, M.D., F.R.C.P.L., Physician to the General Hospital, Birmingham.

RICHARD FARNCOMBE, M.R.C.S.

ALEXANDER FLEMING, M.D., L.R.C.P., Senior Physician to the Queen's Hospital, Birmingham.

BELL FLETCHER, M.D., Physician to the General Hospital, Birmingham.

WALTER CARLESS FREER, M.R.C.S., late Surgeon to the Dispensary, Birmingham.

W. PRESTON GOODALL, House-Surgeon to Birmingham General Hospital.

JOHN JOSEPH HADLEY, M.R.C.S., L.S.A.

JAMES HARMAR, M.R.C.S., late Senior Surgeon to Birmingham General Dispensary.

THOMAS P. HESLOP, M.D., L.R.C.P., Physician to the General Dispensary.

WALTER JAUNCEY, L.R.C.S., Ed., Fellow of the Geological Society.

DAVID JOHNSON, M.R.C.S., L.S.A., Lecturer on Anatomy in Sydenham College.

J. JOHNSTONE, M.D., F.R.C.P.L., Senior Physician to the General Hospital, Birmingham.

GEORGE JONES, M.R.C.S., L.M.

T. FURNEAUX JORDAN, Professor of Anatomy, Queen's College, and Assistant-Surgeon to the Queen's Hospital, Birmingham.

JOHN WHITE KEYWORTH, M.D., Lecturer on Physiology in Sydenham College, Birmingham.

G. H. MARSHALL, M.D., F.R.C.S.

JAMES L. MAXWELL, M.D., House-Physician to Birmingham General Hospital.

WILLIAM C. ORFORD, M.R.C.S., L.S.A., Hon. Medical Officer to the Birmingham and Midland Counties Lying-in Hospital and Dispensary; Lecturer on Forensic Medicine at Sydenham College.

LANGSTON PARKER, Surgeon to the Queen's Hospital, etc.

OLIVER PEMBERTON, Surgeon to the Birmingham General Hospital.

JAMES RUSSELL, M.D., Physician to the Birmingham General Hospital.

JAMES VOSE SOLOMON, F.R.C.S., Surgeon to the Birmingham Eye Institution.

SAMUEL SPATLY, M.R.C.S., L.M., L.S.A., Senior Resident Surgeon to the Birmingham General Dispensary.

THOMAS SWAIN, L.S.A.

WILLIAM TARLETON, F.R.C.S. England.

THOMAS TAYLOR, M.R.C.S.

RICHARD THOMASON, Surgeon to the Birmingham General Dispensary.

CHARLES TOWNSEND, M.R.C.S. England, Surgeon to the Birmingham and Midland Counties Eye Institution.

W. F. WADE, M.B., Physician to the General Dispensary, Professor of the Practice of Medicine in Queen's College.

AUGUSTUS WALLER, M.D., F.R.S., Member of the Royal College of Physicians, London; Physician to the Queen's Hospital; Professor of Physiology, Queen's College.

JAMES F. WEST, Surgeon to the Queen's Hospital, Birmingham.

THOMAS WATKIN WILLIAMS, M.R.C.S. Eng., and L.S.A.

GEORGE YATES, M.R.C.S., Senior Surgeon to the Birmingham General Dispensary.

THE BREANT PRIZE.

We are requested to state that the *Dr. Pickering* mentioned in the last letter of our French correspondent, is *Mr. Arthur Pickering, Printer and Stationer*, of York.

INTRA-UTERINE AMPUTATION.

TO THE EDITOR OF THE MEDICAL TIMES AND GAZETTE.
SIR,—Thinking it well to place on record an extraordinary case of arrest of development in the fetus, I have sent you the particulars, the mother and child being still under my care. I am, &c.

W. R. F. LANE, M.R.C.S. and L.S.A.

2, Bethnal-green, Oct. 20, 1859.

Oct. 13. — Mrs. C., of Temple-street, Hackney-road, gave birth to a daughter without forearms, hands, and legs, giving the appearance of having been amputated at the elbow-joints, and the left leg above the knee—there is a short prolongation from the right knee, about two inches in length, with a small foot and one toe. The child is otherwise well formed and likely to live. The mother says her sympathy was much excited in the early period of pregnancy by the sight of some cripples, soliciting alms, whose arms had been amputated, and were also deformed.

THE TITLE OF DOCTOR.

TO THE EDITOR OF THE MEDICAL TIMES AND GAZETTE.
SIR,—I beg leave to make a remark on the communication of your correspondent, J. E. Smyth, B.A. and L.R.C.P.E., in your last number. This gentleman appears to think that although a man cannot be registered as a Doctor of Medicine under the late Act who is not *bona fide* such by graduation; he may still call himself Doctor, and be called so by others, who like to do so, on the ground of his possessing the Edinburgh Licentiate. All this I grant,—the Army Surgeon is called Doctor in his regiment, the Navy Surgeon in his ship, the Country Surgeon in his practice; but this is a matter of courtesy, and also useful on many occasions to distinguish one individual from another. Any man may, doubtless, call himself Doctor, or be called Doctor; but let me ask, if a Medical man sets up this cognomen for himself, are we not to understand by it that he means he is a Doctor of Medicine, and wishes to be classed with men holding, legitimately, that title?—and if not, I cannot look upon the assumption as other than empirical.

I am, &c. THOMAS STOKES.

Nailsworth.

THE NAVAL MEDICAL SERVICE.

TO THE EDITOR OF THE MEDICAL TIMES AND GAZETTE.
SIR,—I beg to corroborate in every particular the statements of your correspondent "R. N." respecting the want of faith shown by the present Admiralty, in the carrying out the provisions of the "Naval Medical Warrant." I would earnestly caution Students not to be deluded by what appears on paper, but to believe in the *facts* stated by your Correspondent, and to pause before they enter the Service,—the governing body of which has recourse to every petty low subterfuge, to evade the fulfilment of what is now the law of the land, as laid down by Her Majesty in Council, and is at best but simple justice.

I have reason to know that the widow in question is about to appeal to the legal tribunals of the country, for that amount of pension which their Lordships of the Admiralty so unjustly withhold, and at the forthcoming Parliament, I feel certain that the noble-minded Sir John Pakington, and our many friends in the House of Commons, will not fail to represent the mean, unjust and impolitic conduct of the present Board of Admiralty; and I trust that you, Sir, in your editorial capacity, will, as you have always done, state the facts as they really are, to the Medical Students, and not allow them to enter the Service under the impression that the provisions of Her Majesty's Warrant of May last are carried out.

I am, &c.

Dublin, October 28th.

SURGEON, R.N.

ABERNETHY AND LEA.

TO THE EDITOR OF THE MEDICAL TIMES AND GAZETTE.

SIR,—Mr. G. Lea confers a boon upon the gentry and commonalty of North Lancashire, Westmoreland and Yorkshire by inserting the subjoined modest paragraph, week after week, in one of the most highly respectable newspapers published at Lancaster. It is to be regretted that the Medical Council cannot adopt means to become familiar with the effectual and speedy yet secret cure so unfortunate for the name of Mr. Abernethy, so fortunate for Mr. G. Lea.

I am, &c.

SALUS POPULI.

“THE LATE MR. ABERNETHY.—The great skill and experience of this eminent Medical practitioner, and his unremitting exertions to relieve suffering humanity, are proverbial throughout the world; the public, however, are not generally aware, that in the course of his useful life, he discovered an effectual and speedy cure for whooping cough, that distressing and destructive malady which few children ever escape. Fortunately for the rising generation, the secret did not die with him, and it is therefore by no means surprising that the medicine prepared from this invaluable recipe, should be in such good request. It may be obtained, etc. etc.”

VACCINATION.

TO THE EDITOR OF THE MEDICAL TIMES AND GAZETTE.

SIR,—I must again trouble you to insert a few remarks on Mr. Griffin's letter of the 22nd inst.

Mr. Griffin regrets that I have not made the return as by law appointed, to the Registrar, and couples it with his testimony as to my worthiness, for which I feel truly obliged. I am sorry to say that I am case-hardened enough not to regret my non-compliance with the law. I have frankly avowed my delinquency, and am ready to take the consequences. I do not, as Coleridge did, hate “a *cui bono* man,” being indeed one of the genus, I only wish our legislators, amateurs as well as professional, belonged to the same class.

It may be well for you to know what a public vaccinator is expected to do for (let us take Mr. Griffin's scale) 2s. 6d. per case for the first hundred cases and all the pretty gradations down that scale.

1st. He must give a certificate to the parent or guardian of the child and keep a duplicate of the same. 2nd. He must send a certificate to the registrar and keep a duplicate of the same. 3rd. He must make a monthly return to the Board of Guardians of the number vaccinated, with the parish and expense annexed. 4th. He must make a quarterly return to the Board of Guardians, with the number of cases, their individual expense, and sex. Last of all (everything, even red tape, must have an end), the Privy Council require, through the Board of Guardians, a yearly return of successful and unsuccessful cases, tabulated as to age. Mr. Griffin would, in addition, make it our duty, on receiving a notice from the Registrar, to call on recalcitrant parents,—if it involve a breach of Professional etiquette no matter, and in case bullying or soothing should not avail, to report the same to the registrar (who might withhold our half-crowns) as worthy of condign punishment.

At the risk of occupying too much of your valuable space, I must proceed to show how entirely my plan meets the present difficulty, and how, instead of bringing in a new Act, the 32nd clause of which I am now suffering from, we only require a slight amendment of that now existing. It is evident that there are three parties concerned in the matter. 1st. The State, whose business it is to take care of the health of the general body politic, and, if possible, to ward off disease. 2nd. The parent, whose duty it is to preserve the health of the child. 3rd. The Medical man whose business and interest it is to perform a certain operation, give one certificate to the parent as to its having been efficiently performed, and receive his pay. The State, represented by the registrar, has a simple routine to perform, viz. on birth registration to inform the parent of his duty, and upon the non-performance of that duty to enforce it as the law directs. The parent must come to regard the registrar as very similar to those unpleasant people called tax-collectors, and bow to a disagreeable but inevitable necessity, whilst the Medical man will be called upon to do what he knows how to do, and what will not entail any self-degradation.

I am sorry to be obliged to intrude my own personal matters into this communication, but as I sympathise with Mr. Griffin's sorrow at my not having made any returns to the Registrar, I feel I shall be relieving his mind by informing him that only two deaths from small-pox have occurred in my district, containing nearly 5000 inhabitants, during the last ten years. If he find any more satisfactory statistics in the Registrar General's returns I shall be surprised.

In conclusion I must say that the law which requires Medical men, as a part of their duty, to pry into the affairs and houses of other men's patients, necessarily disqualifies every gentleman from being a public vaccinator.

I am, &c.

Great Ilford.

E. W. SULLIVAN, M.D.

“THE MIXTURE TO BE TAKEN AS BEFORE.”

TO THE EDITOR OF THE MEDICAL TIMES AND GAZETTE.

SIR,—If the mere prevalence of a custom could be considered any proof of its excellence, then might the practice of labelling as above be pronounced quite unobjectionable; for it is one which is adopted by every Druggist who makes up prescriptions, as well as in the surgery of every Medical Practitioner who sends out his own medicines. But the very universality of a bad practice renders it more highly objectionable, and affords a stronger argument for its disuse.

I will presently show that this mode of labelling is open to grave objection, because it may lead to much perplexity and risk, if not to positive mistakes.

We will suppose a case, which will illustrate my meaning:—

A family of children are under Medical care for one or other of those numerous infantile disorders, viz., scarlet fever, measles, or something of a similar description. As children under the same roof are generally attacked one after the other by any prevailing illness, they will each be in a different condition, and each will require distinct treatment, to suit the peculiar symptoms belonging to the particular stage of the disorder present in each case.

Now, imagine the various medicines when requiring to be repeated, all coming labelled “To be taken as before.” What a stretch of memory would be necessary to recollect the precise directions for each, viz., which the “quarter part every six hours,” or the “table-spoonful night and morning,” the “tea-spoonful three or four times a-day,” or “the draught to be taken at bed-time.”

It may be thought that no harm could happen if a little more of any medicine were to be given than the precise quantity ordered. But that is a great mistake. It must be remembered that some of the most deadly poisons form an ingredient in many medicines—prussic acid for instance—and although these are prescribed in very minute quantities, a double dose, administered four times a-day, instead of the smaller portion once or twice, might produce serious mischief. Again,—laudatum and other opiates are often given as sedatives in cough-mixtures, over-doses of which would change them into deadly narcotics. In the lying-in room, also, mistakes are likely to occur; monthly nurses in general, from their age and want of mental culture, have very bad memories, and it is not an uncommon occurrence for the old nurse to say to her patient, upon a fresh arrival of medicine, *as before*. “Please, mum, can you tell whether you was to take most of the pink mixture or the yaller?” and the lady being either unable or unwilling to give an opinion, the medicine most probably is taken at a guess, or not taken at all, the latter certainly the more prudent course under the circumstances. I have named this subject to two or three Medical men, who have been struck with the probability of such a perplexing position as related above, and more than one of them determined at once upon giving orders to their assistants in the Surgery to destroy all labels bearing the inscription “To be taken as before,” saying that in future every medicine, when repeated, should have its full directions upon it. I hope many who see these suggestions will follow so good an example as the foregoing.

There is so much carelessness in general by nurses and attendants on the sick in administering medicine, that it is the more necessary, in order to throw some protection around the patient, for medicines to be dispensed and labelled with more circumspection than heretofore.

I am, &c.

MATER.

COMMUNICATIONS have been received from:—

PROFESSOR SIMPSON; DR. WEST; DR. G. JOHNSON; DR. OGILVIE, Aberdeen; DR. MILROY; DR. DAY, St. Andrews; DR. G. HEWITT; DR. MEADOWS; MR. WAITE; DR. BARNES; DR. J. BIRD; DR. DYSTON; DR. GIBB; DR. TRIBE; MR. STOKES; DR. DEVENISH; MR. HOPLEY; MR. SULLIVAN; MR. MILNE; MR. LEMON; MR. WALLER; MR. PITT; MR. CLARKE; MR. BERNARD; REGISTRAR-GENERAL; MR. LEONARD; MR. FOSTER; MR. PARKS; MR. EVANS; MR. STOCKER; MR. HAY; DR. STEWART; MR. BROWNING; MR. HAMILTON; MESSRS. LEGGATT, HAYWARD, and LEGGATT; MR. IRVINE; MR. LONG; DR. WILLIAMSON, Aberdeen; MR. ROBERTS.

APPOINTMENTS FOR THE WEEK.

October 29. *Saturday (this day).*

Operations at St. Bartholomew's, 1½ p.m.; St. Thomas's, 1 p.m. King's, 2 p.m.; Charing-Cross, 1 p.m.

31. *Monday.*

Operations at the Royal Free Hospital, 1 p.m.; Metropolitan Free Hospital, 2 p.m.

MEDICAL SOCIETY OF LONDON, 8½ p.m. J. Bishop, Esq. F.R.S., “On the Strength, Flexibility, and Curvatures of the Vertebral Column.”

November 1. *Tuesday.*

Operations at Guy's, 1 p.m.; Westminster, 2 p.m.

PATHOLOGICAL SOCIETY, 8 p.m.

2. *Wednesday.*

Operations at University College Hospital, 2 p.m.; St. Mary's, 1 p.m. Orthopaedic Hospital, 2 p.m.; Middlesex, 1 p.m.

HUNTERIAN SOCIETY, 8 p.m. (Council Meeting, 7½ p.m.) Mr. N. Ward “On Cases of Injury to the Head.”

OBSTETRICAL SOCIETY OF LONDON, 8 p.m. Mr. Dunn “On the Statistics of Midwifery, from Private Practice.”

3. *Thursday.*

Operations at St. George's, 1 p.m.; Central London Ophthalmic, 1 p.m.; London, 1½ p.m.; Great Northern, 2½ p.m.

HARVEIAN SOCIETY OF LONDON, 8 p.m. (Council Meeting, 7½.) Dr. C. T. Coote “On Intercostal Neuralgia.”

4. *Friday.*

Operations, Westminster Ophthalmic, 1½ p.m.

WESTERN MEDICAL AND SURGICAL SOCIETY OF LONDON, 8 p.m. (Council Meeting at 7.) Dr. Fuller “On Treatment of Renal Anasarca.”

EXPECTED OPERATIONS.

King's College Hospital.—The following Operations will be performed this day (Saturday):—

Mr. Fergusson.—Encysted Tumour; Necrosis of Humerus; Stricture of Urethra. Mr. Wood.—Ligature of Nævus.

Westminster Hospital.—The following operations will take place on Tuesday next, at 2 o'clock:—

Mr. Holt.—Stricture of the Urethra. Mr. Hillman.—Removal of Diseased Breast.

Struve's Seltzer, Marienbad, Vichy,

KISSINGEN, and other MINERAL WATERS.—Under her Majesty's especial Patronage.—ROYAL GERMAN SPA, BRIGHTON, STRUVE'S PUMP-ROOM and PROMENADES, offering every facility for a Course of Mineral Waters, as perfect and beneficial as at the natural springs, are NOW OPEN, for the Thirty-fifth Season. A prospectus, with the highest Medical testimonials, may be obtained gratis, at the Pump-room, or from George Waugh and Co. Chemists to the Queen, 177, Regent-street (west side), London, and other respectable houses in London and the provincial towns, where orders for Struve's Bottled Mineral Waters continue to be executed.

CAUTION.—The success obtained by Struve's Mineral Waters, owing to their perfect identity with those of the natural springs, has induced several parties to attempt imitations, sold as "Brighton Seltzer," "Brighton Vichy," &c., an analysis of some of which has shown an utter disregard of their true chemical composition. To distinguish Struve's Waters from all others, every bottle has a label and red ink stamp over the cork, each bearing Struve's name, without which name none is genuine, though contained in Struve's old bottles.

Williams and Son's Pure Glycerine

SOAP. Analysed by Dr. Hofmann, F.R.S., and Professor Redwood, Ph.D., strongly recommended by many eminent members of the Medical Profession, and favourably noticed by the following Medical Journals:—

THE LANCET.
THE MEDICAL TIMES AND GAZETTE.
THE BRITISH MEDICAL JOURNAL.
THE MEDICAL CIRCULAR.
EDINBURGH MEDICAL JOURNAL.
THE DUBLIN HOSPITAL GAZETTE.

It is suited to all cases of delicate skin (whether arising from disease or otherwise), and is admirably adapted for nursery use. May be had of all respectable Chemists, Perfumers, &c.

SOAP-WORKS, CLERKENWELL, LONDON, E.C.

Crosse and Blackwell, Purveyors in

Ordinary to Her Majesty, respectfully invite attention to their PICKLES, Sauces, Tart Fruits, and other table delicacies, the whole of which are prepared with the most scrupulous attention to wholesomeness and purity. The practice of colouring pickles and tart-fruits by artificial means has been discontinued, and the whole of their manufactures are so prepared that they are not allowed to come in contact with any deleterious ingredient. A few of the articles most highly recommended are, Pickles and Tart Fruits of every description, Royal Table Sauce, Essence of Shrimps, Soho Sauce, Essence of Anchovies, Jams, Jellies, Orange Marmalade, Anchovy and Bloater Pastes, Strasbourg and other Potted Meats, and Calf's-Foot Jellies of various kinds for table use. C. and B. are also sole agents for M. Soyer's Sauces, Relish, and Aromatic Mustard; and for Carstairs' Sir Robert Peel's Sauce, and Payne's Royal Osborne Sauce. The above may be obtained of most respectable Sauce Vendors throughout the United Kingdom; and Wholesale of

CROSSE and BLACKWELL, 21, Soho-square.

Great Reduction in the Prices of New

MEDICAL GLASS BOTTLES and PHIALS, at the Islington Glass Bottle Works, Islington-place, Park-road, London Warehouses, 19, Broad-street-hill, near Thames-street, City, E.C., and 2, Upper Copenhagen-street, Barnsbury-road, Islington. E. and H. HARRIS and CO. Proprietors.

"PULVIS JACOBI VER., NEWBERRY'S."

Diphtheria, Fevers, Hooping Cough,

&c.—We beg to caution the Profession against imitations of this invaluable Medicine, for so many years prescribed as "Pulvis Jacobi Ver." but to which it is now necessary to add the name "NEWBERRY'S," to secure prescribers against the SUBSTITUTION of articles advertised as James' Powder, BUT WHICH HAVE NOTHING IN CHARACTER, DOSE, OR EFFECT, with the original article, which has been sold by the Newbery Family continuously since its introduction in 1746.

Price, for dispensing: 1 oz. bottles, 9s.; 1/2 oz. do. 3s. 4d.

45, St. Paul's-churchyard, London. (Signed) F. NEWBERRY & SON.

Carriages, New and Second-hand, of

superior style, sterling quality, and finest finish at reasonable rates, for cash, credit, job, or exchange. Circular of prices on application. Credit given when required. Buyers should take carriages on trial, with power to purchase by yearly payments, and thus prove them.

OFFORD'S PATENT MEDICAL MAN'S BROUGHAM MANUFACTORY, 79, WELLS-STREET, OXFORD-STREET.

Health, Fresh Air, and Pure Water.

—By Her Majesty's Letters Patent.—CONDY'S FLUID contains NASCENT OXYGEN, nature's true and only purifying agent; instantly removes all offensive smells; renders impure water fresh, and the air pure; when diluted for use, is of a beautiful colour, not soiling the finest linen; is harmless, and particularly adapted for toilet use, being both refreshing and exhilarating. The Medical Profession have expressed their unqualified approbation of its merits. One gallon makes 200 gallons adapted for use. The cooling, healing, gently stimulating and invigorating properties of this Fluid render it, when diluted, a lotion possessing peculiar and valuable characteristics, whether for bathing the bodies of invalids, incorporating in poultices, or washing and healing wounds. Patronised by the Board of Health, and most public departments, hospitals, schools, and adopted by the India Council in preference to all other disinfectants. In bottles, 6d. 1s. and 2s.; stronger and purer, 1s. 2s. and 4s.

CONDY'S PATENT HEALTH POWDER also contains NASCENT OXYGEN, is odourless, and destroys all smells; in bottles, 1s. 6d. and 3s., and in casks of 1 cwt. 36s.—Wholesale agents, John Bell and Co. Chemists, No. 338, Oxford-st. W.; Butler and Crisp, 5, Cheap-side, St. Paul's; Ferris and Co., Bristol.—Chemical Works, Battersea, S.W.

S. Bowles, late Windsor & Co., Phial

and BOTTLE MERCHANTS, Dealers in Druggists' Sundries, &c., 6, James-street, Covent-garden, W.C. The cheapest house in London for every description of Medical Glass of the best quality.

Samples and Prices forwarded free on application.

H. Silverlock's Medical Label Ware-

HOUSE, Letter-Press, Copper-plate, and Lithographic Printing Offices, Wardrobe-terrace, Doctors'-commons, London, E.C.

H. SILVERLOCK'S stock of Labels for Dispensing purposes having been recently revised and enlarged, now consists of upwards of 800 different kinds. Yellow and Green Labels for Drug Bottles, Drawers, &c., at per book or dozen: a Book, containing a selection in general use in Surgeries or Dispensaries, 10s. 6d. Priced Catalogues of the above may be had, post free, on application. Printing of every Description at Moderate Prices.

Pepsine.—M. Boudault begs to state

that he cannot be answerable for the purity and strength of any Preparation sold under his name unless obtained from his sole Agent, Mr. PETER SQUIRE, Her Majesty's Chemist, 277, Oxford-street, London, to whom all applications respecting it must be addressed.

Second Edition of Boudault on "Pepsine," with Remarks by English Physicians. Edited by W. S. SQUIRE, Ph.D., published by J. Churchill, London, may be also had of the Author, 277, Oxford-street, price Sixpence.

Superphosphate of Iron and Super-

PHOSPHATE OF IRON and LIME. New Remedial Agents introduced to the notice of the Profession at the Meetings of the Medical Society of London, and now extensively employed by the most eminent members of the Medical Profession. The Syrup is the most eligible mode of administering these valuable Remedial Agents. Mr. GREENISH will be happy to forward a variety of cases which have been furnished to him, where its success has been most marked, and which will serve to indicate where it may be most advantageously employed.—20, New-street, Dorset-square.

PURE SPIRITS FOR THE FACULTY.

S. V. R. 56 o.p., 16s. 6d. net Cash.—

This quotation admits of neither credit nor discount, and 1s. per gallon must be added for packages, to be allowed on their return.

HENRY BRETT and CO., Old Fumival's Distillery, Holborn.

Microscopic Glass.—Thin Glass for

Mounting Objects, in squares or circles. Slides 3 in. by 1 in., and Cells of every kind, supplied Wholesale and Retail, by CLAUDET and HOUGHTON, 89, High Holborn, London.

The London School of Dental Surgery,

32, SOHO-SQUARE.

This School has been organised in conformity with the requirements of the Charter granted to the Royal College of Surgeons of England, empowering that Corporation to conduct Examinations, and to grant Diplomas of Proficiency in Dental Surgery.

The Lectures upon the subjects specially pertaining to Dental Surgery will be given during the Summer Medical Session, in order that Students may be at liberty to attend at any of the existing Medical Schools those Lectures enjoined by the Curriculum upon subjects which are not peculiar to Dental Surgery.

The Hospital is now open for the reception of Students, who will receive instruction daily under the superintendence of the Dental Officers.

DENTAL HOSPITAL ATTENDANCE.

9 a.m.—Monday—Mr. W. A. Harrison, F.R.C.S.
9 a.m.—Tuesday—Mr. Samuel Cartwright, jun., M.R.C.S.
9 a.m.—Wednesday—Mr. John Tomes, F.R.S., M.R.C.S.
9 a.m.—Thursday—Mr. Thomas Underwood.
9 a.m.—Friday—Mr. Charles Rogers.
9 a.m.—Saturday—Mr. Robert Hepburn.

Fee for Two Years' attendance, £15 15s.

The following are the Special Lectures:—

Dental Anatomy and Physiology (Human and Comparative)—(G. A. Ibbotson, Esq., F.R.C.S., F.G.S.).
Dental Surgery and Pathology—Mr. Samuel Cartwright, jun., M.R.C.S.
Mechanical Dentistry, with Practical Illustrations—Mr. Robert Hepburn.
Metallurgy—Mr. G. Makins, M.R.C.S., F.C.S.
General Fee—Two Courses on Dental Anatomy, Dental Surgery, Mechanical Dentistry, and one Course in Metallurgy, £15 15s.
Further particulars may be obtained by application to the Dental Officer of the day, or to the Assistant-Secretary of the Dental Hospital 32, Soho-square.

Mental Disorders.—Wye House,

BUXTON, DERBYSHIRE.—PRIVATE ESTABLISHMENT for the Care and Treatment of a select and limited number of persons Mentally affected.

Resident Proprietor—T. DICKSON, L.R.S.C.E.,

Late Medical Superintendent of the Manchester Lunatic Hospital.

Wye House is delightfully situated in its own grounds of twelve acres at Buxton, and forms part of the magnificent scenery of Wye Dale. The well-known salubrity of Buxton, and the hygienic effects of its waters and baths, renders it a desirable locality for Invalids Nervously or Mentally affected. Ample means are provided for the occupation and amusement of the Patients, including carriage and garden exercise.

Private Establishment for the Insane,

CHURCH STRETTON, near SHREWSBURY. This Establishment is conducted by the Resident Proprietor, Dr. S. G. BAKEWELL, Son of the late Mr. Bakewell, of Spring Vale, Staffordshire.

The Ladies occupy a separate residence, and are under the immediate care of Mrs. Bakewell.

The neighbourhood of Church Stretton is very picturesque and healthy. Its similarity to Malvern is often noticed.

A Carriage is kept for the use of the Inmates.

References can be given to Medical Gentlemen and others in Shrewsbury, Birmingham, Hereford, and throughout Staffordshire.

Church Stretton is a first-class Station on the Shrewsbury and Hereford Railway, twelve miles from Shrewsbury.

INDIA RISK ASSURANCES.

Family Endowment Life Assurance

AND ANNUITY SOCIETY.

Established 1835, empowered by Special Act of Parliament. Head Office, 42, New Bridge-street, London, E.C., with Branches and Agents at Calcutta, Madras, Bombay, Agra, and Hongkong, as well as throughout the United Kingdom.

Subscribed Capital, Half-a-Million. Annual Income, upwards of £50,000. Accumulated Invested Fund, £200,000.

This Society transacts every description of Assurance business, and offers to Insurers great facilities and advantages, combined with perfect security.

Eighty per cent. of the profits belong to the assured.

Parties about to proceed to India may effect insurances on highly favourable terms, and are invited to examine the Society's general and special advantages, as set forth in the prospectus of the Indian Branch.

Active Agents are required in all districts not efficiently represented, to whom liberal commissions will be allowed, and at the death of an agent one-half of the ordinary renewal commissions of the agency will (under a fixed condition), be continued to his widow or other nominee during life.

Medical men introducing business to the Society are allowed the same Commissions as are allowed to Solicitors.

Applications for agencies, prospectuses, and further information may be addressed to

EDWIN H. GALSWORTHY, Actuary and Secretary.

Bass's East India Pale Ale.—The

OCTOBER BREWINGS of this Celebrated Ale, and the MILD BURTON ALES are now arriving in casks of eighteen gallons and upwards. Our stock of Ale in bottle is in good condition. Barclay's Porter and Stouts, in bottle and cask, may also be had of BERRY, BROS. and CO. 3, St. James's-street, London.

To Students and others.—You will do

well to inspect the NEW STOCK of Messrs. MILLIKIN and LAWLEY, 161, Strand, adjoining King's College, where the best and most modern INSTRUMENTS may be had at very reasonable charges. Trusses, Crutches, Splints, Legs, and all kinds of Surgical Appliances, made to order with precision and despatch.

Those who cannot swallow Cod-Liver

OIL in its crude state should try NEWBERRY'S COD-LIVER OIL CAKES.—“The gingerbread is extremely light and pleasant, the flavour of the oil being completely covered.”—Medical Times, Feb. 12th, 1869. Packets, 1s. 9d. and 3s. F. NEWBERRY and SONS (Proprietors of the “PULVIS JACOBI VER, NEWBERRY'S,”) 45, St. Paul's Churchyard, London. ESTABLISHED A. D. 1746.

Human Osteology from France,

RAGINEL, 38, Ludgate-hill, City, E.C., London. Patronised by the Royal College of Surgeons of England. Illustrated Osteology on the bones themselves. Very large Stock on the lowest possible terms. Disarticulated Skulls, in twenty-two pieces, in box. All the bones of the disarticulated skulls will be fitted in right order in the presence of the purchaser so as to shew that every bone of each set belongs to the same Skull; it will be the same for all other disarticulated pieces. Skulls with Sections. Hands and Feet on catgut. Disarticulated Skeletons, quite complete, with the Skull same body. Articulated Male Skeletons, the bones very well marked.

STUDENTS CASE OF OSTEOLOGY, COMPLETE.

Splendid Pieces for Lecturers and Museums.

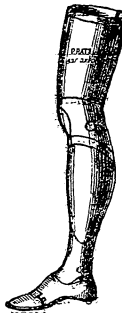

Professors of Anatomy and

STUDENTS

are invited to inspect the Stock of Skeletons, Skulls, separated and entire—Vertebrae, Hands and Feet on catgut, and various loose bones, which are well prepared, perfectly white, and free from grease or smell. The selection of this stock having been made by a good Anatomist, W. M. can confidently recommend them as being well marked, perfect bones, at low prices.

W. MATTHEWS, 8, Portugal-street, Lincoln's-inn-fields, London.

Pratt's Artificial Leg.

J. PRATT begs to call the attention of the Profession to the following Testimonial, just received:—

“Somerset,

June 20th, 1858.

“DEAR SIR,—It affords me much pleasure in being able to state that the Artificial Leg which you supplied me with is far beyond my best anticipations. From its being so LIGHT in weight, and its action in the foot so natural, I can walk, or ride on horseback, with ease and comfort; and few indeed would detect it as being other than natural. It has given me full satisfaction.

I am, dear Sir, yours very truly,

J. W.

To Mr. J. Pratt,
Surgical Instrument Maker,
420, Oxford-street.”

TRADE MARK.

Brown & Polson's Patent Corn Flour,

preferred to the best Arrowroot. DELICIOUS in PUDDINGS, CUSTARDS, BLANCHMANGE, CAKE, &c., and especially suited to the delicacy of

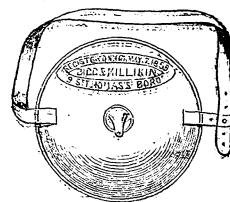

CHILDREN and INVALIDS.

The Lancet states—“This is superior to anything of the kind known.”

Trade Mark and Recipes, on each Packet, 4, 8, and 16 oz.

Obtain it from Family Grocers, Chemists, &c.

77A, Market-street, Manchester; and 23, Ironmonger-lane, London.

Registered No. 4171,

May 7th, 1859, by BIGG & MILLIKIN 9, St. Thomas-street, Borough. MADAME HARRIOT'S MAMMARY FEEDING BOTTLE, or Artificial Breast, by which an infant can receive its food in the most natural position, and be deceived by its pliable and soft texture. It has many advantages that none but a mother can appreciate.—To be had only at BIGG & MILLIKIN'S, Instrument Makers to Guy's and St. Thomas's Hospitals, 9, St. Thomas-street, Borough.

Shoolbred and Bradshaw,

J. & E. BRADSHAW, late

34, JERMYN-STREET.

beg to call attention to the various improvements in Patent ELASTIC STOCKINGS, BELTS, KNEE-CAPS, SOCKS, and Ladies' and Gentlemen's SPINE SUPPORTERS. A new description of BELT, invaluable for prevention of Cholera and the cure of Rheumatism, Lumbago, &c.

N.B. Every description of INDIA-RUBBER BANDAGE, vulcanised on the newest principle.

Directions for measurement sent by post.

N.B. A Liberal Discount to the Profession.

A Female to attend on Ladies.

MEDICAL AGENCY.

NOTICE OF REMOVAL AND CHANGE OF FIRM.

Mr. Lara (for the last eight years the sole representative of LANE and LARA, Medical Agents and Arbitrators and Lunatic Asylum Registrars,) begs to inform the Profession that, in consequence of the daily increasing support with which he has been favoured, and for which he tenders his sincerest thanks and acknowledgments, he has taken into PARTNERSHIP Mr. James Maxfield Walters, a gentleman who has had considerable experience in the business. It will, therefore, from and after Christmas, 1858, be carried on, under the Firm of LARA and WALTERS, at 6, PUMP-COURT, Middle Temple, E.C., whither they have removed their Offices from 22, Buckingham-street, Adelphi, in order to provide that larger accommodation which a constant intercourse with a great majority of the entire body of General Practitioners in England has rendered necessary.

Partnerships and Practices sold and valued: Asylums transferred: Arbitrations effected: Assistants provided (if for a permanence without charge to Employers): and every other description of business transacted for the Profession at a fixed and moderate cost. Attendance from 11 till 4.

Hospital for Sick Children, 49, Great ORMOND-STREET.—A SERIES of LECTURES on the DISEASES OF CHILDREN will be given every SATURDAY during the months of NOVEMBER, DECEMBER, and JANUARY, by Dr. WEST, Dr. JENNER, and Mr. ATHOL JOHNSON, the Physicians and Surgeon of the Hospital. The First Lecture will be given on SATURDAY, NOVEMBER 12, at 3 p.m., by Dr. WEST.

The Lectures are open to Practitioners of Medicine, and to Students after their first year, on written application, addressed to the Secretary at the Hospital.

By order of the Committee of Management,
H. A. BATHURST, Hon. Secretary.

Christian Medical Association.—The

ANNUAL MEETING is proposed to be held at the HANOVER-SQUARE ROOMS, on FRIDAY, November 4, at 8 p.m., J. RISDON BENNETT, M.D., in the Chair. Medical Students are earnestly invited to attend. They will be admitted on presenting their cards of Hospital Practice. Practitioners are requested to leave their private cards.

S. O. HABERSHON, M.D., } Hon. Secs.
CHARLES H. MOORE, }

Great Northern Hospital, King's-

CROSS.—A HOUSE-SURGEON is required for this Institution, in place of Mr. Caleb Evans appointed Resident Surgeon to the Birkenhead Hospital. Candidates must be Members of one of the Royal Colleges of Surgeons. Applications with Testimonials to be addressed to the Chairman of the Medical Committee at the Hospital, before Twelve o'clock on Thursday, the 3rd November. Board and Apartments in the Hospital. No salary. October 21, 1859.

Evening Demonstrations of Anatomy.

—Mr. CHRISTOPHER HEATH, Demonstrator of Anatomy at the Westminster Hospital, will resume his Evening Course of DEMONSTRATIONS and EXAMINATIONS upon the DISSECTED SUBJECT on Wednesday, the 5th of October. The Demonstrations take place on Monday, Wednesday, and Friday evenings, during the Winter Session, from Seven to Nine o'clock, at the Westminster Hospital. Entrance Fee (perpetual) Five Guineas.

Urine.—Dr. Harley will commence

his COURSE of EIGHT LECTURES, for Medical Practitioners, on the PHYSIOLOGY and PATHOLOGY of the URINE and URINARY DEPOSITS, on SATURDAY, October 29. Fee £2. The Lectures will be delivered fortnightly. Gentlemen proposing to attend will please send in their names as early as possible.

Physiological Laboratory, University College, London.

Leicester Infirmary and Fever-House.

A VACANCY having occurred in the office of HOUSE-SURGEON and APOTHECARY to this Institution, by the Resignation of Dr. Sloane, any person qualified, and desirous of offering himself as a Candidate, is requested to send his testimonials, directed to the Secretary, eight days prior to the Election, which will take place at a Special General Board, to be held at the County Assembly Rooms, on THURSDAY, the First day of December next, at Twelve o'clock at noon. The Salary will be £120 for the first year, rising at the rate of £10 per annum until the fourth year, when it will be £150 per annum, with board, lodging, and washing provided by the Institution. The candidate must be a Member of the College of Surgeons, of London, Edinburgh, or Dublin, also a Licentiate of the Apothecaries' Company of London, and have attained the age of twenty-three years.

By Order of the Board,
October 20, 1859. J. H. DAVIS, Secretary.

Broom House, Mansfield, Nottinghamshire.

A PRIVATE ASYLUM for LADIES ONLY. This Establishment hitherto so successfully conducted by the late Booth Edisson, F.R.C.S. will in future be carried on by his Widow, with the Assistance of an efficient Superintendent, and a Medical man in regular attendance. Broom House is contiguous to the Mansfield Station of the Midland Railway, about fourteen miles from Nottingham, and within easy distance of Chesterfield, Worksop, Southwell, and Alfreton. The House is Commodious, and surrounded by several Acres of Garden and Pleasure-ground, and is replete with every convenience for the Classification of Patients of the higher and middle classes; every facility being afforded for Carriage and Garden exercise. Mrs. Booth Edisson is determined that nothing shall be wanting on her part to make this a first-rate Establishment on terms to meet the requirements of the Patients. For further particulars, apply to Mrs. Edisson, or to Miss Stevenson, Resident Superintendent.

Medical Transfer and Partnership.

30, Bucklersbury, Cheapside.

Mr. Orridge, Medical Transfer Agent, Referee, and Valuer of Medical Property, may be consulted, at the above Address, by Gentlemen about to receive PARTNERS, or to RELINQUISH or to COMMENCE Practice.

Mr. Orridge is known to many of the Hospital Physicians and Surgeons of London.

He has been concerned professionally for a considerable proportion of the most influential Practitioners (including Partners in many of the leading Medical Firms), to whom he has the satisfaction of being permitted to refer—a privilege that he trusts will be regarded as a proof of the sincerity of his endeavours to conduct these transactions in an honourable and straightforward manner.

Gentlemen desirous of obtaining Mr. Orridge's opinion, or requiring his attendance professionally in any part of England, can obtain terms on application, by (confidentially) transmitting name and address.

Office Hours, from Eleven to Four.

St. Saviour's Union.—Election of

MEDICAL OFFICER.—The Guardians of this Union hereby give Notice, that they will meet at the Board-room of this Union, situate in John-street West, Blackfriars-road, on THURSDAY, the 3rd day of November next, at Three o'clock in the Afternoon precisely, to ELECT a MEDICAL OFFICER, for the St. Saviour's District of the Union. The salary is £75 per annum, with the usual extra Medical Fees and Vaccination. Applications and testimonials must be sent under cover marked "Medical Officer's Appointment," before Two o'clock on the said 3rd day of November next, addressed to the undersigned, at the St. Saviour's Union Offices, John-street West, Blackfriars-road.—Dated this 22nd day of October, 1859.

JAMES J. BLAKE, Clerk to the Guardians.

The Committee of Visitors of the

LUNATIC ASYLUM for the Counties of Bedford, Hertford, and Huntingdon lately erected near Arlsey, Bedfordshire, are prepared to appoint an ASSISTANT MEDICAL OFFICER to the Asylum, with a salary of £70 per Annum, with Board, Washing, and Furnished Apartments. He must be a Member of the Royal College of Surgeons, London, and a Licentiate of the Apothecaries' Company, and duly registered according to law. He will be expected to enter upon his duties early in the ensuing year, on the opening of the Asylum. Applications, with testimonials, and a statement of Professional Qualifications, age, and previous engagements, to be addressed to the Committee of Visitors, under cover to the Clerk to the Visitors, St. Cuthbert-street, Bedford, on or before the 19th of December next, who will give any further information that may be required.

Bedford, October 10, 1859.

To Surgeons and Chemists.—For Sale,

the Fittings and Stock of a small Surgery. Bottles and Drawers labelled in gold. Counter, Desk, Glass Case, &c. For cards apply to Mr. Arnold, Surgical Instrument Maker, 35 and 36, West Smithfield, E.C.

To be Disposed of Immediately, in

consequence of the declining health of the proprietor, a PRACTICE of Twenty years' standing, in a town in the North of England, where the population is between 16,000 and 17,000. The income is, with appointments which probably might be secured, between £300 and £400 per annum, and an introduction of a few months would be given. The house is well situated, and the fixtures of the Surgery, may be taken at a valuation. For terms, &c., address W. J., Chronicle Office, Preston.

To Surgeons.—To be Disposed of

IMMEDIATELY, a SURGEON'S BUSINESS, newly-established, averaging at the rate of £200 per annum. Rent of House, with nine rooms, exclusive of taxes, £18. It is opposite to an Hospital, where vacancies are frequently occurring for Surgeons. The town contains 16,000 inhabitants, and is not overcrowded with Surgeons. An introduction given. No Good-will required; and Drugs and Furniture to be taken at a Valuation. Apply to Mr. A., care of Mrs. Matthews, 2, King-street, Bath-street, St. Luke's, Middlesex.

Assistant's Situation. — A M.R.C.S.

Edin., having recently had the care of several rural districts as Medical Officer, is anxious to obtain a similar appointment under a Medical Gentleman, as an In-door or Out-door ASSISTANT. The Advertiser is of the middle age, and of steady habits. Excellent references will be given. Apply to A., care of Thomas Chandler, Esq., Surgeon, Sun-street, E.C., London.

For Disposal, an Increasing Practice

in a Beautiful Village in Devon, Established only four years, and realising £250 per Annum. Appointments worth £100. Will be transferred for one year's purchase of contract work. Address, A. B. C. Messrs. Cornish and Lewin, Chemists, Plymouth.

To General Practitioners. — The

Advertiser who has had considerable experience in the Medical Profession and is now leaving his present situation where he has been engaged in the usual routine of a large Country Practice, would be happy to enter into a similar engagement. References given and required. Address, Medicus, Mr. T. B. Hill's, Winterbourne, near Bristol.

London: Printed by CHARLES REED and BENJAMIN PARDON of 1, 2, and 3, Lovell's-court, Paternoster-row, in the City of London, and published by JOHN CHURCHILL, at the Publishing Office, No. 11, New Burlington-street, in the Parish of St. James, in the City of Westminster.—October 29, 1859.

Second Edition, Revised and Enlarged, 8vo, cloth, 5s.
ON DISEASES OF THE RECTUM.
John Churchill, New Burlington-street.

Fifth Edition, 8vo, price 15s.

Neligan's Medicines, their Uses and MODE OF ADMINISTRATION.

Besides numerous and important Additions, the entire work has been thoroughly Revised, and all the formulæ contained in the British Pharmacopœias are, now for the first time, given at length.

London: Longman and Co.

Just published, Part IX., price 5s.

An Expository Lexicon of the Terms,

Ancient and Modern, in MEDICAL and GENERAL SCIENCE. By R. G. MAYNE, M.D.

* * This Part completes the Alphabet, and includes part of the Appendix.
John Churchill, New Burlington-street.

Second Edition, much enlarged, 8vo, cloth 16s.

Human Osteology: comprising a

Description of the Bones, with Delineations of the Attachments of the Muscles, &c. By LUTHER HOLDEN, F.R.C.S., Demonstrator of Anatomy at St. Bartholomew's Hospital.

"This second edition is much improved. In addition to the matter contained in the first edition, this issue embraces the cartilages and muscles of the larynx, and the anatomy of the internal ear, each illustrated by numerous wood engravings and plates. Mr. Holden's work is remarkably cheap."—The Lancet.

"The work is so well known as a most useful aid to the student in learning the bones, that we need only remark that this edition is made more complete than the first, by the addition of the cartilages and muscles of the larynx, and the anatomy of the internal ear."—Medical Times and Gazette.

"No student need seek a grinder as long as he can possess himself of this very admirable volume, which is now the text-book of the schools."—British Medical Journal.

John Churchill, New Burlington-street.

The New Sydenham Society.—

REPRINT OF THE FIRST FOUR VOLUMES.

The First Edition (2000) of Vols. I. to IV. having been rapidly exhausted, and a large number of gentlemen being still anxious to obtain them, the Council has decided to print a Second Edition. The reprint of these books will probably be ready in January. Five Volumes constitute the first year's (1859) series, the last of which is not yet ready, but will be issued in November.

The Subscription is One Guinea, payable in advance, and those desirous of obtaining the works for the current year are requested to make early application.

Prospectuses, information as to the books to be issued for the second year (1860) &c., &c., may be obtained on application to the Secretary, Jonathan Hutchinson, 14, Finsbury Circus, E. C.

Just published, Second Edition, price 1s., per post 1s. 1d.

The Windpipe. New Views on the

Causes, Symptoms, and Treatment (chiefly Dietetic) of Irritative Congestion of the Windpipe, arising from public speaking, colds, &c. occurring also in certain stages of Consumption. By C. B. GARRETT, M.D. Hastings, late Physician to the Kingston Dispensary.

John Churchill, London; and of the Author.

Just published, 8vo, cloth, 7s.

Dedicated by permission to the Right Hon. the Earl of Shaftesbury,

On the State of Lunacy and the Legal

PROVISION for the INSANE; with Observations on the Construction and Organisation of Asylums. By J. T. ARLIDGE, M.D., A.B., L.R.C.P. (Lond.), formerly Medical Superintendent of St. Luke's Hospital.

John Churchill, New Burlington-street.

Just published, 8vo, 1s. 6d.

The Facts and Laws of Life; being an

INTRODUCTORY LECTURE delivered at the Opening of the Medical School of the Westminster Hospital, on October 3, 1859. By J. RUSSELL REYNOLDS, M.D. Lond. F.R.C.P., Assistant-Physician to the Westminster Hospital.

John Churchill, New Burlington-street.

J. Z. LAURENCE ON CANCER.

Just published, Second Edition, Revised and Enlarged, 8vo, Plates, 7s. 6d.

The Diagnosis of Surgical Cancer.

By J. ZACHARIAH LAURENCE, F.R.C.S., M.B. Lond., Surgeon to the South London Ophthalmic Hospital, &c., &c.

John Churchill, New Burlington-street.

Just published, Second Edition, revised, with considerable Additions, post 8vo, cloth, 9s.

A Guide to the Practical Study of

DISEASES of the EYE. By JAMES DIXON, Surgeon to the Royal London Ophthalmic Hospital.

"This second edition is both enlarged and improved, and we can recommend the work to be really what it professes—A Guide—and a very useful and trustworthy guide—to the Practical Study of Diseases of the Eye."—Medical Times and Gazette.

John Churchill, New Burlington-street.

Just published, 8vo, cloth, 6s.

A Practical Account of General

PARALYSIS: its Mental and Physical Symptoms, Statistics, Causes, Seat, and Treatment. By THOMAS J. AUSTIN, M.R.C.S. Eng., lately Medical Officer at Bethnal House Asylum.

John Churchill, New Burlington-street.

Just published, post 8vo, cloth, 7s. 6d.

On the Diseases and Injuries of the

JOINTS. Clinical and Pathological Observations. By THOMAS BRYANT, F.R.C.S., Assistant-Surgeon and Lecturer upon Operative Surgery at Guy's Hospital.

John Churchill, New Burlington-street.

Just published, Second Edition, fcap 8vo, cloth, 3s.

Phthisis and the Stethoscope; or, the

Physical Signs of Consumption. By RICHARD PAYNE COTTON, M.D., Physician to the Hospital for Consumption and Diseases of the Chest, Brompton.

John Churchill, New Burlington-street.

8vo, cloth, Ten Plates, 9s.

On Dropsy connected with Disease

of the KIDNEYS (Morbus Brightii), and on some other Diseases of those Organs, associated with Albuminous and Purulent Urine. Illustrated by numerous Drawings from the Microscope. By W. R. BASHAM, M.D., Physician to the Westminster Hospital.

Whether we have regard to the minuteness of observation and accuracy of delineation displayed in the accounts given of the cases themselves, or the masterly skill with which the important points of each are singled out for observation in the appended 'Remarks,' or to the admirable manner in which the progressive changes in the microscopic characters of the sedimentary deposits are displayed in the plates, we have no hesitation in recommending the book to our readers, as one whose perusal should not be omitted by anyone anxious to treat cases of albuminuria with comfort to himself or advantage to his patients."—Dublin Quarterly Journal of Medical Science.

John Churchill, New Burlington-street.

8vo, cloth, with numerous Tables, price 15s.

Practical Midwifery: comprising an

Account of 13,748 Deliveries, which occurred in the Dublin Lying-in Hospital, during a period of Seven Years, commencing November, 1847. By EDWARD B. SINCLAIR, A.B.T.C.D., Fellow of the King and Queen's College of Physicians in Ireland; Member of the Royal College of Surgeons of England; Ex-Assistant Physician to the Dublin Lying-in Hospital; &c. &c.; and GEORGE JOHNSTON, M.D. Edin., Licentiate of the King and Queen's College of Physicians in Ireland; Member of the Royal College of Surgeons of England; Ex-Assistant Physician to the Dublin Lying-in Hospital; &c. &c.

OPINIONS OF THE PRESS.

"Drs. Johnston and Sinclair aim at putting the Profession, as far as possible, in the same enviable possession of extensive experience as they have themselves. This they do by giving as complete an account as they can of all that they have seen and done, using the form of statistics to secure accuracy and brevity. This is a most useful work, and admirably done."—Edinburgh Medical Journal.

"We cannot withhold our conviction that, whether this work be viewed as a record of clinical experience, or as a depository of well-digested statistical data, it stands unequalled in obstetrics, or, we believe we may truly add, in Medical literature."—Dublin Medical Press.

"Drs. Johnston and Sinclair have had no small field for close observation, and undoubtedly they have done very wisely in presenting the results of their experience to the Profession."—The Lancet.

"We now leave this part of the Report (Instrumental Deliveries), of which, if we have not grievously failed in our purpose, we have said enough to make our readers anxious to study it for themselves; and we have no doubt but that those who do so will agree in pronouncing it one of the most important contributions that has been ever made to practical Midwifery, and one that will afford material for thought so long as obstetric science is cultivated. The anxious care with which the facts have been arranged, tabulated, and compared, so as to bring all into due prominence, must ever reflect credit on the authors, and will, without doubt, serve to advance obstetric medicine."—Dublin Quarterly Journal of Medical Science.

"It is, in truth, an inexhaustible mine of clinical and statistical information upon all subjects connected with Practical Midwifery. The details of practice are particular, without being tedious or unnecessarily minute."—Dublin Hospital Gazette.

London: John Churchill, New Burlington-street.

Dublin: McGlashan and Gill, 50, Upper Sackville-street.

On the 1st of November, 1859, price One Shilling.

The Pharmaceutical Journal. Second

Series. No. 5. CONTAINING THE TRANSACTIONS OF THE PHARMACEUTICAL SOCIETY.

Fcap. cloth, price 12s. 6d.

Dr. Churchill's Theory and Practice

OF MIDWIFERY. The Third Edition, Corrected, Improved, and considerably Enlarged, with extensive Statistics, and illustrated by 119 Wood Engravings.

London: Henry Renshaw, 356, Strand. Dublin: Fannin and Co.

New Edition, price 12s. 6d.

Hooper's Physicians' Vade-Mecum;

or, a Manual of the Principles and Practice of Physic. Sixth Edition, enlarged, improved, and carefully corrected to the present time. By Dr. GUY, of King's College.

This work is not only a complete Manual of the Practice of Physic, but the first part, written by the Editor, contains distinct chapters on the Causes of Disease and Death; the Physiology and Pathology of the Human Mind; the Symptoms and Signs of Disease; the Preservation of Health, including Naval and Military Hygiene, and General Therapeutics.

London: Henry Renshaw; Whittaker and Co.; Simpkin and Co.; J. Churchill; Houlston and Co. Edinburgh: A. and C. Black; MacLachlan and Co. Dublin: Fannin and Co.

Fifth Edition, two vols. fcap. 8vo, price 12s. 6d.

The Dublin Dissector, or System of

PRACTICAL ANATOMY, comprising a concise Description of the Bones, Muscles, Vessels, Nerves, and Viscera, also the Relative Anatomy of the different Regions of the Body; for the Use of Students in the Dissecting Room. By ROBERT HARRISON, M.D., V.P.R.C.S.I., M.R.I.A. Illustrated by 160 Engravings on Wood.

"A work highly and justly esteemed for its amount of information and clearness of arrangement and language. In its present enlarged and improved state it will supply every instruction that the student can require, and it will be the very best companion he can take to the dissecting-room."—William Lawrence, Esq., President of the Royal College of Surgeons, London.

"I have always considered the work the best of its kind; and in this new edition its superiority is, I find, much increased."—S. Wharton Jones, Esq., F.R.S.

"An elegant and valuable work, the companion equally of the lecture theatre and dissecting room."—Medical Gazette.

"Far above all other competitors in its own peculiar department." "It has no rival in any language."—Dublin Journal of Medical Science.

London: Longman and Co.

DR. LITTLE ON DEFORMITIES.

In 8vo, with 160 Engravings and Diagrams, 15s. cloth,

On the Nature and Treatment of

CONTRACTIONS AND DEFORMITIES. By W. J. LITTLE, M.D. Senior Physician to the London Hospital, Founder of the Royal Orthopaedic Hospital, &c.

CONTENTS.

1. Deformities in general. Treatment Operative, Instrumental, and Physiological. Forcible Extension under Chloroform.
2. Contractions from Wounds and Diseases of Joints, Accidents, Rheumatism, &c.
3. Contractions from Spasm, Paralysis, Burns, Habitual Retention in one Position.
4. Deformities from Rickets, Weakness, and Curvatures of Bones.
5. Congenital Distortions and Dislocations, Club-foot, Club-hand, &c.
6. Congenital Malformations, Monstrosities.
7. Distortions of the Spine, from Strumous Disease, Rickets, Lateral Curvature, Spasm, and Paralysis.

Appendix: On Relapsed and Neglected Cases. Index.

"The best treatise on the subject in any language."—The Lancet, the British and Foreign Medico-Chirurgical Review, and the Philadelphia Medical Examiner.

On CLUB-FOOT and ANALOGOUS DISTORTIONS, including their Treatment both with and without Surgical Operation. 8vo. Forty-one Engravings. 12s.

On ANCHYLOSIS or STIFF JOINT: a Practical Treatise on the Contractions and Deformities resulting from Diseases of the Joints. 8vo. Thirty-two Engravings. 7s. 6d.

London: Longman, Brown, Green, and Longmans.

Just published, in post 8vo, price 5s. 6d. cloth,

Handbook of Hospital Practice; or, an

Introduction to the Practical Study of Medicine at the Bedside; with Case-forms, Glossary, and Index. By ROBERT D. LYONS, K.C.C. M.B.T.C.D. &c.; Physician to Jervis-street Hospital, Dublin.

"Such a work affords abundant to himself and real benefit to the room for the display of extensive class of readers for whom it is intended. The manner in which Dr. Lyons has acquitted himself of this sound practical knowledge, and cultivated powers of observation; and difficult and important task is deserving but an accomplished practical physician could execute it with credit."—Medico-Chirurgical Review.

London: Longman, Green, Longman, and Roberts.

Second Edition, fcap. 8vo, price 12s. 6d.

Churchill on Diseases of Children.

"It is indispensable to the General Practitioner."—Medical Circular.
"As the work now stands, it is, we believe, the most comprehensive treatise in the English language upon the diseases incident to early life."—Dublin Quarterly Journal.

London: Longman and Co.

Fourth Edition, fcap. 8vo, price 12s. 6d.

Churchill on the Diseases of Women,

INCLUDING THOSE OF PREGNANCY AND CHILD-BED.

"It has the testimony of our unqualified approbation. It surpasses any other that has ever issued on the same subject from the British press."—Dublin Medical Journal.

"A standard work of reference for the accoucheur and general practitioner."—Edinburgh Medical and Surgical Journal.

"As an epitome of all that is known in this department of Medicine, the book before us is perhaps the fullest and most valuable in the English language."—Dublin Medical Press.

London: Longman and Co.

On the 1st of November was published, price One Shilling, the First Part of a new English Translation of

The Animal Kingdom. By Baron

CUVIER. Profusely Illustrated with Coloured Steel Engravings; together with numerous Notes and Additions by the Translator. Part I. contains Four Coloured Plates of Animals, and a Portrait of the Author.

Sold at the Author's Establishment.

ANATOMICAL APPLIANCES.

HER MAJESTY THE QUEEN, having specially honoured Mr. HEATHER BIGG, of 29, LEICESTER-SQUARE (Author of "Artificial Limbs, their Construction and Application ;" "Deformities, and the Appliances necessary for their Treatment"), with a command to Construct Mechanical Appliances for those wounded Soldiers particularly recommended to her gracious consideration, has led him to bestow considerable attention upon the scientific arrangement of such appliances; he therefore begs to invite Officers and others who are labouring under loss of limb, &c., to examine the Artificial Legs, Artificial Arms and Hands, Spinal Apparatus, &c., he possesses.

Mr. HEATHER BIGG, being conscious that the invention, construction, and application of mechanism for the treatment of deformities are frequently found to be unaccompanied by that enlarged scientific experience which such a subject requires, has recently visited the various Orthopædic Establishments of Paris, Vienna, Munich, Stuttgart, Berlin, Dresden, Cannstadt, Frankfort, &c., for the purpose of personally ascertaining what forms of apparatus were there especially adopted; thus enabling him to place at the disposal of the Medical Profession the resulting advantages.

Mr. HEATHER BIGG, having been for several years Anatomical, Surgical, and Orthopædic Mechanist to the Royal Hospitals of Chelsea and Greenwich, the Admiralty, the Hon. Board of Ordnance, the Hon. East India Company, St. George's, Middlesex, University College, King's College, Royal Free, Guy's, and St. Thomas's Hospitals, has devoted considerable time and experience to the invention, construction, and adaptation of every variety of Anatomical Appliance, and takes this opportunity of inviting the attention of the Medical Profession to the New and valuable Inventions he possesses for affording mechanical aid in cases of Talipes Varus, Valgus, Equinus, and Calcaneus; Lateral, Posterior, Rotative, and Anterior Curvature of the Spine: Inguinal, Femoral, Umbilical, and Ventral Hernia; Prolapsus Uteri and Ani; as well as every variety of Anatomical Deformity.

DR. DE JONGH'S

(Knight of the Order of Leopold of Belgium)

LIGHT-BROWN COD-LIVER OIL.

OPINION OF

EDWIN LANKESTER, Esq., M.D., LL.D., F.R.S.,

Late Lecturer on the Practice of Physic at St. George's Medical School, Superintendent of the Food Collection at the South Kensington Museum, &c. &c.

"I have much pleasure in bearing testimony to the excellent qualities of the Cod-liver Oil prepared under the superintendence of Dr. De JONGH, of the Hague. "I believe that the purity and genuineness of this Oil are secured in its preparation by the personal attention of so good a Chemist and intelligent a Physician as Dr. De JONGH. He was the first Chemist who gave an accurate analysis of the Cod-liver Oil, and the discoverer of an organic substance which it contains.

He has also written the best Medical treatise on the Oil with which I am acquainted. Hence I should deem the Cod-liver Oil sold under his guarantee to be preferable to any other kind as regard genuineness and medicinal efficacy.—S, Savile-row, W., August 1st, 1859."

SOLE CONSIGNEES AND AGENTS,

ANSAR, HARFORD, & CO., 77, Strand, London, W.C.

WALTERS' INDIA-RUBBER URINALS.

F. WALTERS having originally invented these Urinals, begs to warn the Profession of the many bad and useless imitations which are now sold, and he would advise them, before purchasing, to look that they are stamped with his name; as, unless that be the case, he cannot guarantee them.

These conveniences are made for those who require them only occasionally, during a long journey, as well as for those invalids who use them always. Mr. WALTERS has much improved them by making them of *Etherised India-Rubber*, which adds very greatly to the strength of the India-Rubber, at the same time that it prevents its sticking together; by this means he is enabled to make them less stiff and harsh than hitherto, and yet to retain all the advantages of that stiffness. There is a patent valve, which prevents the return of the fluid; and they may be worn either sitting, walking, or lying, without the slightest inconvenience, and without being perceived by any one.

WALTERS' CONVENIENCES FOR LADIES will be found particularly useful during pregnancy. They are perfectly soft and flexible, and may be worn with perfect comfort.

All Orders must be accompanied by a Post-office order or reference.—Entrance for Ladies at the private door, where a Female attends.

Professor of Medicine and Midwifery in the University of Edinburgh.

LECTURE XXIII.—*continued.*

ON OVARIAN DROPSY.

It might appear to you an unpardonable omission were I to quit this branch of the subject without saying a word or two in regard to the

NATURE OF THE FLUID CONTAINED

ordinarily in the cavities of a cystic tumour of the ovary. But it is in reality a subject on which I need say but little. There are no deductions of any practical import, so far as I know, to be drawn from the contained or evacuated fluid, except, 1. That when we see the fluid mixed with pus, lymph, or other inflammatory products, we form a much less favourable prognosis as to the result of the operation of tapping; and, 2. Where it is thick and gelatiniform, we may fail altogether in drawing it off; otherwise I think you will find that the treatment of ovarian dropsy is but little influenced by the nature of the cystic contents. These contents consist, in general, of a watery or viscous fluid, holding in solution varying quantities of albumen, salt and fatty, and extractive matters. In some cases, also, there is more or less colouring matter; but probably this is never present except where there has at some time occurred an extravasation of blood into the sac. Glistening scales of cholesterine are sometimes seen floating on the surface of the evacuated fluid, and fatty particles and crystals, and degenerated epithelial cells are often found suspended in the contents of ovarian cysts, when these contents are examined by the microscope. According to the greater or less quantity of albumen and other solid matters contained in solution, the fluid is found more or less dense and viscous. It coagulates when heated; and often feels viscid and gluey when rubbed between the fingers, as it escapes through the canal. The density thus varies from 1006 or 1007 to 1035 and upwards; but even in the least dense the quantity of solid residue is greater than in the fluid of ascites or any other form of dropsy. In the case of multilocular ovarian tumours, the contents of all the different cysts are not by any means always equally fluid; for while that of the larger ones may be so thin and watery as to flow readily through a common canula, that in the smaller ones may, and indeed often is, still of a viscid or gelatiniform consistence and character.

But let me now proceed to say something as to the

HISTORY AND PROGNOSIS OF THE DISEASE.

The remarks I am now about to make relate almost entirely to the multilocular form of ovarian dropsy; for it is, I repeat, that form of the disease which meets us most frequently in practice, and is made the subject of the most various modes of treatment. The course which it seems usually to follow is somewhat of this kind. It begins at first as a small enlargement of an ovary, or of a part of one, and presents the appearance of a small tumour made up of an areolar or cellular tissue, containing a number of cysts or sacs of varying size, filled with a simple serous fluid. In proof that the cysts forming the first stage of multilocular ovarian dropsy are, sometimes at least, nothing but the normal Graafian vesicles of the ovary enlarged and distended by fluid, it has been latterly averred in Germany that a true ovulum has been found in them in one or two instances, when they were carefully examined at an early stage of the disease. As the development of a dropsical ovary goes on, and the tumour enlarges, the cysts, and more especially those at the periphery, become more and more distended with fluid, and the septa between the different cells become thinner and thinner, till they finally degenerate and are destroyed, and then the contiguous cells come to communicate and to be

fused into the one large cyst or cysts which are, as I have already explained, usually found at the upper part of the mass. The walls surrounding some of the cells, however, always resist the process of degeneration and destruction; and thus there are usually found to be a number of smaller cysts, with strong walls, projecting into the cavity of the larger cell, and appearing like new tumours growing from the interior of its wall; so that the growth of these tumours has sometimes been erroneously described as taking place by the development of small cysts in the interior of a larger mother-cyst. I have spoken of the contents of the cysts as being fluid from the first, but such is probably not the case in the majority of instances; but recent investigations appear to show that in many, if not in most cases, at least, the matter with which the several cysts are filled is not primarily fluid, but more of a gelatinous nature, resembling the contents of the cyst in cases of colloid ovarian tumours. According to this view, indeed, the colloid type of tumour must be regarded simply as usually the earliest stage in the development of the ordinary multilocular dropsy of the ovary, the tumour subsequently attaining its large size by the equable enlargement of an immense number of cysts or cavities filled with a glairy, jelly-like matter, and divided by septa, which, after a time, undergo a kind of fatty degeneration, lacerate, and thus allow of the more or less free intercommunication of several contiguous cysts with each other. The whole tumour, according to this view, retains its semi-solid character, and continues to be elastic to the touch, till a process of softening sets in in the contents of the cavities, which ends in their becoming quite fluid; and as the already altered septa soon give way, one or two large and fluctuating cysts come to be formed, with some smaller ones projecting into their interior. We do occasionally find that an ovarian tumour, into which a trocar and canula have been introduced without bringing away any fluid, have afterwards been tapped, and found filled with fluid, and the explanation of such cases may sometimes depend on such a transformation as that to which I have referred; but it will not always do to wait in every case of colloid tumour of the ovary for the chance of its becoming fluid; and practically, therefore, we must regard them as forming in general two separate kinds of tumour, demanding different kinds of treatment. The manner in which a case of ovarian dropsy may terminate is a subject of much more practical import than the manner in which the tumour originates and grows; and the question of greatest moment in regard to the natural termination of the disease is, whether it is ever cured spontaneously, and if so, whether we have it in our power to imitate the natural process of cure, and produce such a cure artificially. Let me, therefore, discuss with you, for a little, the manner in which Nature sometimes brings about,

1. *Spontaneous Cure of the Disease.*—That spontaneous cures do sometimes occur, is a matter, I would first beg to remark, as to which there can be no doubt. You will occasionally, though very rarely indeed, find patients getting well who have enormous ovarian tumours in the abdomen, and who are apparently in the most desperate condition, with the tumour compressing all the abdominal viscera, and interfering with their functions, and causing obstruction even to the organs of circulation and respiration. Such patients sometimes obtain sudden relief from their sufferings, and the ovarian tumour becomes rapidly diminished in size, from its opening at some weak point, and discharging its contents into the abdominal cavity or on some mucous canal having an external outlet. It has been found even, that while the tumour is still very small, it may be completely cured by its passing between and expanding the layers of the broad ligament till it reaches the Fallopian tube, when it bursts, and its contents escape along the tube, and are discharged through the uterus and vagina. This is a mode of cure which has only begun of late years to be understood and appreciated; and it is not long since a student in Paris obtained a prize for pointing out the frequency with which it actually occurs. He obtained his proofs of its frequency by a series of careful dissections on the dead body; cases in which the smaller forms of ovarian tumours are found not being very rare in the anatomical rooms. Sometimes, but very rarely, an ovarian cyst empties itself by opening into some part of the bowel or the bladder. Before such an evacuation can occur, a degree of adhesive inflammation must first have been set up in the peritoneum, leading to a

union of the wall of the tumour with the wall of the hollow organ with which it is to communicate; and then the communication is produced by an ulcerative process subsequently occurring in this intermediate wall of union. Cases of this kind are from time to time recorded, but they are of very rare occurrence indeed; and it is a process of cure which we have no certain means of imitating artificially. We can only reach an ovarian cyst through the vagina or the abdominal wall; and I know of no authenticated case where an ovarian tumour emptied itself by perforation of the vaginal walls themselves; while evacuation through the abdominal walls has seldom or never occurred except as a result of violence exerted from without. The manner in which Nature most frequently effects a cure is altogether different. The cyst ruptures simply into the abdominal or peritoneal cavity, where fortunately, if its contents are not of an irritating kind, they do not give rise to inflammation of the peritoneum, but are speedily absorbed by that membrane. There is a patient living in the immediate neighbourhood of this city, who had been the subject of ovarian dropsy for many years, and had been tapped about forty times, great quantities of fluid having been drawn off in the course of her long-continuing disease. Six or eight years ago, she went out to feed some birds on a frosty day, when there was ice upon the ground; and having stepped incautiously upon the ice, her feet slipped and she fell suddenly forward, bringing the abdomen violently into contact with the ground. Not having been tapped for some time previously, the dropsical swelling was large at the time, and the cyst being burst by the concussion of the fall, its contents were discharged into the abdominal cavity. From that time to this the tumour in that patient has remained in such a state as to preclude all further necessity for tapping, and it becomes an interesting and important subject of investigation to determine what changes have been produced in such a case. What has happened in this patient is, I believe, this—the cyst having ruptured, its contents escaped in part into the abdominal cavity, and this effused portion became absorbed from the peritoneal surface. The walls of the cyst, however, continued to furnish forth a new quantity of fluid, some of which escaped through the enclosed opening and was likewise absorbed, and the lacerated orifice being thus kept open by the fluid that escaped through it, it was prevented from healing entirely, and a communication has come finally to be established between the interior of the cyst and the abdominal cavity, by which the fluid that continues to be secreted in the former passes on to be absorbed in the latter. The internal surface of an ovarian cyst, in short, is to be regarded as a surface with a great power of secretion, while the peritoneum presents an extensive surface, possessed of a great power of absorption; and when a free and permanent orifice of communication is established between them, a balance is kept up—of secretion on the part of the interior lining of the cyst, and of absorption on the part of the serous lining of the abdominal cavity—which prevents the further accumulation of the fluid, keeps the patient in a state of comparative good health, and renders unnecessary all kinds of surgical interference. A similar result to that which we have found to occur in this patient has been seen in other cases also, where the cyst has been ruptured as the result of an injury; and such an explanation as I have attempted to give of the process of cure in this case is no doubt applicable to the great majority of instances of spontaneous cure of ovarian disease that have been put upon record.

2. *Death from Rupture of an Inflamed Cyst.*—Rupture of an ovarian cyst, however, is not always such a simple and innocent accident, and it does not always lead to a cure of the disease as its necessary result. On the contrary, it is sometimes followed by an immediate attack of acute peritonitis, and a speedy death may be the consequence. Whence comes the difference? How is it, that in one patient rupture of an ovarian cyst and the effusion of its contents into the abdominal cavity leads to simple absorption of the fluid and a rapid recovery from all the symptoms of the disease; while, in another patient the same accident brings on an attack of peritonitis and proves quickly fatal? The solution of the enigma is to be sought for, I believe, in the character and constitution of the contents of the cyst at the date of the laceration. If the sac be filled with a simple, bland, albuminous fluid, pure and unirritating—if, more particularly, the interior of the sac have never previously been the seat of an inflammatory process, and no inflammatory

products have become mixed with its contents, then, when rupture of the walls occurs, these contents may flow out, but no bad consequences may ensue, because the fluid causes no appreciable amount of irritation, but merely becomes absorbed by the peritoneal surface. But if, on the contrary, the lining membrane of the sac be inflamed at the time, or have been the seat of inflammation, or hæmorrhage, or other pathological changes, at any previous period—if, more especially, pus or other morbid products have been thrown out as a result of the inflammatory changes and become mingled with the dropsical fluid,—then when such a deteriorated fluid is discharged into the abdominal cavity in consequence of a rupture of the cyst, it infallibly causes a high degree of irritation in the peritoneal membrane, and lights up an inflammation there that is almost certainly fatal. So that the final issue of any accident to a dropsical patient, which leads to rupture of the ovarian sac and effusion of its contents into the abdominal cavity, depends entirely on the condition of these contents; whether, namely, they be simple and innocuous, or altered and irritating from the admixture in them of inflammatory, or, it may be, of other morbid products.

3. *Death from Exhaustion and the Effects of Pressure.*—Such cases as I have been describing, may perhaps be regarded as exemplifying terminations of the disease, which it is but seldom that we have occasion to witness in practice: for the cases where a spontaneous cure is effected by a laceration, or succession of lacerations, of the sac, which enables nature to reduce and keep reduced the watery collection, are of rare occurrence; and nearly equally rare are those in which death results from the spontaneous or accidental bursting of an inflamed cyst. There is no evidence, at all events so far as I know, that any favourable termination is ever put to the progress of this disease by any change that may take place in the interior of an unruptured cyst; and there is certainly no evidence to show that the dropsical fluid is ever absorbed from the interior of the cyst by the agency of its own lining membrane. We know that that membrane is possessed so far of the power of absorption, that when tincture of iodine is injected into the cavity, it becomes absorbed, and may be excreted by the kidneys and the skin, and exhaled at the lungs. But with relation to its own fluid, it seems to be possessed only of a secreting power; and the law holds good as regards every case of ovarian dropsy that I have ever seen, that no degree of absorption occurs spontaneously under any circumstances, or can be excited artificially by any means at our command. Diuretics or drastics, even the most powerful, are of no avail in this form of dropsy, and never lead to the absorption of the fluid in the interior of an unruptured cyst. In cases of ascites we know that these remedies are often of the greatest value; and when a cyst has been torn, and its contents have escaped into the abdominal cavity, their action may be made use of for the purpose of aiding the absorption of the fluid from the peritoneal surface by procuring and promoting its speedy and steady elimination; but even then their effect is only indirect, and is not the immediate exciting cause of the absorption of the dropsical fluid. Resorption of the fluid by the walls of the ovarian cyst or cysts does not occur naturally, and cannot be excited artificially, and therefore a simple reduction in the size of the tumour is an event that we cannot rationally look for. In the vast majority of cases of the disease its progress is very different. If left to take their own course, the cysts go on filling and enlarging, pressing on the abdominal organs and interfering with their function, so that the patient's strength becomes gradually exhausted, and she at length dies of inanition or atrophy; or of inanition and irritative fever combined; or from the effects of the pressure of the tumour upon the diaphragm, and the abdominal blood-vessels. The obstruction thus caused to the circulation leads to anasarca effusions into the lower extremities, which we generally in vain try to reduce by exciting the action of the kidneys, for their own excretory function is greatly impeded and impaired; and respiration at last becomes almost impossible, because the gradually diminished action of the diaphragm cannot be compensated for by the action of the thoracic walls, which are themselves altered in form, and distended at the base to their uttermost. In a patient thus emaciated and exhausted, death may at any time ensue from the slightest disturbance of any of the ordinary functions of the body, and it is sometimes ushered in by a certain degree

of hectic fever. For we do sometimes see patients die in this way from the effects of the growth of the tumour, which has gone on enlarging in spite of all treatment. But we almost never in practice see an ovarian tumour go on growing in this manner, distressing the patient by its pressure on the abdominal organs, and tending to her destruction by the consequent impairment of their functions, without attempting to do something to afford her, at least, temporary relief, and to prevent her immediate death. And, as a result of such artificial interference, we find a frequent termination of the disease in

4. *Death from, and in despite of, Paracentesis.*—An ovarian tumour, like the gravid uterus, as it enlarges and expands, pushes the bowels on before it, and presses them upwards and to either side, keeping itself always in immediate contact with the internal surface of the abdominal wall, so that when the effects of its pressure have come to be so great as to produce much distress or even to threaten death, it seems but a slight matter to push a trocar and canula into it, and so to evacuate the accumulated fluid. The patient is accordingly tapped, and it may be with immediate relief, and sometimes, though very, very rarely, with final cure; but, as a result of this apparently simple operation, we may also, sometimes, unfortunately find that inflammation of the sac supervenes, and leads to more speedy death. Even when no untoward symptoms are developed, the good effect is usually only of very short duration, for the fluid more or less rapidly reaccumulates and calls betimes for a repetition of the operation. As this alternation of accumulation and evacuation of the fluid continues, the patient becomes more and more emaciated, and the face assumes a peculiar, drawn expression from the atrophy of the fatty tissues, and the development of the facial muscles, more particularly of those around the mouth, so that at last you can almost tell the nature of the disease from looking at the patient's countenance. The tapping requires to be repeated again and again; more or less frequently in different cases; but always as a general rule with shorter and shorter intervals as the disease lingers on, till finally the patient dies exhausted. The immediate cause of death may thus be found, though that is rare, in a form of hectic fever; more frequently it is a low type of inflammation set up in the cyst from the irritation of the oft-repeated operation; but usually it is to be found in the slow and gradual, but at last complete, prostration of all the powers of nature. This final fatal result ensues in the great majority of cases within five years from the date of the first tapping. Sometimes the patient lingers on for eight years; very rarely, indeed, does she live beyond that period; and the number of those who die in less than five years is far greater than the number of those who live beyond it. A large number sink within the first year after tapping is first begun. A considerable proportion die of the immediate consequences of the first paracentesis—that is, within a few days after that event.

M. GEOFFROY ST. HILAIRE on the 10th of May of last year announced to the French Academy the birth of a hippopotamus. We are now told, that a few days after its birth—on the 16th and 18th of May, 1858—intercourse took place between the parent hippopotami, male and female. And M. St. Hilaire now again informs the Academy of the consequence, viz., of the birth of another little hippopotamus on the 18th of July, 1859—fourteen months after conception. “As on the previous occasion, the birth took place in the water. Everyone was surprised to see the little one swimming about by the side of its mother. The mother several times manifested a desire to get out of her house, and when she was allowed to do so, rushed into the water, and a few minutes afterwards a little hippopotamus was seen swimming by her side. As on the previous occasion, the mother destroyed her offspring, seizing and biting it in the belly and thorax.”

CHARING-CROSS HOSPITAL MEDICAL SOCIETY.—The following gentlemen were elected by ballot as the Society's staff for the ensuing session on October 13, 1859:—Hon. President—W. D. Chowne, M.D. President—J. R. Shorto, Esq. Vice-President—Gordon Smith, L.S.A. Council—Messrs. F. Aggett, J. Belcher, Edgar Browne, and T. Dobson. Hon. Sec. and Treasurer—Mr. Frank W. Cooper. The Society will meet every alternate Thursday evening at half-past eight.

ORIGINAL COMMUNICATIONS.

ON THE PROMINENT FEATURES OF THE ULSTER REVIVAL.

By A. CUTHBERT, M.D.

IN attempting to direct the attention of the Profession to some of the prominent features of what is now extensively known as the Ulster Revival, I would desire to premise a few observations in reference to its general character and results. Looking over the surface of society from the stand-point of philanthropy and benevolence, I must express my conviction that a work deep in its springs of action, powerful in the agencies employed, and beneficent in its tendencies, is alone sufficient to account for the results produced. It is the opinion of men of close observation and sound judgment, that more has been done during the last few months towards the solution of difficult social problems, than the earnest benevolent effort of many years had accomplished. “*Ubi tres medici duo athei*,” was the opprobrium of a past age; but there are those who seem to think that the atheism has been succeeded by a materialism hardly less repulsive in its features. I am far indeed from believing this. I have sufficient faith in the Profession of Medicine to believe that where results have been obtained, towards which its own efforts have been long directed, even though accomplished by means little, if at all, anticipated, its members will be willing to rejoice at those results, and as they look over the wide field still left for the exercise of Christian philanthropy, “to thank God, and take courage.”

It is a prevalent opinion, but a very erroneous one, that the physical manifestations form a necessary part of the Revival. So far from this, there are many localities in which these “physiological accidents” (as Dr. McCosh has well termed them) have been altogether wanting, where nevertheless a most remarkable improvement is perceptible in the morals of the people. I have been told by clergymen and others, from different localities, that the number of those physically prostrated bears but a fractional proportion to that of those who have been the subjects of serious religious impressions. No one who ignores this fact can form any adequate conception of the extent and character of the movement. I mention this as a fact, without wishing to enter more fully into such cases. I desire to remember that I am writing in a Medical Journal, where religious subjects, especially such as are open to controversy, would be sadly out of place. It is necessary to bear in mind besides, that we are by no means an excitable race in the North of Ireland. We have a dash of the cool calculation of the Scotchman infused into our lively Irish temperament, which makes us not the best possible subjects for hysteria. We have also been somewhat notorious for an abhorrence of cant and hypocrisy of every form. Yet side by side with these facts we have to place these others, that an affection bearing certain points of resemblance to hysteria has been prevalent among us, and that religious subjects have latterly assumed such importance as to be forced in the most prominent way upon the public attention. It is maintained by many that the affection alluded to is hysteria; but if we grant that hysteria is sufficient to account for the physical manifestations, how are we to account for the moral results? While we believe disease to have been intended for good and benevolent purposes, we cannot overlook the fact that hysteria, involving as it does to a large extent, the perversion of our mental and moral nature, is one of the least likely of all diseases to produce healthy moral action. The hysterical hypothesis fails us here. But it fails us elsewhere. The action and reaction of mind on matter is a subject involved in much obscurity. We know enough, however, to be aware that deep mental distress will cause certain physical effects, of which the most common are excitement and subsequent depression or exhaustion. Surely we have here at once the most natural and the simplest explanation of a large class of the physical phenomena observed in connection with the revival. I have been much surprised to find gentlemen of ability and standing ignoring this well-known fact altogether, and substituting a seemingly elaborate but most faulty physical explanation of these cases. That there

have been many cases of hysteria I freely admit, because I have seen such cases and heard of them from the most trustworthy sources; but I believe that any man who has witnessed much of the physical excitement and prostration, which was so prevalent in many parts of Ulster a short time since, will be ready to acknowledge that in very many of such cases the hysteric hypothesis is untenable unless we are willing to admit that every physical effect of mental emotion, beyond mere expression, is hysteric—an admission which, I presume, none of us are prepared to make. Is the mother hysteric, who in the deep agony of her resistless grief sinks prostrate beside the lifeless form she had so long loved and cherished? Was it hysteria in Belshazzar when in the graphic words of Scripture, "the king's countenance was changed, and his thoughts troubled him, so that the joints of his loins were loosed, and his knees smote one against another"? Every one of us will explain such cases on well-known natural laws, and when in other instances I find a similar cause producing similar effects, I adopt the same explanation,—the simple explanation of the action of natural laws instead of the difficult one of perverted functional action.

1. There was a large class of cases (in my experience by far the most numerous) where the physical prostration was readily explainable by the mental distress. These cases occurred among the poor and ignorant for the most part, and many of their subjects had been living notoriously wicked lives. In these the intensity of the mental suffering, the bitter remorse, the terrible despair, the appalling sense of danger, so clouded the bodily affection, that one little thought of employing such remedies as our laboratories could afford. We recognised at once the mind diseased; and, like Shakespeare's Physician, it was not our province to minister to it. In such circumstances, the consolations of religion were eagerly sought, and under their influence peace was gradually restored to the troubled mind. The chief complaint, apart from the distress of mind, was of a sense of "constriction of the chest," "weight on the heart," "oppression of breathing," etc., as it was variously expressed by those who suffered from it. This appeared to engender an inability to expand the chest to its proper dimensions, so that the breathing was hurried and irregular, and the heart's action somewhat increased in frequency. Conjoined with this there was a sense of weakness or exhaustion varying from what we significantly call *malaise* to the most extreme prostration. This state was very variable in its duration, some remaining in it only a few hours, others for two, three, or even seven days, refusing food, and apparently absorbed in their own mental sufferings. During this period there was nothing to remark beyond the symptoms already alluded to. There was not the multiplying and exaggeration of petty ailments, nor the globus, nor the copious diuresis of hysteria. On the contrary, there was an evident disinclination to make complaints, and even to answer questions in reference to functional derangement, etc. In fact, the mental condition appeared to regulate altogether the bodily state, and with returning calmness and quietude of mind, there returned also the normal health of the body. The majority of persons so affected were females, but many instances have occurred of similar effects in the male subject. Such cases I believe to be little within the province and less under the control of Medicine. Indeed, whatever opinion we may form on this subject, it is certain that our aid is little sought, and in most cases declined; although I have heard of instances in which the effect of cold water was pretty assiduously tried and without any good result. The great majority of persons passed through this state but once; but,

2. There were others in whom the same phenomena recurred many times, who seemed indeed to have learned the habit of producing them, and in whom the very same symptoms became the expression of depraved action. These were persons of a nervous excitable temperament, whose systems had been strained by a kind of excitement altogether novel to them, and in whom perverted mental and physical action was speedily observable. This action was no doubt hysteric, but it was not hysteria in its commoner forms. It was among this class that the visions and trances occurred of which so much has been said and written. Cases of deafness, paralysis, loss of sight and speech, were common among these patients. One of their most remarkable endowments was the power of producing sleep, and of awaking at a specified time. These things were all very wonderful; but, unfortunately for the miracle-mongers, admit readily of explanation on well-known and

acknowledged pathological principles. The name of "cataleptic hysteria" appears the most suitable for such cases. Tending very much to perpetuate these manifestations was the amount of sympathy expressed for them by the numerous visitors who flocked from all parts to witness these strange results, and who sometimes added to their sympathy, the expression of their belief in all the foolish and extravagant statements of the patients. It would have been remarkable if, under such circumstances, there had not been,

3. A third class, in whom hysteria existed without any reference to religious impressions, but arising altogether from the force of sympathy and imitation. These cases were not numerous in this locality, but in other places where the hysteric manifestations were encouraged they were; and I am afraid I must instance Belfast as an illustration of this statement. In this class we again meet with visions, trances, *et hoc genus omne*, which it is not difficult to recognise as the result of disease. These are the cases which those who are opposed to the movement produce as an argument against it. Follow such cases through convalescence into active life, and you will certainly find no moral improvement. It would have been hard to have expected it, yet the over-sanguine are disappointed. For my part, I see in this only an argument in favour of a genuine and good work. Hysteria will produce no good results; but we have been privileged to witness results good and glorious, and while I believe that drunkenness, and blasphemy, and lying, and malice, are the sin and shame of our country, I will welcome the blessed agent that has discarded these crimes from whole districts in Ulster.

Londonderry.

ON CHRONIC INVERSION OF THE UTERUS.

By FRANCIS H. RAMSBOTHAM, M.D.

Obstetric Physician to the London Hospital, &c. &c.

IN the last number of the *Medical Times and Gazette* there is a case published by my friend, Dr. West, of chronic inversion of the uterus, in which he succeeded in restoring the organ to its natural position, nearly a year after the accident had occurred, by means of Dr. Tyler Smith's ingenious method, the introduction of an air-pessary.

Dr. West reports that the woman sought admission into the London Hospital for *phlegmasia dolens*, in October, 1858, seven weeks after her second labour (which had been complicated with retained placenta and great flooding), and a fortnight after the affection of the leg began to show itself; that she remained there a month and was discharged, "much benefited as far as that ailment was concerned;" but that on August 16, 1859, she applied as an out-patient at St. Bartholomew's Hospital, extremely exhausted by uterine hæmorrhage and leucorrhœa, so as to afford "the aspect of a patient suffering from advanced malignant disease." Dr. West at once detected an inverted uterus, which he proceeded to treat. We cannot but suppose that the uterus became inverted at her last labour; consequently it follows that it was in that abnormal position while she was a patient in the London Hospital, and the natural inference is, that this serious derangement had been there overlooked.

I think it necessary to offer the following explanation:—The woman was admitted into that Institution on October 8, 1858, under the care of one of the Surgeons for "inflamed leg," and was discharged on November 2, said to be cured. I understand that, during the time she was in the Hospital not a single morbid symptom appeared to call attention to the state of the uterus, and I never saw her. The case was frequently pointed out to the class as an excellent illustration of *phlegmasia dolens*.

The mode of treatment that was here successful in restoring the uterus must be regarded as a great triumph of Surgery, and I am persuaded that most similar cases would yield to the same plan, if properly directed and persistently prosecuted; because in some few instances the inverted uterus, even of longer standing, has spontaneously righted itself, without any Surgical manipulation whatever having been had recourse to.

Thus Dr. Meigs, of Philadelphia ("Treatise on Obstetrics," Second Edition, p. 697) gives a case of inverted uterus of two years' standing, which he himself saw, as well as Drs. Hodge,

of Pennsylvania, and Warrington, where a spontaneous restoration took place, as was proved by the woman becoming afterwards pregnant; another which he attended with Dr. Lewis, where pregnancy occurred after the womb had been inverted many months; and a third, in a letter from Dr. Hatch, of Kent, Connecticut, seen by him, Professor Beers, Dr. St. John, and Dr. Beardsley, where also pregnancy subsequently took place. Boivin and Dugès, "On Diseases of the Uterus" say, "It is very remarkable that this cure is sometimes affected spontaneously, after a long continuance of the disease" (Heming's Translation, p. 123); and Dailliez (Précis des Leçons de Baudelocque sur le Renversement de la Matrice, Paris, 1803, p. 35) gives two cases seen by Baudelocque, and one by Leroux, in which chronic inversion of some continuance was spontaneously reduced; so that we cannot doubt the fact of its having occasionally happened. But a more extraordinary case than either of the preceding occurred under my own eye. I have published it at length in the fourth edition of my work "On Obstetric Medicine and Surgery," and I repeat it here for the purpose of giving it a more extended circulation:—I was sent for on the evening of July 20, 1839, to a young lady of relaxed fibre and cachectic habit, who had been delivered of her first child after a severe labour twelve hours before, and whom I found suffering from violent forcing pain and great hæmorrhage. She was exceedingly depressed. I detected a tumour occupying the vagina, as large as a man's closed fist, entirely covered by a layer of coagulum. It was sensitive, though not painfully so, possessed a doughy feel, and became harder when compressed. The uterus could not be felt in the abdomen; but above the pubes there was a sensation of a most unusual want or void. As she had passed no urine since delivery I relieved the bladder, and having no doubt that the tumour was the uterus inverted, I made some strenuous efforts to restore it, without effect, but not without putting her to considerable pain. After some time I desisted in despair, fearing that I should lacerate the upper part of the vagina; for the tumour had become very hard while I was making these efforts, and in the same proportion the circle of the mouth became closed around it in the form of a forcibly constricted ring. She passed a quiet night under the influence of morphia, and in the morning voided urine naturally, with some coagula. She was confined to bed for two, and to the house for three, months with severe lumbar pains, and copious irregular hæmorrhages. From the middle of October till the end of December she was free from flooding, but still annoyed by bearing-down pains, attended by a profuse, glairy, leucorrhæal discharge. The hæmorrhage returned, and continued for two months, after which she was moved into the country, and I did not see her again till May 22nd. She was then in such imminent danger that, in consultation with Mr. Hamilton, at that time Assistant-Surgeon to the London Hospital, and with her general attendant, it was agreed to remove the tumour by ligature as soon as she was a little recruited. It was at this time the size of an ordinary nonpareil apple, and had every characteristic of an inverted uterus. On June 5, with the assistance of the gentlemen mentioned above, I placed a ligature round its upper part by means of the double canula. The application gave but little pain at the moment, and the bleeding, which had been going on almost uninterruptedly, ceased immediately. In three or four hours, however, a violent rigor supervened; this was followed by symptoms of intense peritoneal inflammation, and the ligature was removed twenty-four hours after its application. The pain and other inflammatory symptoms gradually subsided; in a few days she was able to leave her room; she menstruated on July 13th less profusely than she had been accustomed to do, and continued regular in that respect; she regained her flesh, colour, and appetite, was able to take a long walk, had no bearing down, nor difficulty in passing water; and when I saw her in January, 1841, she told me that she enjoyed better health than she had done for many years. Nothing solid had ever passed from the vagina since the operation. Early in this year, symptoms of pregnancy manifested themselves; and I attended her of a six months' fœtus on July 7th, in the same year, 1841. Since then I have also attended her with four other children. On one occasion the placenta adhered, and I had to introduce my hand to remove it. I sought for a polypus in the cavity, but there was nothing like one. On another occasion, after the placenta had been expelled naturally, she was harassed with violent spasmodic bearing-down

pains, which induced me to pass my hand into the uterus; I then found the fundus and posterior part of the body protruded considerably downwards and forwards, there existing evidently a disposition for inversion to occur again; this, however, was obviated by the introduction of the hand.

This case for years puzzled me more than any one I ever attended. I had no doubt at any time that the case was one of inverted uterus; but I did not think it possible that the organ could restore itself spontaneously after having been turned inside outwards for nearly a year, and after having been surrounded for twenty-four hours by a ligature which had occasioned such severe peritoneal symptoms as to require its removal to save the patient's life; and yet, the cases given by Dr. Meigs and others would lead us to believe such an occurrence not without the range of possibility; and it ought to give us additional confidence in any effort we may undertake for the purpose of remedying, by manipulation, this serious accident.

8, Portman-square.

ON THE RECENTLY PREVALENT MALARIOUS AFFECTIONS.

By THOMAS B. PEACOCK, M.D., F.R.C.P.

Assistant-Physician to St. Thomas's Hospital, and Physician to the Hospital for Diseases of the Chest, Victoria-park.

(Continued from p. 400.)

It has been said that young children do not suffer from ague; this, however, is incorrect. I have repeatedly seen infants at the breast presenting all the characteristic symptoms of the disease, which have yielded to the employment of the ordinary means. The following table gives the age and sex of 77 patients treated by myself in the out-practice within the last twelve months:—

Years	Males	Females	Total.
1 to 2	1	1	2
2 to 3	4	0	4
3 to 5	0	0	0
5 to 10	4	1	5
10 to 20	4	9	13
20 to 30	9	4	13
30 to 40	8	17	25
40 to 50	9	4	13
50 to 60	1	0	1
60 to 70	0	1	1
	40	37	77

Since my communication on the Relations of Phthisis and Ague was read to this Society last year, I have met with several other instances of the co-existence of the two diseases; a coincidence, which, being thus shown to be by no means rare, is strongly opposed to the idea that there is any opposition or antagonism between them.

The following table gives the forms assumed by the disease in 76 of the above cases:—

	Males	Females	Total.
Quotidian	4	9	13
Tertian	26	18	44
Irregular and Imperfect	10	9	19
	40	36	76

2nd. The forms of remittent fever which have been observed, have been very similar to those which I described in my former paper. The patients when admitted into the Hospital, generally state that they have been indisposed for a considerable period, but occasionally they are reported to have been recently and suddenly seized with rigors, followed by heat and sweating, and the ordinary incurable febrile symptoms. They present the usual symptoms of fever, but with peculiarities which indicate their origin in malarious influence, in contradistinction to true typhus, or, what they more closely resemble, typhoid fever. The face is pallid and puffy; the tongue coated with a thick whitey-brown fur, but generally moist and indented; the breath offensive; the pulse quick, but not feeble; the skin hot, or warm and moist, sometimes profusely perspiring. There is no eruption on the skin, except occasionally

small petechial spots, and the surface has usually a peculiar pallor. The intellectual functions are generally unimpaired; but there is very often distressing restlessness and inability to sleep at night, occasionally with delirium; there is also pain in the head, especially in the forehead, often of a somewhat remittent or intermittent character; with severe pains in the back, loins, and limbs. There is great distaste for food, and sometimes obstinate retching and vomiting, continuing for many days. The bowels are ordinarily confined, but diarrhoea may be a troublesome symptom throughout the attack. With these symptoms there is usually great prostration of strength, and the spleen will be found to be very generally enlarged.

After the patient has been confined to bed for a few days, during which the disease has maintained its continuous form, or with very slight indications of a remittent character,—exacerbations occurring at night, and remissions with increased prostration in the morning, or one day having more marked fever and prostration than another,—it frequently happens that after apparent improvement he has a severe paroxysm resembling an ordinary attack of ague. This attack may have a distinct cold, hot, and sweating stage, but very frequently the first stage is indicated only by some slight chilliness, perceptible to the patient himself, by a sense of cold down the back, or by greater prostration of strength. Sometimes there is decided collapse or syncope, distressing pains in the head, trunk, and limbs, or violent retching and vomiting. The hot stage may immediately follow on these symptoms, or they may continue for some hours. Most generally, during the hot stage, the heat of skin becomes very intense; but it is usually only of short duration, and is followed by profuse perspiration, during or after which the patient becomes very much prostrated, the pulse is weak, faltering, or intermittent; the skin cool; and occasionally he appears to be sinking. During the exacerbation, diarrhoea, if it have been previously present, is generally aggravated, or it may then appear in cases in which the bowels were before confined. Paroxysms of this kind, when they have once occurred, may recur at certain intervals—daily, or twice in the day, on alternate days, or at less frequent periods.

This form of disease, though very threatening in its aspect, is sometimes readily relieved by treatment; more frequently, however, the attacks are very prolonged, and often but little improvement takes place in the patient's condition from day to day. I have not been able to trace any regularity either in the course or duration of the attacks. Sometimes they are peculiarly characterised by the tendency to retching and vomiting, or by excessive restlessness at night, and these symptoms often long resist the measures employed for their relief. When the disease proves fatal, it may be by rapid prostration of strength, by exhaustion consequent on the frequently repeated paroxysms, by cerebral symptoms probably dependant on the unhealthy condition of blood, or by combination with organic disease of the lungs, heart, or kidneys.

In other cases the disease takes a less active form. The patients manifest slight feverish symptoms, and it is often difficult to ascertain the precise period at which their indisposition commenced. They are generally listless and inactive; sometimes they are restless, especially at night; in other cases there is great torpidity and undue tendency to sleep. They often experience headache or soreness in the trunk and limbs, or colicky pains in the abdomen. The appetite is defective, or altogether absent, and often there is nausea or sickness. The tongue is furred, and the bowels are confined. The skin is not usually hotter than natural, and it is generally moist. The pulse is somewhat accelerated; not unfrequently there is a troublesome cough, and some rhonchus in the chest. Often there is a slight bilious tinge of the conjunctivæ and surface, and the aspect is malarious; and generally increased dulness is detectable in the splenic region. Sometimes with these symptoms slight remissions and exacerbations can be detected,—the patients may be less feverish, restless, and prostrated in the morning, and worse again at night,—but in other cases there is very little change in their condition at any period. Usually they continue their occupations, though feeling very indisposed both to bodily and mental exertion, and the affection will hang about them for three weeks or a month, or even longer, till they remove from the locality in which they have been residing, or, the nature of

their indisposition being suspected, recourse is had to the proper treatment.

This form of affection I have chiefly seen in children and young persons, and especially in persons residing in the eastern suburbs of the metropolis; and both on the north and south sides of the Thames.

3rd. In the third class of cases there has been marked and rapidly-increasing anæmia, sometimes combined with purpura and jaundice, and occasionally with paroxysms bearing a more or less close resemblance to any ordinary attack of ague, or of an epileptic or syncopic character, and recurring at regular periods. In the latter class of cases there could be little doubt that the disease was malarious in its origin. In other instances where the paroxysms were absent, very imperfectly marked or irregular, the connection of the disease with malarious poisoning could only be suspected from the well-known aguish character of the district in which the patient was living, or the obviously unwholesome condition of his residence; and from the absence of any other cause,—large loss of blood or organic disease of any organ—to which his state could be ascribed. Such cases are of course open to the doubt as to whether the cause assigned for their production be the true one.

In the fatal cases of this and the last form of disease the only peculiarities detected on post-mortem examination have been the extreme paleness and thinness of the blood, bloodlessness of the different organs and all parts of the body, and considerable enlargement of the spleen.

The following cases afford examples of this form of disease:—

Case 1.—Rapidly fatal Anæmia with tertian syncopic attacks, murmur at the heart and purpurous spots on the skin in a person who resided in a very damp and unhealthy house.

I was requested to see Mrs. P., aged 61, residing in the neighbourhood of Hertford, on the 29th May, 1857. It appeared that she had enjoyed her usual good health till about the 8th of May, when she became slightly indisposed, and she continued to get gradually worse till the 28th, when she was brought up to town. When I saw her she was sallow and thin, her tongue was furred, and the breath very offensive; she had great distaste for food, the bowels were confined, and she was much prostrated. From her symptoms I inferred that she was labouring under hepatic derangement, and suspected the existence of renal disease; but a specimen of the water examined presented no traces of albumen—but was scanty, high coloured, and loaded with the lithates. I directed her to have some mild alterative medicine with salines.

When she was seen the following day I was informed, that after my former visit, she was suddenly seized, while sitting up in a chair, with a kind of fit, and fell down, and on her recovery was not conscious of what had occurred; and it then appeared that she had had a somewhat similar attack the day before she was brought to town. On the 30th she was much in the state which has been described, though more prostrated; and on the 31st she had another seizure similar to those which had occurred on the 27th and 29th. On inquiry I now learnt that the house in which she had been residing, though in a healthy situation on the side of a high hill and with a sandy soil, had for a considerable length of time been very much out of repair. The water of a well, situated in the cellar, percolated through the brick-work, so that the whole house was made excessively damp, and its evident unhealthy condition had attracted the attention and remonstrance of relatives who had visited at the house some time previously. The fits which have been mentioned were not attended by rigors, but were rather syncopic. She was cold at the time, but she was hot and feverish after them, suffered from sickness and vomiting, and became extremely prostrated. Suspecting the origin of her affection in malarious poisoning, I now ordered her to take two grains of quinine in a mixture containing also tincture and decoction of bark, three times daily; to have stimulants freely given, and aromatic spirits of ammonia and compound spirits of ether administered immediately there was any appearance of the occurrence of an attack.

There was not, however, any improvement in her condition. She became daily more prostrated; had almost constant sickness and vomiting, and on the alternate days had two other attacks similar to those described. Though quite rational when addressed, her mind was very drivelling, and she was extremely timid, suspicious, and depressed. The tongue

was coated with a thick, brownish fur in the centre, and white at the sides, and somewhat dry; the breath was very offensive; the bowels confined; the urine was scanty and high coloured, and though frequently examined was always found free from albumen, but loaded with lithates. Petechial spots made their appearance on all parts of the body, and a loud systolic murmur became audible at the base of the heart, but without any increased dullness in the region of the heart, or sign of effusion in the pericardium. The exhaustion rapidly advanced, she became insensible, and died on the 6th of June—twenty-seven days from the commencement of the symptoms, and nine from the time at which they had assumed an alarming appearance. I was unable to procure a post-mortem examination.

(To be continued.)

THE LONDON PRACTICE OF MEDICINE AND SURGERY.

GUY'S HOSPITAL.

BRONZED SKIN.—DEATH.—BOTH SUPRA-RENAL CAPSULES DISORGANISED.

(Under the care of Dr. PAVY.)

A WOMAN, aged 26, was admitted into Lydia's ward, under the care of Dr. Pavy, on July 27. Her skin presented a marked example of the appearances characteristic of the morbus Addisonii, and was at once recognised as such by several independent observers. She had been engaged in service, and brought with her a letter of recommendation from a gentleman in whose house she had formerly lived. He used the expression,—"She seems to have been overworked, and is now suffering either from heart-disease, or impaired digestive powers." We cite this in order to show the impression which her constitutional symptoms had conveyed to an intelligent but non-Medical observer.

It appeared that the change of colour had been noticed as gradually increasing for eight months past. There had been no jaundice, and the sclerotics were of a pearly whiteness. Her face, neck, and shoulders were of a peculiar dirty olive tint. On other parts of the body the colour was not specially remarkable. She was not much emaciated. While being questioned certain twitchings were noticed resembling those of chorea. She had been more or less ill for about a year, feeling weak and ailing, but without being able to specify any particular complaint. She attributed her ailments to overwork. Soon after her admission vomiting set in, which persisted in spite of remedies, and produced great prostration. Stimulants were freely used, but death took place on the 30th July, four days after admission. At the autopsy no morbid appearances were found, except in the supra-renal capsules. The following are the particulars of it as taken by Mr. Moxon, the Demonstrator of Anatomy.

Autopsy, thirty-two hours after death.—External appearances.—The hair and eyes dark; the complexion very dark; brown as bistre about the neck; axillæ; flexures of elbow-joints; elsewhere, in parts, irregularly so, especially on the forehead, which was patched irregularly with darker parts on a sufficiently dark ground. The patient's body was very well developed, and in good condition, with plump and muscular limbs. The lungs were dark, like all the organs, which showed much the colour of the blood, and there was static engorgement of the posterior parts, but the tissue was healthy. The heart was very soft and dark coloured, but its membrane and valves were free from evidence of disease. The cavities contained clots. The peritoneum was healthy. The mucous membrane of the stomach was normal, except a slight degree of ecchymosis at the cardiac end of the stomach. Intestines were healthy. The liver, except that it was dark in colour and flabby, presented nothing abnormal. To its inner surface was adherent the right supra-renal capsule, which, like its fellow, was embedded and lost in a mass which was bounded externally by lymph, which occupied the cellular tissue originally surrounding the capsule, and infiltrated the muscular structures behind, the whole being a mass of about the size of three segments of an ordinary-sized orange, and roughly of the same shape. In section, the interior presented here and there patches of a yellowish-buff tint, isolated by lymph, in a

more or less softened state, in the centre of the capsule. A quantity of encysted puriform fluid was found in the left capsule. They were about equally affected. The kidneys, even when closely in contact with the diseased capsules, were quite unaffected and healthy, their containing fibrous tissues being non-adherent.

KING'S COLLEGE HOSPITAL.

The following are brief notices of the principal operations which were performed at King's College Hospital on Saturday last. We have appended short notes of the observations made by the Surgeon in each case.

EXCISION OF THE HEAD OF THE SHOULDER-JOINT.

A woman, a patient of Mr. Fergusson's, was admitted for long-standing disease of the parts about the shoulder-joint. She had had abscesses or chronic sinuses fourteen years. Mr. Fergusson first saw her a few days ago, and then diagnosed dead bone, but waited until she was placed under the influence of chloroform before he decided on the exact position of the disease, and the steps to be taken for its removal. On then moving the joint, grating was distinctly felt. Having thus ascertained that the disease involved the joint, Mr. Fergusson removed the head of the humerus. He next applied the gouge to the glenoid cavity of the scapula, and removed several pieces of dead bone. During the operation there was for a time rather quick hæmorrhage (at once controlled, however); this Mr. Fergusson remarked was from wound of the posterior circumflex, which was nearly always divided in this operation. He stated that some persons were in the habit of contrasting this operation with that of excision of the hip, to the disadvantage of the latter, on the ground that carious bone could be easily gouged out from the glenoid cavity, but not from the acetabulum. His experience, however, convinced him that it was just as easy to expose and apply the gouge to the acetabulum as to the glenoid cavity.

Mr. Fergusson added some remarks respecting the management of the long head by the biceps in excision of the shoulder-joint. He had, he said, often been asked what became of this tendon, and had been compelled to reply that he did not accurately know, but supposed that, as is the case with the ligamentum teres, in disease of the hip-joint, this tendon is usually destroyed by the disease of the articulation. At any rate he could speak from experience that it was never seen during the operation. In the part of the humerus which he had just excised, the tendon in question was found passing up into the bicipital groove, where it became closely united to the periosteum. Above the extremity of this groove the tendon could not be traced, and had evidently been destroyed by ulceration. Cases of compound fracture, requiring excision of the humeral head, differed, as Mr. Fergusson remarked, from those of disease, inasmuch as in the former the tendon might often be turned aside, and preserved uncut. He did not, however, deem its preservation a point of any great importance.

EXTENSIVE NÆVUS IN THE CHEEK OF AN INFANT.—LIGATURE.

In this case Mr. Fergusson applied a ligature to the chief mass of a nævus on the right cheek of an infant. It was very large, involving most of the cheek, the lower eyelid, and in isolated patches the right side of the nose. He applied two ligatures by the subcutaneous method, and remarked that in a case of this kind it would require several operations to completely extirpate the disease.

ENCYSTED TUMOUR OVER THE CAROTID SHEATH.—REMOVAL.

A young man was admitted with a large fluctuating tumour on the side of the neck, extending from about the angle of the jaw midway to the clavicle, and bulging considerably. It had been punctured a few days before, when bloody fluid escaped. Mr. Fergusson evacuated the contents, which were apparently a mixture of pus and serum, with flakes of lymph. He next dissected out the sac. There was scarcely any hæmorrhage, which he ascribed to his having used the knife

as little as possible, rather trying to tear it away from the tissues.

LONG-STANDING STRICTURE OF THE URETHRA.—PERINEAL SECTION.

The following case illustrates well the mode in which Mr. Fergusson performs the operation of perineal section:—

The patient had been often under the care of Mr. Fergusson during several years. Cure by dilatation had been frequently attempted, but the irritation caused by the instruments was so great that it could not be persevered with, and little benefit was obtained. Perineal section was therefore determined on. Mr. Fergusson first passed into the bladder a small catheter, about No. 2, grooved on its lower convex surface, and then over it, and down to the stricture, a flexible catheter open at the end. After dividing the stricture he easily passed a catheter through the wound into the bladder; but was unable to pass onwards the flexible one introduced by the penis. On removing the instruments, however, he easily introduced a large silver catheter into the bladder, directing it to be kept in for two or three days. Mr. Fergusson, in his remarks after the operation, stated that the difficulty experienced in passing the elastic catheter over the grooved guide, was owing to his not having divided the stricture sufficiently high. He was anxious to divide the spongy portion of the urethra as little as possible, as he felt convinced that the great source of danger in the operation was from the too free incision of this part of the urethra.

CHRONIC DISEASE OF THE BURSA OVER THE LIGAMENTUM PATELLÆ.—ABSCCESS.—REMOVAL.

A woman was admitted, under the care of Mr. Bowman, for abscess in the bursa over the patella. She had had enlargement of it for five or six years, with occasional acute attacks. On admission, the matter contained in it was evacuated; but as its walls were very much thickened, it was determined to remove it. Mr. Bowman made a crucial incision over it, and then dissected back the four flaps of skin, and removed the mass. After the operation, Mr. Bowman remarked that the crucial incision was to be preferred to a single linear incision, as it gave more free vent for the escape of matter, etc., thus reducing the risk of erysipelas, which frequently followed this operation. He explained that the tumour consisted of a thickened part, the result of the repeated and continued irritation, but interiorly of a softer, lymph-like substance more recently deposited, and which presented signs of commencing organisation.

WOOD'S OPERATION FOR THE RADICAL CURE OF INGUINAL HERNIA.

Mr. Wood brought forward to the notice of the gentlemen in the theatre, a boy on whom he had performed his operation for the radical cure of hernia fourteen days ago (a). The patient was a boy, aged 15, and had been ruptured for nine months. There was scarcely any difference between the two sides to be seen; but, on examination, the tissues about the rings could be plainly felt, like a hardened mass, completely preventing any escape of intestines. The patient had recovered without any drawback, and had now no pain or uneasiness, not even on jumping, etc. On account of the patient's restless habits, Mr. Wood considered it wise to apply a truss as a precautionary measure. He stated that this was the fourteenth case in which he had now performed the operation, and in all with success. In one only was there any permanent drawback. In this case varicoele had followed the operation. In another case varicoele had followed, but disappeared again after a short time.

ST. BARTHOLOMEW'S AND THE VICTORIA PARK HOSPITALS.

The following notes are copied verbatim from the *Medical Times and Gazette* for January 7, 1854, p. 11:—

"*Latent Pleurisy with Effusion.—Non-absorption at the End of Nine Months.—(Still under treatment).*"

"T. M., aged 15, a healthy-looking, stout lad, of rather fair complexion, was admitted under Mr. Lloyd's care into

St. Bartholomew's Hospital on April 23, 1853. That the right pleural cavity was quite full of fluid was rendered evident by the usual physical signs. He stated that he had done no work for nine weeks on account of shortness of breath, and that the complaint had been attended at first by a very slight pain in the back. He had, however, slept well, and enjoyed an excellent appetite. There was no feverishness whatever present, and, when quiet, he suffered no dyspnoea. There was a slight duskiness of complexion. The right side had the appearance of bulging considerably, but it measured only one inch more than the left. The intercostal spaces were flattened.

"The boy remained under treatment in the Hospital for three months, during which he was repeatedly blistered, and took for a considerable time diuretics, with small doses of the hydr. c. cretâ. Within a week of his admission he had a mild attack of scarlet fever; and while recovering from that disease, he looked ill, and complained frequently of feeling chilly. Afterwards, however, he regained his health; and for some weeks before his discharge, although the effusion continued as before, yet there had been no general symptom whatever; he could go up and down the Hospital stairs without material inconvenience. Since his discharge he has been frequently seen as an out-patient; and Mr. Lloyd informs us, that on the last occasion there was no evidence of decrease in the amount of effusion. He has returned to light work, and his general health not appearing in any way to be suffering, Mr. Lloyd does not think himself warranted in urging the operation of paracentesis."

A second notice of the same case appeared in our Hospital Reports for December 27, 1856, p. 643:—

"Empyema and Puncture of Chest.

"There is a case (a lad named M—) under Mr. Lloyd's care in St. Bartholomew's well worthy of attention, as an example of some of the events of empyema. He has been under our observation in different Hospitals for nearly three years. In the first instance, he was a remarkable example of immunity from constitutional disturbance, while one pleura was full of pus. Admitted into St. Bartholomew's Hospital within a few weeks of the original pleurisy (the symptoms of which had been very slight indeed), he was so well as to be able to go up and down stairs, and assist the nurses in carrying things for the other patients. His left chest was perfectly dull, but a large majority of those who saw him expressed the most confident opinion that the fluid could not be other than serum, or he must show greater signs of ill-health. While in the Hospital matters continued *in statu quo* as regards the chest, and he at length returned home to assist his father in work as a bricklayer! About six months later, however,—a proof of the correctness of the diagnosis held from the first by Mr. Lloyd and some others,—he suddenly began to expectorate pus freely. This continued, and afterwards the matter made its way through an intercostal space, and an external opening was made. This repeatedly healed up, and was repeatedly reopened, he remaining throughout, in spite of the profuse discharge, in fair health. He was under Dr. Peacock's care in the City Hospital for Chest Diseases for some months. A week or two ago Mr. Lloyd made a free opening into the chest, and there seems a fair chance of the cavity being emptied, should he have strength to survive the process."

The case to which the above extracts refer was one which excited great interest among those who watched its course. The boy was repeatedly under the care of Mr. Lloyd, in St. Bartholomew's Hospital, and more than once was an inmate of the Victoria Park Hospital, under that of Dr. Peacock. His death occurred unexpectedly from profuse hæmoptysis about a fortnight ago, and we were fortunate enough to obtain an opportunity of making a post-mortem examination. Before stating the conditions found at the autopsy, it may be well to introduce a few details respecting the lad's progress subsequent to the last published statement above given. He was at that time under the care of Mr. Lloyd, in St. Bartholomew's, and a free opening had been made into the pleural cavity, between the seventh and eighth ribs, a little posterior to the lateral region. From this opening a free discharge of foetid pus continued for some time, and he was reduced to a state of extreme debility. The discharge, however, subsequently, slowly diminished, and he left the Hospital after a stay of several months, the fistula being

(a) For an account of Mr. Wood's method of operating, see *Medical Times and Gazette*, June 25, 1859.

still open. Some little time after his return home, the fistula healed, and as far as could be gathered from his mother's statement, the expectoration of pus ceased also about the same time. He now resumed his occupation as a bricklayer. He had grown very tall, and was moderately well fleshed.

In October, 1858, an attack of most profuse hæmoptysis occurred. This, with the exception of a very slight spitting of blood in the first week of his illness, was a symptom which was wholly new to him. After a few days it entirely ceased, and he regained his usual state of health and returned to work. In Easter week of 1859, however, a second attack of what his mother called "vomiting of blood," occurred. His mother stated that in the course of a day or two, he must have "brought up a pailful;" and although this, no doubt, was a great exaggeration, it may be taken for certain that the quantity was very large. From this attack he also recovered after a few weeks. From this date until within a week of his death, he was regularly engaged in assisting his father. It should be stated that his parents were in comfortable circumstances, and that he was always well cared for in every respect. The fatal illness commenced on October the 16th. He had been feeling some oppression on his chest, and on Monday, the 18th, walked up to St. Bartholomew's, to see Mr. Lloyd. He returned home considerably fatigued, and in the night was again seized with profuse hæmoptysis. The expectoration of blood continued to recur in large quantities, and at frequent intervals, until Thursday, when death took place. His mother stated that a fit of violent convulsions immediately preceded death.

Briefly to resume the facts of this case, we have, then, an attack of latent pleurisy, with copious effusion, occurring in a healthy boy of 15. The pleura having remained full, without any relief, for about nine months, the fluid found its way through the bronchial tubes, and on expectoration, proved to be thin pus. From this time forwards, for about three years, the empyema continued to find its canal of exit through the lungs. Subsequently, however, an abscess forms externally, and is opened, making a free communication with the lowest part of the pleural sac. After a time the empyema appear to have been wholly emptied, both the external and pulmonary fistulæ heal, and the patient recovers, with, however, evidence that the affected lung has become collapsed and useless. Then at length occur, at long intervals, three attacks of most profuse hæmoptysis, after the last of which, caused apparently directly by the loss of blood, death takes place.

Autopsy.—The post-mortem was performed at the boy's own home by Mr. Hutchinson, and Mr. Hughlings Jackson, on October 23. The ends of the fingers were somewhat clubbed, but not in extreme degree. On exposing the corpse it was seen to be well nourished, and fairly muscular. The right side of the chest was greatly contracted, and, as measured by the eye, did not appear to have half the capacity of the opposite side. On percussion a clear resonant note was elicited over every part of the left side, and also over the whole of the sternum, extending, even at the lower part, to the cartilages of the right ribs. Between the right nipple and the right border of the sternum was a space which was quite dull on percussion; but the right side in front, with the exception of this part, gave a box-like tympanitic sound. It was judged that the dullness referred to was occasioned by the displacement of the heart. On raising the sternum this surmise proved to be correct, as the heart lay wholly to the right. The left lung was very large, emphysematous on its surface and its edges, and did not collapse at all when the chest was opened. On its posterior and depending part were some small spots of ecchymosed tissue, resembling those of pulmonary apoplexy, but with these exceptions, the lung was everywhere crepitant and healthy. The right lung was collapsed, and excepting at its apex and down its anterior surface, where a small layer of crepitant and in parts emphysematous tissue existed, it was solid throughout. The adhesions which everywhere united it to the ribs were firm, but not very thick, and excepting over a small space posteriorly nowhere of that densely indurated character (fibro-cartilaginous) often seen after old-standing empyema. No fluid was present in any part of the pleural sac. Indeed, the sac was everywhere obliterated by the adhesions. A collection of thick pus, about as large as a hen's egg and evidently in process of absorption, was found in the lower lobe of the lung close to its external surface. No fistula communicated

with this cavity. The bronchial tubes were not dilated. The tissue of the consolidated lung was densely carnified, and in many parts much congested. There was nothing, however, at any particular part denoting the exact spot from which the fatal hæmorrhage had proceeded. The heart was large, but without disease, not a single trace of adhesion or inflammatory thickening existing either in the pericardium or in the left pleural sac. A cluster of bronchial glands on the right side of the trachea had been disorganized and converted into a dense tissue, in the centre of which a mass of cretaceous material was encapsuled. In the apex of the right lung also was an irregular piece of dry chalk, about the size of a small hazel-nut, which had evidently resulted from the absorption of tuberculous deposit. There was not, however, in any part a single trace of recent tubercle. The stomach was opened and found perfectly free from blood.

THE LONDON AND PROVINCIAL PRACTICE OF MEDICINE AND SURGERY.

COMMENTS ON CASES OF TRACHEOTOMY FOR CAUSES NOT INCLUDED IN THE PREVIOUS REPORTS.

THE nine cases which we have to notice in this Group (see p. 383, Oct. 15) are so dissimilar among themselves, that the reader's convenience would be in no way served by our placing them in the tabular form. Of the nine cases all, excepting one, ended fatally. The case which recovered is the one to which the subjoined note, etc. refer, and in which the operation was performed on account of rupture of the trachea by violence. Of the eight fatal cases, in two, death occurred immediately after the completion of the operation. In one of these the patient was a boy, aged 3, and the cause of obstruction was a post pharyngeal abscess connected with the spine; and in the other the operation was performed on account of most urgent dyspnoea, consequent on acute oedema of the tissues of the neck. Of the remaining six cases, in one the disease was a mass of medullary cancer, which almost surrounded the trachea. In this instance some relief followed from the operation, but the patient survived only eighteen hours. In one the disease was malignant stricture of the oesophagus, and in this although the operation afforded temporary relief; death occurred shortly afterwards. In one repeated attacks of spasmodic dyspnoea had occurred during the course of malignant disease of the larynx. The operation in this instance afforded complete relief, but death from pleuro-pneumonia followed on the third day. In the sixth case, the trachea was opened in order to relieve the alarming symptoms caused by spasm of the glottis in a woman, who was the subject of idiopathic tetanus. The operation afforded great relief, but the tetanus persisted, and death ensued two days afterwards. In the seventh, a boy was admitted into the London Hospital, having been suspended from a crane by his handkerchief. His neck had been severely crushed. Tracheotomy afforded complete relief, but death occurred suddenly twenty-four hours afterwards with all the symptoms of asphyxia. In the eighth and last case laryngotomy was resorted to in order to relieve the dyspnoea caused by the pressure of a large bronchocele. It did no good, and the patient died twelve hours afterwards. At the autopsy the trachea was found compressed laterally to a mere chink.

ADDITIONAL PARTICULARS TO CASE No. 86.

We have been favoured by a correspondent, who sends both his name and address, with the following additional particulars respecting one of the cases of tracheotomy recently published in our pages.

The case to which they refer was that of a labourer, aged 20, who had been admitted into a provincial Hospital, having had his neck crushed between the buffers of two railway carriages. His trachea had been ruptured, and emphysema of the neck and numbness of the arms followed the injury. In the course of a few days his dyspnoea had become so urgent as to threaten life. Tracheotomy was then resorted to. Our correspondent's letter mentions several facts respecting the operation and its sequences which were not in our possession previously, and which we think our readers will

agree with us in considering of much too great practical importance to be passed over in silence. For reasons which will be understood, we omit names.

[To the Editor of the Medical Times and Gazette.]

SIR,—In your last week's impression I noticed the report of a successful case of tracheotomy, at which I was present when a pupil of the — Royal Infirmary, and I think a few remarks are necessary, in justice to the gentlemen by whose means the patient was saved, but whose names I see are not mentioned in the report.

The facts of the case are as follows:—After Mr. —, the Surgeon to the Infirmary, had made his incision, exposing the ruptured trachea, all attempts at restoring respiration failed, and the man, after having been turned head downwards to displace, if possible, the blood that had probably accumulated in the thorax, was then left, as it seemed, hopelessly dead upon the floor. Mr. — and most of the pupils having left the ward, Dr. Halford, then Senior House-Surgeon at the Infirmary, raised the man from the floor, and at once inserted a long canula into the sternal extremity of the ruptured trachea, and then immediately commenced sucking up the blood, mucus, etc. with his mouth, having repeated which several times, respiration reappeared, and the man thenceforth lived, and is alive at present. Before leaving the ward, however, Dr. Halford left the patient under the care of Mr. —, one of the resident pupils, who had, at the same time, under his care Case No. 30, in which Dr. Halford had a short time before successfully operated. With Mr. — Dr. Halford left instructions to repeat what he himself had done if necessity arose, and in the course of a few hours Mr. —, at various intervals, removed with his mouth whatever fluid was accumulating in the thorax.

As this is one of the best cases I ever remember, I feel compelled to send you the above particulars, and hope you will give them space in your Journal.

I am, &c.
JUSTITIA.

THE PROVINCIAL PRACTICE OF MEDICINE AND SURGERY.

THE NOTTINGHAM GENERAL HOSPITAL.

CYSTIC DISEASE OF THE TESTIS.—REMOVAL.— DEATH FROM INTERNAL DEVELOPMENT OF CANCER.

(Under the care of Mr. WRIGHT.)
[Reported by Dr. SLOANE.]

J. S., aged 29, from Calverton, in Nottinghamshire, was admitted into the General Hospital, Nottingham, in August, 1852. He was not strong, but was otherwise healthy. Eighteen months previous to admission, he began to suffer a lancinating intermittent pain on the crest of the right ilium, two and a-half inches from the anterior superior spinous process, which shot down to the right testis, and to the lower border of the sacrum. About a month afterwards he observed that the right testis began slowly to enlarge, which continued till his admission into the Hospital. He then, in addition to the before-mentioned pains, complained of one which extended down the thigh in the course of the anterior crural nerve. His right testis was as large as a goose's egg, painful when percussed or jarred, but not so on the application of firm, steady pressure. There was some enlargement of the superficial veins; obscure fluctuation was detected, and Mr. Wright, whose patient he was, introduced a trocar and canula, and drew off a small quantity of thick, muddy fluid. In October, Mr. Wright removed the diseased testis in the usual way, and in six weeks the wound had healed by granulation, and he was discharged. The testis, after removal, was examined microscopically by Dr. Ransom, and Mr. Thomas Wright, Physician and Surgeon of the Hospital. They found the disease to be cystic sarcoma. There was also some fat deposited in the course of the puncture made by the trocar. No trace of malignancy was discovered. In February, 1853, he was again admitted, with a fungous growth as large as a pigeon's egg, over the right external abdominal ring. A few days previous to admission there had been an oozing of

blood for twenty-four hours from this tumour. He believes that altogether he lost a pint of blood. This tumour afterwards enlarged, and continued to bleed. He afterwards returned to his home, where he died on May 30, the abdominal parietes having previously given way at the seat of the tumour, and the bowels protruded.

THE ROYAL CORNWALL INFIRMARY.

CASES OF CANCER OF THE PENIS.

(Under the care of Mr. MICHELL.)

The three cases following were all under the care of Mr. Michell—a fourth was admitted under the late Mr. Spry, but the disease had advanced too far to allow of any operative proceeding. We publish the cases as an interesting appendix to the statistics of Amputation of the Penis which we recently brought before our readers.

Case 1.—W. B., aged 42, admitted June, 1856, with epithelioma of prepuce and glans penis, both of which were partially destroyed by ulceration. This patient was the subject of congenital phymosis. When admitted the patient was in a very cachectic state, and the operation was deferred until the beginning of July. The glands in both groins were enlarged. He recovered from the operation, but died about six months afterwards from an extension of the disease.

Case 2.—J. J., aged 55, admitted June 11, 1856, with epithelial disease of penis. In this case the glans were most involved, and the inguinal glands were enlarged. On June 16th the diseased part of the penis was removed, and he was discharged in about a month. He was in a very fair state of health eighteen months afterwards, the disease not having recurred at that time. In this man, too, phymosis was congenital.

Case 3.—J. S., aged 41, admitted September 12, 1859. A very unhealthy-looking man. He had had epithelial cancer of penis between two and three years. On September 13th more than half the penis was removed. He recovered and was discharged on September 29th. In this patient the inguinal glands were enlarged. He had always had phymosis. After the amputation, instead of making the man wear a tube to secure the patency of the urethra, Mr. Michell stitched the upper three-quarters of its lining membrane to the walls of the corpora cavernosa, the lower part to the integument. To this is partly to be ascribed the patient's speedy recovery.

SOCIETY FOR RELIEF OF WIDOWS AND ORPHANS OF MEDICAL MEN IN LONDON AND ITS VICINITY.—The half-yearly general meeting of the members of this Society was held on October 26, to acquaint the members with the affairs of the Society during the preceding six months. From the last half-year's balance-sheet, it appeared that thirty-eight widows had received £717 10s. half-yearly relief, and twenty-three children, £164, with £25 as a grant towards self-maintenance, besides £139 9s. 3d. for necessary expenses; and that there are 390 members at present on the list. A new law was carried, authorising a grant in certain special cases to the widows or children of such gentlemen as had, after two years' subscription, ceased to be members of the Society from non-payment of subscription during fifteen months, provided the non-payment had arisen from occasions over which the members had no control. The following members were elected officers and directors for the ensuing twelve months, viz.:—*President*: Thomas Arthur Stone, Esq.; *Vice-Presidents*: Martin Ware, Esq., Everard A. Brande, Esq., John Nussey, Esq., Sir B. C. Brodie, Bt., F.R.S., Peter M. Latham, M.D., John Bacot, Esq., Thomas Turner, M.D., D. Henry Walne, Esq., A. J. Sutherland, M.D., F.R.S., Edward Tegar Esq., Ed. Stanley, Esq., F.R.S., Geo. Burrows, M.D., F.R.S.; *Treasurers*: John Miles, Esq., John Clarke, M.D. (Acting), James T. Ware, Esq.; *Directors*: Richard S. Eyles, Esq., Henry Sterry Esq., G. Hamilton Roe, M.D., Harvey K. Owen, Esq., Henry Lee, Esq., Robt. B. Todd, M.D., F.R.S., Robert Nairne, M.D., William Cathrow, Esq., Edgar Barker, Esq., James Paget, Esq., F.R.S., John Adams, Esq., Fred. J. Farre, M.D., A. B. Barnes, Esq., Edward Dew, M.D., John Love, Esq., H. A. Pitman, M.D., Charles Collambell, Esq., Benj. Travers, Esq., B. J. Babington, M.D., F.R.S., John Weatherfield, Esq., John J. Sawyer, Esq., Thomas Brown, Esq., C. J. B. Aldis, M.D., William Dickinson, Esq.

Medical Times & Gazette.

SATURDAY, NOVEMBER 5.

ORGANISATION OF THE PRACTICAL ARMY MEDICAL SCHOOL.

A DOCUMENT of the greatest possible importance to the Army Medical Department, to the Profession generally, and to the Nation has just been issued from the War Office. It is dated October 17, 1859, and consists of three sections: First, Qualifications and Examination of Candidates for Commissions in the Army Medical Service; second, Organisation of the Practical Army Medical School, including the Subjects to be Taught by the Professors; and thirdly, Rules for the Examination of Assistant-Surgeons previous to Promotion. We now publish, for general information, an abstract of each of the Sections.

I. As to the Qualification and Examination of Candidates before entering the Service, it is provided that the candidate must be unmarried, not above 26 nor under 21 years of age, and produce certificates of moral conduct and character. He must make a declaration that he does not labour under any imperfection or disability that can interfere with the most efficient discharge of the duties of a Medical officer in any climate. He must possess a diploma or licence in *Surgery* from some British College or Faculty, and also a legal qualification to practise *Medicine* in Great Britain or Ireland. The double qualification is thus imperative. In addition to this, the following certificates will in all cases be required:—

1. Of his having dissected the whole body once at least.
2. A course of operative surgery, with a certificate of having performed all the great operations on the dead body.
3. Three months' practical chemistry. The certificate must state that the pupil has conducted chemical analysis himself during the whole of that period.
4. Three months' natural history or comparative anatomy.
5. Practical midwifery, a certificate of having attended twelve cases.
6. Three months' lectures on ophthalmic surgery.

Certificates of having attended the following courses of instruction are also recommended but are not imperative:—

One course of natural philosophy, logic, dentistry, mathematics, French and German.

Then with regard to the Examination at the Department, it is provided that on producing the foregoing qualifications and certificates, the Candidate will be examined by the Examining Board on the following subjects:—

Anatomy and physiology; surgery; medicine, including therapeutics, the diseases of women and children, pharmacy, and the laws of health; natural history, including zoology and comparative anatomy; botany; physical geography, including meteorology. The subjects for the three last heads of this examination will be taken from the following books: Carpenter's *Zoology*, edited by W. S. Dallas, F.L.S.; Rymer Jones' "Outlines of the Structure and Functions of the Animal Kingdom," or "Cours Élémentaire d'Histoire Naturelle," par Milne Edwards; Lindley's or Henfrey's "Elements of Botany;" Somerville's "Physical Geography;" Kemptz'

"Treatise on Meteorology;" Lyell's "Elementary Geology," or Page's "Advanced Text-Book of Geology."

This is merely a preliminary examination, and the names of Candidates who pass it will be sent to the Director-General and communicated to the Professors of the Army Medical School. The names will be arranged in the following Classes:—

CLASS I.—Names of those who have passed a pre-eminently distinguished examination, arranged in their order of merit. Characters which distinguish the excellence of each. General estimate of individual capacity, or fitness for special service.

CLASS II.—Names of those who have passed a creditable examination, arranged in alphabetical order. Statement of the topics in which each has individually excelled, and a general estimate of his individual capacity.

CLASS III.—Names of candidates who have passed the minimum examination, arranged in alphabetical order. Statement of the particular branches of science in which each has been found to be deficient.

This information will enable the Professors of the Army Medical School to carry out their instructions with a definite aim as regards each class.

Then follow certain regulations directing that, after passing his preliminary examination, every candidate will be required to attend one entire course of Practical Instruction at the Army Medical School, before being admitted to his examination for a commission, on—Hygiene, Clinical and Military Medicine, Clinical and Military Surgery, Pathology of Diseases and Injuries incident to Military Service, and Applied Chemistry. These courses to be of not less than four months' duration. At their conclusion, the candidate will be required to pass an examination on the subjects taught in the School. The examination will be conducted by the Professors of the School. If the candidate give satisfactory evidence of being qualified for the practical duties of an Army Medical officer, he will be eligible for a commission as Assistant-Surgeon. During the period of his residence at the Army Medical School each candidate will receive an allowance of 5s. per diem, with quarters; or 7s. per diem, without quarters, to cover all costs of maintenance; and he will be required to provide himself with uniform—viz., the regulation undress uniform of an Assistant-Surgeon, but without the sword.

There are several points of great importance in the above schedule. The necessity for the double qualification, the additional certificates required (that of "A Course of Operative Surgery, with a Certificate of having performed all the great Operations on the Dead Body," being the principal course not included in other *curricula*), and the competitive examination, all being admirable improvements, though secondary in importance to the next great section we have to notice, namely,—

II. The Organisation of the Practical Army Medical School. We have already stated that candidates for Commissions are to attend a course of instruction at this School, and have appended the subjects of the course. With regard to the government of the School we may add, that the special practical instruction which the school is intended to afford will be given by the following five Professors:—The Professor of Hygiene, the Professor of Clinical and Military Medicine, the Professor of Clinical and Military Surgery, the Professor of Pathology, and the Professor of Chemistry. The School has a distinct and independent existence under the Secretary of State for War, and is governed by its own Senate, consisting of the five Professors and the Director-General of the Army Medical Department. The business of the session will be arranged by the Senate in such manner that there shall be at least six months' residence at the School and Hospital, including courses of not less than four months' instruction by lectures, etc.; so that there shall be two sets of candidates ready for examination for commissions every year.

The lectures and practical instructions to be delivered at the School will be directed exclusively to the specialities of the Military Medical Service.

A full programme follows of the nature of the instruction to be given by the five Professors, arranged as follows:—

1. Lectures and Instructions on Hygiene.
- Part I. Principles.
- Part II. Application of Hygiene to Armies.
2. Clinical and Military Medicine.
3. Clinical and Military Surgery.
4. Lectures and Demonstrations in Pathology and Morbid Anatomy.
5. Lectures and Practical Instructions on Applied Chemistry.

Some further details on this course we shall probably give next week, concluding for the present with a copy of the following:—

RULES FOR THE EXAMINATION OF ASSISTANT-SURGEONS
PREVIOUS TO PROMOTION.

"This examination is intended as a test for promotion, and may be taken at any time after the Assistant-Surgeon has served five or more years.

"When Assistant-Surgeons have served the requisite time, they will be examined in the following manner:—

"A series of printed questions, prepared by the Examining Board, will be sealed and sent by the Director-General to the principal Medical officers of stations where Assistant-Surgeons may be eligible for examination. It will be the duty of the principal Medical officer of the station to deliver these sealed questions to the Assistant-Surgeons, and to see that they are answered without the assistance of books, notes, or communication with any other person. The answers are to be signed, and delivered sealed, to the principal Medical officer, who is to send them, unopened, to the Director-General, together with a certificate from the Surgeon of the Regiment, or other superior Medical officer, that the Assistant-Surgeon has availed himself of every opportunity of practising surgical operations on the dead body (a).

"The Assistant-Surgeon will also be required to transmit, together with his answers to the Director-General, a Medico-Topographical account of the station where he may happen to be at the time, or of some other station where he may have been resident sufficiently long to enable him to collect the necessary information for such a report. Failing this, he will send a Medico-Statistical report of his regiment for a period of at least twelve months.

"If the Examining Board is satisfied with the replies to the questions, and the Director-General is satisfied with the certificates and with the Medico-Topographical or statistical report, the Assistant-Surgeon will be held qualified for promotion.

"The Assistant-Surgeon will thus be subjected to three separate examinations within the first ten years of his service, each examination having a definite object. The first, to ascertain, previous to his admission into the service as a candidate, his scientific and professional education, and to test his acquirements in the various branches of professional knowledge. The second, after having passed through a course of special instruction in the Army Medical School, to test his knowledge of the special duties of an Army Medical officer; and the third, previous to his promotion, to ascertain that he has kept pace with the progress of Medical science."

It would be difficult to suggest any improvement upon this elaborate scheme. Of course, in carrying it out, the results will depend in a great measure upon the ability and earnestness of the Professors in the new School, and of the Board of Examiners. The Profession will scrutinise carefully the names of the gentlemen appointed to these important posts, as upon their character will depend, in a great degree, that of the future officers of the Army Medical Department.

THE LAST TRIAL FOR POISONING.

Nulla aconita bibuntur fœtilibus, said an old Roman. There is no danger of poison for those who drink out of earthenware. The refinement of death by poisoning was reserved for the patrician. So it was with us until the last few

years, when Burial Clubs having made the poisoning of infants a popular means of livelihood, the practice has extended from the infant to the adult portion of the community. Thus last week we had a trial at the Central Criminal Court, where a mechanic of low class was tried for poisoning a poor girl he had seduced by some irritant, which Chemistry, impersonated by Dr. Letheby, was unable to define. We draw attention to it as some important questions were started—such as the difference between gastro-enteritis arising from natural causes and that set up by irritant poison—the curious evidence of Dr. Letheby as to the irritant oil he obtained and its effects on animals—and the ingenious argument of the prisoner's counsel that organic poison may be generated in the human body during life as well as by the decomposition of the body after death. So far as we can understand the case from the published reports of the trial, the woman was first taken ill on Sunday night. There was vomiting and purging on the Monday of *green bilious* matter—no shreds of membrane or blood, such as any corrosive or vesicating poison would produce. When seen on Monday by a Medical man, there was pain not in the stomach chiefly, but *over the whole abdomen*—showing peritonitis or general inflammation. The Medical men describe no appearance of blistering or corrosion of the lips, tongue, mouth or throat. Surely this would not have escaped them had any acrid substance been swallowed. They considered she was suffering from exhaustion, as a result of cholera or diarrhoea, and prescribed accordingly.

The vomiting and purging are said to have continued through the Tuesday more or less, but to have actually *ceased* on the Wednesday, when deceased was able to sit up, to take food, and *retain it on her stomach*. On Thursday the symptoms returned. On Friday peritonitis was for the first time diagnosed, and on Saturday she died.

The appearances were chiefly inflammation of the stomach and bowels (gastro-enteritis), with peritonitis. The greatest amount of inflammation was at two feet from the stomach. This is not usual in acute irritant poisoning. The condition of the throat does not appear to have been examined, although it was most important in reference to the hypothesis of an acrid poison, capable of blistering the lips.

No irritant poison was found either in stomach, intestines, liver, or spleen; but from the stomach and intestines, we are told, there were separated by alcohol, *four drops* or grains of an oil, or acrid matter of some kind, having acrid and virulent properties in the highest degree. The oil was not identified by any one property, as any oil of an irritant kind known in chemistry or pharmacy. It was described as an unknown and unnamed organic poison of an acrid nature, having properties compounded of croton-oil and white hellebore. Its acrid qualities were said by Dr. Letheby, to be proved by its causing blistering, scabbing, burning heat, etc., on his own lips. That it was a poison, and capable of destroying life, was said to be proved by its killing a guinea-pig in ten minutes. On removing the gullet and stomach of the guinea-pig, and re-dissolving the residue of the oil by alcohol, and dividing it among three sparrows, Sparrow No. 1 died in four minutes; Sparrow No. 2 in a quarter-of-an-hour or less; and Sparrow No. 3 was violently *sick* (?), and died the next day. The fact that this bird survived, was ascribed to the giving of treacle and water, as if this could counteract or in any way prevent the action of such a substance as croton-oil, or any similar irritant. There is no doubt that the guinea-pig, and Sparrows No. 1 and 2, died from what Dr. Letheby describes as "spasm of the throat"—asphyxia produced by an acrid substance coming in contact with the glottis. We do not profess to understand how a sparrow with a *gizzard* was *sick*; but admitting the facts, they prove nothing as to the real nature of the substance found.

If it could not be stated chemically what the four drops of

(a) The Assistant-Surgeon may see this certificate before it is sent to the Director-General.

acid matter were, it should have been proved at least, physiologically, that the substance would produce in an animal violent vomiting and purging, and gastro-enteritis, causing death after five or six days—not mere spasm of the glottis. It should have been stated, also, that birds have been killed by extracts from the secretions of the body and from the viscera. (See Christison, Fourth Edition, pp. 78 and 79.)

Dr. Letheby is one of those who hold out for the invariable diffusion and deposition of poison (where poison has caused death) in all the organs. Why was not this oil found in the liver? At any rate, if he thought white hellebore had been taken, veratria should at least have been found, or nothing said about it.

As far as the evidence goes, the deceased was ill before any thing was given to her by the prisoner. He gave to her coffee on the Monday. She complained of it being *bitter*; not of its being acrid and corrosive like the matter which burned Dr. Letheby's lips. The prisoner also gave some milk on the Wednesday, but she made no complaint of that, and it had no effect on her. Croton-oil would not mix with such liquids, and could not have been swallowed by her without producing immediate effects locally.

Considering all this, we believe that the acrid matter was no more than might have been extracted by alcohol from semi-decomposed animal substances. It came opportunely to support Dr. Letheby's view,—that poison always must be found when a person has died from it—although it now appears that we are not obliged to define its nature, nor to show that it will kill animals as it does a human being. If the guinea-pig and sparrows had suffered from violent vomiting and purging, and pain in the abdomen, and had died after some hours or days, and after death there had been violent gastro or gizzard-enteritis, there might have been something in it. As it is, it is the wildest application of experiments on animals that we ever read or heard of, and it is a fact fraught with public danger, if, without specifying the poison, a witness is in future to base his opinion on such indefinite data, and is not even called upon to define the substance which he professes to have found, beyond such a loose statement as this of Dr. Letheby's:—"Although I cannot state what the nature of the ingredient was, I am satisfied that it was an acrid poison of a very deadly character."

We must also express surprise at the evidence, if reported correctly, of Dr. Barker. He says that the fact of an *entire intermission of symptoms for a whole day* on Wednesday was a proof to him of its being more connected with irritant poisoning than disease. This is the reverse of all experience of irritant poisoning. There may be remission, but no intermission.

So far as we can judge by the report, the woman died of peritonitis, preceded by choleraic diarrhoea, and the acrid matter said to have been found had nothing to do with her death. It was not the cause of the symptoms or appearances, but the result of the decomposition of the fluids. Whether we are right or wrong in this opinion, however, we trust some experimental physiologist will put the matter to the test of experiment, and ascertain what products can be obtained from decomposing animal matter by such a process as that employed by Dr. Letheby.

THE WEEK.

A STRANGE case of murder was tried last week at the Old Bailey, and the perpetrator of it left for execution. A Portuguese, engaged as a cook on a merchant vessel, without rhyme or reason of any sort or kind, one night sets to work to kill, right and left, his comrades in the vessel. The captain's throat he cuts; and at last he is secured, after attempting to murder others. He had only been a short time in the

vessel, and nothing was known of his antecedents. Now we can have no hesitation in saying that this man's life ought not to be taken until some attempt at least has been made to ascertain a knowledge of his previous character and history. The act of the murderer—motiveless and unmeaning—was simply the act of a downright madman; so that one of the main elements usually required as proof of murder,—viz. a *motive* for the deed—is wanting. Even the great *Times*, which always calls out so loud for execution in such cases, admits "that it would have been more satisfactory if we could have obtained some knowledge of the details of his previous life;" but this would be too much trouble, as the man is a native of Rio Janeiro! We have none of that maudlin sympathy with criminals of which the *Times* accuses juries and the public, but we know how deeply difficult a subject is that of insanity. We see the most learned non-professional men daily display profound ignorance on the subject. We see, in fact, quite enough to convince us, that taking into consideration the extraordinary phases of insanity, it is criminal to rush to the execution of men like this Charles Annois until every effort has been made to prove him free of insane ideas.

We rejoice, for the sake of the University of Edinburgh, and of science generally, that Edinburgh University has had the good sense to elect Lord Brougham as its first Chancellor. A more fitting man for the office could not have been found in the country. The opponent of his Lordship was the Duke of Buccleuch, whose only claims for the appointment were his high social position and his great local influence. At the close of the poll it was found that Lord Brougham had 655 votes, and the Duke of Buccleuch 419, giving a majority of 236 to the former. We do not doubt for one moment, that the majority would have been immensely greater, had the sentiments of all the Graduates of the University of Edinburgh been taken, and especially of Graduates who live at a distance from, and are not swayed by, the local influences which must have directed many of the votes given on this occasion. The chair was occupied by Sir David Brewster, the new Principal, who had on the morning of the election been inducted into his new office. Dr. Christison proposed, and Sir G. Clerk seconded, the Duke of Buccleuch. Dr. Christison's defence of his choice was unusually unfortunate. It could not have been otherwise, the choice itself being so unfortunate. The Solicitor-General nominated Lord Brougham, and Dr. Alexander Wood seconded him. The Solicitor-General, Maitland, was appointed to the office of Assessor, by a majority of 88 over Sir J. McNeil. The next struggle is for the office of Rector, who is to be chosen by the Students. Lord John Russell, Lord Elcho, Mr. Gladstone, and Mr. Robert Chambers, are all spoken of; but nobody knows who is likely to be chosen. It may be some person not yet named. The election is to take place next week.

On several previous occasions we have expressed our regret at observing that in some of the metropolitan districts the local authorities are apparently doing their utmost to bring into discredit the functions performed by their Medical Officers of Health. In some cases the salaries of these gentlemen have been reduced, in many their recommendations have been slighted, and in most, we fear, there is far from a cordial understanding between the Medical officers and their employers. The Act of Parliament authorising the appointment of Medical Officers of Health, while it recognised the importance of the duties, was entirely silent as to the qualifications necessary for performing them, or as to the remuneration to be allotted for their due execution; while it also conferred upon the Local Boards the monstrous power of dismissing their Medical officers, with or without a reason, and without

any appeal. It seems also to be a doubtful point whether the Boards are compelled to appoint any Medical officers at all, or at least whether they are compelled to elect such officers permanently, or only from time to time, as occasion may require. Of the privileges thus afforded to the Local Boards of tyrannising over the Medical Officers of Health, the aforesaid Boards, as might have been anticipated, have not been slow to avail themselves; and we consequently find that the Medical officers are now treated in pretty much the same manner as their brethren of the Poor-Law service are treated by the Poor-Law Guardians. An instance in point has just occurred in the district of St. George's-in-the-East, where Mr. Pittard, the very able and accomplished Medical Officer of Health, has thrown up his appointment, and the Vestry have both reduced the salary of the office, and have declined, for the present, to fill up the vacancy. The occasion having been favourable for the usual oratorical denunciations against Medical men, the sages of St. George's-in-the-East have accordingly indulged in this favourite pastime, waxing exceedingly witty at the expense of our Profession, and proving to their own satisfaction, that any sanitary supervision of their parish on the part of a Medical officer is entirely useless, and therefore that the office ought to be abolished; or if this cannot be done, that the salary ought to be reduced to so low an amount as to render its acceptance utterly worthless. We are glad to find that Mr. Pittard addressed the assembled vestry in a tone which evidently made the gentlemen wince under the lash; and if the members of our Profession would generally act with equal boldness, the habit of abusing Medicine and its Professors on the part of ignorant officials, armed with a little brief authority, would speedily be suppressed. Hitherto the local authorities have had it nearly all their own way in insulting Medical gentlemen who have the misfortune to hold salaried appointments. But a few more such castigations as those inflicted by Mr. Pittard upon the Vestry of St. George's-in-the-East, for their inhumanity, their arrogance, and their ignorance, will prove to parish vestries that gentlemen of education, merely because they happen to belong to the Medical Profession, are not always to be brow-beaten with impunity.

We have great pleasure in directing attention to an advertisement which makes known that a Series of Lectures on the Diseases of Children will be given every Saturday during the months of November, December, and January, by Dr. West, Dr. Jenner, and Mr. Athol Johnson, the Physicians and Surgeon of the Hospital for Sick Children. The first Lecture will be given on Saturday, November 12, at three p.m., by Dr. West. The Lectures are open to Practitioners of Medicine, and to Students after their first year, on written application, addressed to the Secretary at the Hospital. We trust that this praiseworthy attempt to make one of our Special Hospitals useful to the Profession generally will be held out as an example to other Special Institutions, and followed by them.

We see that an attempt is being made to add another to the numerous Special Hospitals in this metropolis. Ten thousand people die annually of paralysis in England and Wales; and therefore it is necessary that an Establishment should be instituted for the cure of epilepsy and paralysis, and for the manufacturing of a body of Medical men who shall be specially versed in, and, therefore, pre-eminently qualified to treat, these diseases. We need hardly say that of course in this proposed Institution all the abuses of Medical Charities, to which we have so often alluded, and especially the one of gratuitous Medical services, will be duly consecrated. That other shameful one also will assuredly not be omitted, viz., the distribution of the benefits of the Charity

to a class of individuals who are, by their position in the social scale, totally unfit to be recipients of it.

At the Comitia Majora Extraordinaria of the Royal College of Physicians of London, held on the 2nd inst., the following Physicians were elected Fellows of the College:—James Black, Joseph Ayre, William Beattie, Thomas Cammack, John Barclay, Edward Meryon, Nicholas Parker, Hermann Weber, Edward Headlam Greenhow, William Odling, Lionel Smith Beale, Frederick William Pavy, George Rolleston, Charles Radclyffe Hall, Samuel Elliott Hoskins, James Ormiston McWilliam, John Thurnam, Richard Tonson Evanson, Joseph Dickinson, Sir Joseph Olliffe.

We beg to direct special attention to an advertisement published in this number respecting a Memorial to Sir James McGrigor. We have so often expressed our opinion of the great merits of the deceased Baronet, that we need only add our full concurrence with all that Mr. Wyatt has said, and recommend the Memorial to the general support of the Profession.

The signs of the times look portentous, if we may judge from celestial perturbations. Aurora borealis has been brilliant of late. Meteors appear to be wildly rushing about in all directions. The curious combination of snow-storms and thunder and lightning have been witnessed by the writer of these lines. The most terrific, and fatal, and sudden of storms has just swept across this island, apparently embracing every quarter of it, resembling rather a tropical tornado than one of our ordinary temperate gales. Add to these the extraordinary differences of temperature which have marked the month of October; 50° of difference having been noted between the temperature of a day in the first and a day in the third week of it, viz., 22° and 70° Fahrenheit.

The Physicians and Surgeons of Guy's Hospital have awarded the Astley Cooper Prize of £300 to Doctor Crisp, of Parliament-street, Westminster, for his Essay on "The Structure and Use of the Thyroid Gland."

OBSTETRICAL SURGERY.—Dr. Luders relates, in the *Deutsche Klinik*, this case:—A lady, fifty years of age, complained to her doctor of abdominal disorders. *The doctor ordered her to be examined by a Sage Femme*, who diagnosed prolapsus of the womb, and applied a large pessary, which was afterwards replaced by another. This second pessary was introduced with much violence and caused great pain to the patient. The *Sage Femme* on endeavouring the next day to adjust it better, could not find it at all either in the vagina or in the bed. The lady after this remained a sufferer for two years, consulting many doctors. They all made out that a tumour existed behind the vagina, but of its nature none could give account. Happily, at last comes M. Luders, and in the interior wall of the rectum discovers an opening, through which he could feel a hard body. This hard body, which he at last extracted, was a caoutchouc pessary, oval, and three and a-half by two and a-half inches in its diameter. The *causa sublatâ*, the pouch healed up, and in six weeks the lady completely recovered her health.

A NOVEL IDEA.—"In my opinion," says M. Piorry, "vibrations are the key of all nature, and I believe that the science of universal life may gain from their consideration new lights. In *Trisalgie* there is, for instance, a luminous circle, whose contour is zig-zag, and which goes on continually enlarging with continual oscillations. This truth of vibration, long ago suspected by me, has now become a demonstrated fact."

REVIEWS.

Handbuch der Medicinischen Klinik zum Gebrauche für Studenten und Aetzte. Bearbeitet von Dr. RUD. LEUBUSCHER, Professor der Pathologie, und Director der Medicinischen Klinik zu Jena. Erster Band. 2 Hälften. Leipzig. 1859.

Manual of Clinical Medicine for the use of Students and Practitioners. By Dr. RUD. LEUBUSCHER, Professor of Pathology, and Director of the Department of Clinical Medicine at Jena. Vol. I. Second Part.

THE second half of Dr. Leubuscher's manual contains the Diseases of the Organs of Digestion, commencing with the affections of the mouth and oesophagus, and passing in order through those of the stomach, liver, and other abdominal viscera. The Diseases of the Urinary Organs come next, and the volume concludes with the Diseases of the Male and Female Generative Organs.

The author of this manual shows himself to be well acquainted with the progress of practical medicine in the present day, and he has condensed into a systematic form the substance of a great number of monographs upon the special diseases of which he treats. It should also be stated that he appears to have consulted only the best authorities, while his arrangement of a great multitude of diversified materials indicates a well-ordered mind, and a well-directed course of study. The diseases affecting any special organs are introduced by a brief account of the functions of those organs, and a bibliographical record of works relating to their pathology; and general directions are then given for exploring the morbid condition of each structure. Next in order the special symptoms of each disease are related, and its causes and treatment are briefly, but lucidly described. We are particularly pleased with the sections relating to treatment, which indicate sound good sense, and a practical acquaintance with therapeutics on the part of Dr. Leubuscher. He does not seem addicted to any exclusive theory of treatment, but carefully adapts his remedial measures to the peculiarities of each disease, and to the constitution of the patient. His work will be read with profit both by students and practitioners, who will find it a useful guide in their clinical studies or in the active duties of Medical life.

Traité de Chimie Technique appliquée aux Arts et à l'Industrie à la Pharmacie et à l'Agriculture. Par M.-G. BARRUEL. Tome I. II., 1856. Tome III. 1857. Tome IV. 1858 Paris.

(Treatise on Technical Chemistry applied to Arts and Manufactures, to Pharmacy and Agriculture.)

THIS work of M. Barruel forms a complete history of chemistry in its relation to the arts of life, and the theoretical portion is sufficiently explanatory for the guidance of those who may be unacquainted with the principles of chemical science. The first volume is devoted to the description of the non-metallic bodies, preceded by a general introduction on the principles of chemistry. The chief artificial product described is the gas obtained for the purposes of illumination from coal and oil. The second volume treats of the metallic bases of the alkalies and earths, their oxides and salts; and it describes at length the manufacture of gunpowder, the extraction of salt, the process of glass-making and enamel-making, the formation of mortars and cements, of alums and clays, and the manufacture of pottery and porcelain. The third volume contains a description of the metals proper, such as lead, copper, mercury—their oxides and salts, the methods of extracting some of them from their ores, the preparation of colours, the processes of gilding and silvering, galvano-plastic operations, and the principles of photography. The fourth volume treats of the processes employed to obtain the common metals used in ordinary life, the manufacture of steel and of bronzes, the extraction of arsenic, the formation of azure. The applications of chemistry to pharmacy are introduced so far as to make the preparation of the usual pharmaceutical compounds intelligible to the Medical student, but the author disclaims any intention of offering a complete treatise on pharmacy.

M. Barruel's elaborate book will prove of inestimable

service to those who are engaged in the arts connected with chemistry, and it will also be perused with great interest by all who study chemistry as an abstract science. The explanations are in all cases full and explicit, and are accompanied, where necessary, with well-executed engravings.

The Climate of Brighton. By WILLIAM KEBBELL, M.D., Physician to the Sussex General Hospital. Pp. 187. London: 1859.

BRIGHTON, although destitute of natural attractions, has, nevertheless, become, by the general purity of its atmosphere, and its proximity to the metropolis, one of the most favourite and populous watering-places in the kingdom. The idler resorts to it as a scene of gaiety and amusement, and the invalid for the restoration of health. It must be admitted that the salubrity of the climate has not been overrated; and, although Brighton presents no picturesque scenery, the deficiency is perhaps more than compensated by the absence of all conditions injurious to health. The fine open downs in the immediate vicinity of the town offer a pure, invigorating air, untainted with any emanations from miasmatic lowlands, or tidal rivers and harbours; and if the efforts of man were directed more energetically to purify the drains and sewers, it might be alleged that nature and art had both combined to ensure the healthfulness of our London at the sea-side.

Dr. Kebell has put together his materials on the climate of Brighton with considerable skill; but he has, perhaps, unnecessarily entered into general disquisitions on climate and other matters, which have no other effect than to increase the size of the book. Some of his statements will be read with interest, as throwing light upon the meteorology of Brighton, and as contradicting some popular prejudices in reference to its hygienic conditions. It is proved by statistical evidence that in point of dryness and equability of temperature it is pre-eminently favoured by nature; while it is shown that the death-rate, although higher than that which is regarded as normal by the Registrar-General, is less than that of many other towns similarly situated, and would be lower still if the local powers would adopt due sanitary precautions. It is also gratifying to find that the prevalence of scarlatina and diphtheria in Brighton, in the year 1858, has been very much exaggerated by popular belief, and that, in fact, only about fifteen cases of the latter disease really occurred.

While generally commending Dr. Kebell's work, we cannot help remarking that considerable carelessness is evident in its composition and punctuation. In one of the chapters Diphtheria is constantly spelt *Diphtheria*, and porriginous, *poriginous*. The composition is often very faulty, and the punctuation is bad throughout.

Homœopathy and Hydropathy Impartially Appreciated. With Notes illustrative of the Influence of the Mind on the Body. By EDWIN LEE, M.D. Fourth Edition, enlarged. Pp. 155. London: 1859.

HOMŒOPATHY and Hydropathy rest upon very different bases. The former is grounded upon principles which are utterly untenable, and supported by a farrago of mysticism, profanity, indecency, and falsehood. It has taught us that some diseases will disappear spontaneously, as no sane person attributes any efficacy to the globules or dilutions. Hydropathy tells us that water, judiciously applied, in well-selected cases, and with due assistance from regimen and diet, is a valuable auxiliary in the hands of the Physician.

The fact that Dr. Lee's work on these two forms of empiricism has reached a fourth edition, is a sufficient proof that his able denunciations of their short-comings, and his appreciation of any few merits they may possess, are justly esteemed by the public.

FRENCH DOCTORS appear to pay more attention to agriculture than their English brethren. Dr. Mazier has just obtained a prize for a new reaping-machine. The French journal, *Culture*, states that "the number of Doctors who turn their scientific knowledge to a useful account in agriculture is very great."

PROGRESS OF MEDICAL SCIENCE.

Selections from Foreign Journals.

ON OVARIOTOMY.

By Dr. McRUER.

DR. McRUER, in an interesting paper on this subject (*Maine Medical and Surgical Reporter*) divides cases of ovarian disease into three groups, each having, he considers, a different relation to the operation. 1. Those that are ushered in by acute symptoms, and severe constitutional disturbance, producing in their early stages a great prostration of the vital powers. 2. Those cases which are mild in their manifestations, and slow in their progress, producing little or no constitutional suffering, and requiring many years of continuance before a resort to tapping becomes necessary, or a repetition of it required. 3. A group intermediate in its relations to those already mentioned; and to this latter class of cases the author would confine the operation of gastrotomy; and of these a careful selection should be made of such cases as, by repeated minute examinations, exhibit satisfactory evidence of being exclusively ovarian, having a freedom from extensive adhesions, or any other complication objectionable for an operation. Even in these cases the operation ought not to be urged, but only suggested, giving at the same time a candid explanation and avowal of opinion in regard to the chances of success, leaving the decision to the patient; for no person can properly estimate the value another sets upon his life, or make the just deduction from its worth, on account of the sufferings of disease—each case being a problem, having its own peculiar number and variety of elements, and defying an equitable comparison with any other.

The author gives cases in illustration of this division. In Mrs. R. the disease manifested itself by acute suffering in the ovarian region; and the rapid growth of the tumour, on account of the oppression of breathing it produced, compelled tapping to be resorted to in six months from the beginning, and to be repeated in three months after—the case terminating fatally within one year from its commencement. This case, then, belongs to the first group, and no one would be so reckless and inconsiderate as to recommend an operation. Miss S. has had ovarian disease during twenty-five years, suffering no inconvenience except from the bulk of the tumour, from which she obtains relief by tapping every four or six years. She enjoys a comfortable degree of health; and an operation would be objectionable, inasmuch as the continuance of the disease in this mild and sluggish condition is a less evil than the dangers attendant upon gastrotomy. The case of Miss G., aged 22, represents the intermediate or operative group. Dating some amount of uneasiness in the right side, as far back as the summer of 1855, she perceived a circumscribed swelling there in April, 1856. The swelling continued to increase in size, involving the whole abdomen, until February, 1858, when, on account of the distressing oppression, thirty pounds of a dark glutinous fluid were drawn off by tapping. Re-accumulation took place, and, in July, twenty pounds of a much thicker fluid were removed; and, again, another thirty-four pounds in October. As the case seemed in all respects suitable, ovariectomy was performed on November 18, sulphuric ether being employed, and the room kept at a humid temperature of 75°. It was soon discovered to be a "multicyst," and attempts at emptying the cysts failed in consequence of the thick and flaky character of the fluid. The adhesions were so firm that it was impossible to separate them without rupturing many vessels, and leaving attached to the peritoneal surface strips of the outer coverings of the cysts, while during the efforts many of the cysts were ruptured. The pedicle, half the size of an adult wrist, was on the left side, and was secured by a double ligature of linen cord, four of the omental vessels also requiring tying. The whole of the tumour was removed, and the patient rallied very well, her pulse being 70, and of sufficient power. Forty drops of laudanum were given. The ligature of the pedicle came away on the thirty-fourth day; and at the date of the last report the wound had healed, the patient was strong, and her menstruation was normal. The tumour consisted of

numerous cysts of the most varied capacity, its fluid and solid contents being estimated to weigh fifty-nine pounds.—*American Journal of Medical Science*, July, p. 287.

ON THE INTRODUCTION OF MEDICINAL SUBSTANCES THROUGH THE MILK OF ANIMALS.

By M. LABOURDETTE.

M. Labourdette, in his communication to the Académie, gives an account of some extensive investigations he has entered into; and M. Bouley, reporting on the paper, enters also into a general review of what has previously been done. A most extensive series of experiments had been previously performed by MM. Chevallier, and O. Henry, and the results of these were unfavourable, inasmuch as under the administration of medicinal agents, capable of imparting a therapeutical agency to the milk, the animals lost their health, and at no remote period died.

M. Labourdette commenced his experiments by administering iodide of potassium to cows and goats, which in a very short time gave rise to various accidents; and, in all the cases in which it was not suspended, at the end of a few weeks the animal either died, or entirely lost its milk. In this way eighteen animals were sacrificed, notwithstanding the various means adopted to counteract the ill effects of the drug. But these experiments were performed in Paris, and M. Labourdette determined upon repeating them in one of the finest Normandy pastures. There, in dairies and stables of exquisite cleanliness, he has kept cows and goats for five or six years in perfect health, notwithstanding that their milk, as observed personally by the reporter, is impregnated with iodine, mercury, or arsenic. One of the first facts ascertained by M. Labourdette was the ill effects of sequestration. In Paris a cow was not to be kept alive longer than four months, providing that the iodine was not suspended; and even in Normandy, if the cows were kept three, or even two days in the stables, without resorting to the meadows, the same ill effects observed at Paris began to be developed. But even pasturage and free roaming, although essential, were not found to suffice without the aid of an excellent regimen, and the administration of medicinal agents, termed by M. Labourdette *adjuvants* and *correctives*. We have not space to give the details of these, but must refer to the paper for them, as well as for an account of the means by which the animals were induced to take the large doses required, and the mode of treating injurious effects when they appeared. Iodide of potassium constituted at once the most desirable, and the most difficult agent to introduce, being the one tolerated with most difficulty by the ruminant. Next to it in difficulty came mercurials, ferruginous and arsenical preparations being much more easily tolerated, while alkalis, and the chloride of sodium were always taken with pleasure by the animal, the latter being employed as an adjuvant with respect to other substances. The milk of animals thus treated became richer in casein and butter, this being probably due to the regimen employed.

M. Boudet, while admiring the persevering efforts of M. Labourdette, carried on through ten years, still could not admit that the results promised to prove of much practical utility. The small quantity of iodine, for example, that could thus be communicated to the milk, rendered this fluid far inferior in this respect to cod-liver oil; and while in the latter it existed in a natural organic combination, in the former it was only got in by doing violence to the habits of the animal. To act therapeutically, very large quantities of this milk-diet would be required, which might be ill-supported or in other respects objectionable. M. Trousseau observed that he did not believe that the quantity of a substance administered constituted all its consequence. Thus, for example, in the treatment of chloro-anæmia by iron, it was long believed that the iron was only of efficacy when it gained a bodily entrance into the blood, to supply the deficient colouring-matter. It was believed that the minute portions of iron wanting to the blood of a chlorotic woman, were replaced by a certain amount of the enormous quantities taken by the mouth. This theory of the action of iron is now pretty generally abandoned. It is admitted that it acts to a certain extent by modifying the functions, especially operating on the assimilatory functions in such a manner that small portions of iron may be absorbed and utilised, independently of the quantity that has been administered, i.e., that the assimilation operates just as well upon

the iron introduced by aliments, as upon that which may be given in large doses. What is here said of iron may be repeated concerning other medicinal substances to which a purely dynamic action is very generally attributed. Mercury, for example, acts in no other manner in syphilis. No one ever supposed that the direct contact of the mercury with each living particle is necessary for the purpose of neutralising the syphilitic virus throughout the economy. If this were the case, it is evident that the milk of a cow submitted to the mercurial regimen, in order to be efficacious, should contain far larger quantities of mercury than have been discovered in it. "But I am convinced that this milk, independently of the mercury which it contains, acts also by virtue of the properties imparted to it by the general condition induced in the animal by the mercurial regimen. We are daily submitting nurses to a mercurial treatment, intended to act upon infected infants, and although the quantities given to these women are not to be compared to those which these animals were made to take, it is no less true that the health of the nursing becomes re-established. As to cod-liver oil, I am not so certain as M. Boudet, of its owing its efficacy to its iodine; for similar effects are produced by other oils containing not a particle of iodine, or simply by animal fats." M. Piorry could not very well understand M. Trousseau's theory of the action of iron in chlorosis; and with respect to his doubts as to the agency of iodine in cod-liver oil, M. Piorry is enabled to refer to 800 cases of phthisis in which amelioration was brought about by iodine alone: and here it is the iodine acting directly just as it is phosphate of lime in softening of the bones. M. Chatin suggested that these experiments would be best carried on by causing vegetable substances first to absorb medicinal solutions, which they will readily, and then feeding the animals with these. For example, a plant living in an iodised liquid will absorb an enormous portion of iodine, and iodine thus assimilated by a plant becomes a very energetic agent. M. Bouley replied that however seductive physiologically this plan may be, it would be impracticable. M. Labourdette had already expended 40,000 francs on his experiments; but this preliminary vegetable assimilation would require the cultivation of large grounds, and watering them with a very expensive fluid.—*Bulletin de l'Académie*, Tome xxiv. pp. 746, 799.

GENERAL CORRESPONDENCE.

TREATMENT OF CANCER BY CAUSTICS.

LETTER FROM DR. PETTIGREW.

[To the Editor of the Medical Times and Gazette.]

SIR,—In the *Medical Times and Gazette* of October 15th and 22nd, there are a few letters in reference to the treatment of cancer by Dr. Fell, and as I have during the last year removed several tumours from the breast by his process, I beg to submit the same, in the hopes that others will follow that mode of treatment, when removal is not practicable by the knife.

Mrs. K., aged 55, has been suffering from a hard tumour in the left breast, the size of a hen's egg, for two years. Has been very painful the last six months, and when seen was in a state of ulceration, with a very foetid discharge. On the application of the paste the offensiveness entirely disappeared, and the usual incisions being made the mass came away in six weeks without that degree of acute suffering so vividly described by your correspondents. She is now much improved in health and free from pain, and the large thin red shining cicatrix is neither glued to the ribs, nor does it crack or bleed when the patient coughs. In this case no other mode of treatment could have answered, and the patient would soon have been worn out with constant pain.

E. B., aged 45, much the same as the last, only larger, and the whole breast removed in eight weeks. The exciting cause was a blow. In all my cases I have kept them well up with tonics and a generous diet. This patient is now quite well, and in health generally improved.

There can be no doubt but that in the majority of cases the knife is the most expeditious and least painful way of removing the cancerous mass, still the excellent papers that

appear in your Journal from time to time, show how liable even the apparently most favourable cases are to return. As far as I am aware Dr. Fell has never stated that after his treatment the disease would not return, but that he believed his to be more favourable to the patient than the excision by the knife. My own opinion and that of many of my friends is, that Dr. Fell is a most humane man; he is very kind to the poor, and is thought worthy of being placed on the Register of Medical men of our country. Neither is he averse to the knife when thought to be more advantageous than his own proceeding by caustics. I could mention several cases sent by my brother, Dr. W. Vesalius Pettigrew, to have his opinion, and on many occasions the answer has been, "The knife alone."

I am, &c.

FREDERICK WEBB PETTIGREW.

9, Belgrave-road, Eccleston-square.

TREATMENT OF ASCARIDES.

LETTER FROM DR. BIRD.

[To the Editor of the Medical Times and Gazette.]

SIR,—I am glad that your very intelligent correspondent, "W. O. M.," has again called the attention of your readers to this subject, which is, as he states, one of considerable importance to a great number of individuals. I can fully bear testimony to the correctness of his assertion, that, although the complaint *a priori* appears to be a curable one, many persons are tormented with these animals from infancy to their graves; and although many medicines appear for a time to exercise a curative influence, no remedy has hitherto been discovered that in every particular can be looked upon as a specific. I am unable to throw any light upon the inquiry in what portion of the intestines these parasites live and breed, or whether their ova are deposited high up, and the animals developed as they pass down, making their presence known only as they enter the rectum and approach an exit into the outer world; but setting aside this investigation for other inquirers who are doubtless now fully alive to its importance, and who have time and inclination to enter upon the task, I beg to recommend for the use of those who are at present labouring under the complaint, two substances, from the employment of which I have seen incalculable benefit, and succeeded in eradicating intestinal worms, and in many instances effecting a perfect cure. These substances are vegetable charcoal and common salt. The method in which I employ the latter has this peculiarity: I advise it to be taken dry, with a little bread or biscuit, and not in solution—a small teaspoonful is the quantity I give an adult, the first thing in the morning; to children half that quantity. Salt taken in this manner has a widely different effect on the stomach to that produced by salted meats, or when dissolved in broth or water. The pure salt taken in the way proposed is decomposed, and the chlorine liberated before it enters the general circulation, and thus comes more immediately in contact with the thick mucus which forms, it is supposed, the nidus in which the ova of all worms are deposited, and in this manner destroys them. Immediately after breakfast from twenty to thirty grains of purified vegetable charcoal, mixed with a little sugar, and a very little water or weak tea, should be taken; and this quantity repeated after the three principal meals daily: if the sugar is omitted the charcoal answers equally well in a wineglassful of water. In a fortnight's time this treatment is generally successful, though the charcoal may be continued advantageously for a longer period. Both these medicines are highly useful in correcting the evil consequences of malassimilated food. Charcoal, in particular, is a remedy of singular efficacy in most of the gastric disturbances that proceed from the above-named cause, and for all those persons who are martyrs to the maladies incidental to a stomach in difficulties,—maladies that make people miserable, without sending them to bed or absolutely destroying them,—I know of no remedies more deserving of commendation than charcoal and salt. Neither substance can do the least harm to the intestinal walls, while both are correctives of that tendency to rapid putrescency, that pervades all food that is not properly digested; an effect that is invariably followed by all the evils attendant on poisoned blood. Let this fact, however, never be lost sight of, that simple as these medicines are, their adaptation

to individual cases requires judgment, careful watching, and professional knowledge, and that their administration should not be undertaken without due consideration. Again commending "W. O. M.'s" valuable suggestions for a more accurate and scientific investigation into the causes, generation, and localisation of ascarides, with a view to a more efficient mode of treatment.

I am, &c.

JAMES BIRD.

FETAL AUSCULTATION.

LETTER FROM DR. W. WILLIAMSON.

[To the Editor of the Medical Times and Gazette.]

SIR,—The humorous and original remarks on fetal auscultation in your impression of Saturday last by the distinguished translator of Paulus Ægineta, will no doubt excite a smile on the countenances of most of your readers.

For some time past I have been aware of my learned friend entertaining doubts as to the utility of the stethoscope in Medicine, but I had no idea his scepticism had carried him to such extreme lengths as to compel him to propound the heterodox views contained in his "Fatal Case of Aneurism in a Pregnant Woman."

Much discredit has been thrown on the microscope and stethoscope by the ill-judged zeal of some observers in the attempt to make them do too much. Yet both are eminently useful, and when used, as they ought always to be, as aids to other means of diagnosis, will materially assist an unbiased mind in forming a correct opinion in a difficult case.

The organ of hearing may be in all respects perfect, yet it will fail to detect any abnormal sound in a thoracic or abdominal aneurism when the conditions requisite for the production and transmission of such sound do not exist.

In the case, however, of a living fœtus in utero, no such difficulty can ever be encountered; and if there is a single instance within the whole range of Medicine in which implicit faith can be placed in any one physical sign to the exclusion of all others, it is to be met with in a female gone seven months with a healthy child.

Indeed there is no possibility of a mistake being committed here. How could there? with the maternal pulsations ranging from 60 to 80, and the fetal from 130 to 160 (for no one ever affirmed, until Dr. Adams did, that 160 double beats could be distinguished).

The sound of the fœtal heart can, by no stretch of imagination, no flight of fancy, no exercise of faith, no intensity of impression, be confounded with any other. It is a sound *per se*.

How strange, then, in Dr. Adams to maintain that "scarcely any person now-a-days pretends to hear the sound in question; or if a few still stand out for the old belief, you will not find two people who will give exactly the same account of what the nature of the sound was which they pretend to have heard."

How Naegelè, Kennedy, Montgomery, and Simpson would stare on being told that fetal auscultation is all a myth, and that the time they had devoted to it would have been as profitably employed had they been in the company of Dr. Adams gazing at the Northern Lights, and listening attentively for the crackling or hissing of the Aurora Borealis!

No one lays greater stress, in his class lectures, than Dr. Simpson on the value of fetal auscultation, especially when it comes to be a question whether the long forceps ought to be used to save the child, or the perforator to destroy it.

The truth is, my learned friend, from an examination of Hunter's plates, has come to the conclusion that the *placental soufflet* and fœtal pulsations ought not to be heard, and accordingly he can't and won't hear them.

Some men ridicule the idea of two sounds being heard over the region of the adult heart, because they have never been able to distinguish them; and at least one individual of my acquaintance maintains there is no such part of the uterus as the os uteri, because he never could satisfy himself as to its existence. "*Non credunt quia credere volunt.*"

But I must not trespass further on your valuable space in attempting to establish the truth of what scarcely any one at

the present day entertains a doubt—viz., that in almost every case of pregnancy after the seventh month, both the pulsations of the fetal heart and the *placental soufflet* can, with a moderate degree of care, be readily distinguished.

I am, &c.

WM. WILLIAMSON, M.D.

Physician to the Royal Infirmary, Aberdeen.

October 25.

HÆMORRHAGE IN TYPHOID FEVER.

[To the Editor of the Medical Times and Gazette.]

SIR,—In the last number of your Journal Dr. Markham calls attention to the fact, as maintained by Drs. Graves, Trousseau, and others, that hæmorrhage from the bowels is not so serious a complication as it is usually supposed to be. This opinion is, I find, confirmed by the very large experience of Dr. Ragaine, who has lately published a very valuable memoir on the "Epidemics of Typhoid Fever," observed by him at Moulins-la-Marche. Hæmorrhage from the bowels occurred in eleven of the 400 patients observed by him; and these eleven, every one of them, recovered.

I am, &c.

Sic.

REPORTS OF SOCIETIES.

THE PATHOLOGICAL SOCIETY.

TUESDAY, NOVEMBER 1ST, 1859.

MR. FERGUSSON, PRESIDENT, IN THE CHAIR.

Mr. BRYANT exhibited

A LARYNX SHOWING NECROSIS OF THE LARYNGEAL CARTILAGES.

Occurring in a woman, a patient of Dr. Rees, in Guy's Hospital. She was admitted with laryngeal symptoms, which became intense, accompanied by great hoarseness, urgent dyspnoea, and extreme difficulty in swallowing. Tracheotomy was performed, and gave great relief, but death followed from inanition fourteen days after the operation. The specimen showed œdema of the tissues about the glottis, and a large slough of the mucous membrane. The cartilages (including the cricoid part of which was unfortunately mislaid) were necrosed. There was no history of syphilis, and Mr. Bryant raised the question as to whether the disease arose in the cartilage from ossification and subsequent degeneration, or from inflammation. He inclined to the former opinion.

Mr. T. HOLMES related a case in which tracheotomy was performed, when the patient was dying of laryngeal disease. In this case the operator opened a large cyst connected with necrosed cartilage.

Dr. BRISTOWE thought the ossification was natural to the age of Mr. Bryant's patient.

Mr. BRYANT also exhibited a specimen of

MEDULLARY CANCER OF THE HAND,

Removed from a child, aged 1 year and 10 months. It was said by the mother to have commenced in the hand; but this Mr. Bryant doubted. It now was seen to involve all the metacarpal bones. The child did well after the operation. There was no history of immediately hereditary cancer; but the child's maternal grandparent had died of cancer.

Mr. SPENCER WELLS exhibited two

SPECIMENS SHOWING THE CONDITION OF PARTS NINE MONTHS AFTER OVARIOTOMY.

On the 5th of November, 1858, Mr. Wells removed a colloid tumour of the right ovary, weighing twenty-one pounds, which had been surrounded by fifty-seven pounds of ascitic fluid, from a patient 33 years of age. The tumour was exhibited at the Pathological Society on December 7. The woman recovered well, and left the Hospital a month after operation. She remained extremely well for several months, working in

the fields, but in July began to suffer from symptoms of chronic peritonitis, followed by those of obstructed intestine, and she died on the 26th of August. One specimen showed a portion of the abdominal wall, containing the cicatrix, the peduncle of the removed ovary adhering to it, and connecting it closely with the uterus; and the left ovary, in which disease had commenced and gone on to the formation of a compound cyst about the size of a small orange. Another specimen showed two strictures of the ileum, very near the cæcum, caused by cancerous deposit between the peritoneum and muscular coat of intestine. A similar deposit, in small nodules, had been strewn over nearly the whole of the peritoneum and its reflections. Mr. Jardine, of Capel, examined the structure of these nodules microscopically, and reported as follows:—"The masses are, when small, only between the peritoneum and the muscular coat of intestines, and have a distinct limiting membrane of their own; nowhere appearing to be infiltrating growths. As they increase, the general tendency seems to be to push out the peritoneum, and to become pedunculated rather than to spread flatly under it. The bulk is composed of cells about the size of pus corpuscles, with large nuclei (in some cases almost filling up the cells), refracting light more strongly than the cells themselves. Most of the cells approach the globular form, but many are fusiform and elongated. No nucleoli, but some oil-globules in cells, and nuclei, and much free oil; a small amount of fibrous tissue running throughout, but not with definite arrangement."

Mr. SPENCER WELLS also exhibited a

PSEUDO-COLLOID OVARIAN TUMOUR SUCCESSFULLY REMOVED BY OVARIOTOMY,

Which had been preserved by the petrifying process of Professor Raddi. It weighed ten pounds when removed, but had shrunk into a very small bulk after having been dried. It had been surrounded by upwards of forty pounds of ascitic fluid. At two previous tapplings, in March and May, forty-eight and forty-nine pounds of this fluid had been removed. The operation was performed on the 24th of May, and the patient left the Hospital within a month after the operation, and had since remained in good health. A stereoscopic photograph, by Dr. Wright, showing the very peculiar appearance of the abdomen, from the co-existence of ovarian tumour, ascites, umbilical hernia and varicose lymphatics, was also exhibited. The patient was 43 years of age.

Mr. SPENCER WELLS next exhibited an

OVARIAN CYST SUCCESSFULLY REMOVED BY OVARIOTOMY.

This had been emptied, stuffed, and dried. It had been removed from a patient, aged 29, on the 24th of June, who recovered well, and had since remained in good health. The tumour consisted of one large cyst, from which thirty-one and twenty-three pounds of fluid had been removed at two previous tapplings; and of a group of smaller cysts. It was the existence of this group which had led to the performance of ovariectomy instead of the injection of iodine.

Mr. SPENCER WELLS then presented

A COMPOUND OVARIAN CYST REMOVED BY OVARIOTOMY,

four days before the meeting from a lady, 38 years of age. With its contents it had weighed fifty-three pounds. It had grown within the last two years, and had been tapped by Mr. Whipple, of Plymouth, last August, when two quarts of fluid were removed; and again in September, when only half-a-pint of thick gelatinous matter came away. Mr. Wells succeeded in removing it through an incision only four inches long, by opening it (after separating some adhesions to the parietes and to a portion of omentum,) and breaking down the small cysts one after another with his hand, the cyst being withdrawn as it was emptied. The lady had gone on in a most satisfactory manner since the operation.

Mr. SPENCER WELLS also presented

A COMPOUND OVARIAN CYST REMOVED BY OVARIOTOMY,

just a week before the meeting, from a lady, 37 years of age, who had died four days after the operation. The walls of the principal cyst, which had contained nine pints of thick fluid, were very thick; and this had led to some difficulty in

diagnosis, especially as there was a very thick layer of fat in the abdominal parietes. The tumour was closely connected to the right side of the uterus, and a firm band of adhesion to the cæcum had to be tied and divided before the clamp could be applied. Scarcely any blood was lost, and the patient went on well until the third day, when bilious vomiting, and excessive distension of the intestines with gas, became very urgent, and she died of exhaustion. Mr. Wells added that he had removed nine ovarian tumours since the last specimen he had shown to the Society. He promised to exhibit the others at some early meeting; as he thought that, in the present unsettled state of Professional opinion with regard to ovariectomy, it was the duty of an operator to bring forward the whole of his cases, and not keep in the background any which had terminated unsuccessfully.

Mr. NUNN exhibited a specimen of

ATROPHY OF THE BLADDER AND VESICO-VAGINAL FISTULA.

The coats of the bladder were reduced to the thickness of parchment, the capacity of the organ being at the same time much diminished. The fistulous opening was of large size, extending from the neck of the bladder to the orifices of the ureters, the orifice of the left ureter being in the margin of the aperture, that of the right ureter only just within the vesical area. The vagina had been occluded, and two operations had been performed in consequence.

Mr. SPENCER WELLS asked Mr. Nunn if the occlusion referred to was not an effort of nature to remedy the defect in the bladder?

Mr. NUNN replied that an operation had been contemplated to make the posterior wall of the bladder take the place of the portion of the wall of the bladder lost by the disease. He did not think that the contraction of the vagina was due to any effort on the part of nature to form a receptacle for the urine, but that it had resulted from the same sloughing of tissues by which the fistula itself had been formed.

Mr. HEATH exhibited

A PYRIFORM PHOSPHATIC CALCULUS,

equal in bulk to a walnut, removed by incision from the bulbous portion of the urethra of a boy, from whom Mr. Partridge had removed a calculus by lithotomy five years ago. Notwithstanding the size of the calculus, the urine had been passed with comparative facility. He stated that Mr. Hussey, of Oxford, had sent him the particulars of a case of calculus, which had occupied a similar position, and had formed subsequent to lithotomy.

Mr. THOMPSON suggested that the calculus might have had its origin in phosphatic deposit in the wound during the week following the original operation.

Mr. HEATH replied that as the incision in the operation was in the membranous part of the urethra, and the calculus was in the bulbous, he could not believe that it had so originated.

Mr. THOMPSON did not think that the difference in the position at the time of removal was any reason why it should not have commenced higher up.

Dr. PRIESTLEY exhibited

THE ORGANS OF GENERATION,

removed from a female child, in whom the anterior wall of the abdomen, and front of the bladder had been congenitally wanting. The vagina was occluded, the mucous membrane of the posterior wall of the bladder had been habitually prolapsed externally, and the orifices of the ureters exposed to view. Dr. Priestley remarked on the comparative rarity of this lesion in female children.

Dr. PRIESTLEY also exhibited

A TUMOUR OF THE LABIUM.

It was removed by Mr. Spencer Wells by the écraseur. The woman had suffered from warts of the mons veneris and other neighbouring parts for some time. The irritation was great. The tumour contained serum, and was the sero-cystic tumour described by Madame Boivin. Dr. Priestley considered it to be analogous to elephantiasis of the scrotum.

Mr. THOMPSON mentioned that he had brought before the Society, during a previous session, a tumour he had removed from the labium, weighing about four pounds. In anticipation of the usual hæmorrhage, he had previously ligatured the

neck of the tumour, and thus prevented it. The patient was a prostitute, aged 50, and had vaginal discharge for years. In another case (also a prostitute) he had removed a tumour weighing half or three-quarters of a pound. There was no reproduction.

Mr. SPENCER WELLS stated that he had removed the tumour without the loss of one drop of blood. He had also removed a much smaller one from the right nympha by the écraseur, and there was some little hæmorrhage afterwards, one vessel requiring the ligature.

Dr. PRIESTLEY next exhibited

A CONCRETION PASSED BY THE INTESTINAL CANAL.

It consisted of undigested food, chlorophylle, spiral fibres, arterial tubes, etc. He stated that a female patient once brought to him at St. George's and St. James's Dispensary the testis of an animal, probably a pig, said to have been passed from the vagina. He stated that Mr. Quekett considers it not unusual for the arteries to pass undigested in the fæces.

Mr. P. PRICE now brought forward

PARTS REMOVED IN EXCISION OF THE KNEE-JOINT

Of a man from the country. He had had hæmoptysis, and there were also symptoms of serious mischief in the apex of one lung. Notwithstanding these symptoms, the suffering from the pain in the joint being severe, Mr. Price determined to remove the joint. The cartilages were destroyed, and the bone was somewhat hardened. Complete bony ankylosis resulted, and the patient recovered well. He also showed to the Society the head of the femur removed a few days ago for disease in a boy, aged ten years. The disease had existed for four or five years. Grating was felt under chloroform. He removed an inch of the femur, and also carious bone from the acetabulum. He also exhibited part of the lower limb, amputated below the knee for superficial ulceration and disease of the fibula, attended with severe pain. It had existed for some years. An operation had been previously performed for the sake of saving the limb, but without success, and in reply to a question, he stated that the disease was not syphilitic.

Dr. BRISTOWE exhibited

A HEART, IN WHICH THE VALVES WERE HEALTHY-LOOKING;

BUT IN WHICH DURING LIFE THERE HAD BEEN AUDIBLE OVER THE APEX A SYSTOLIC MURMUR, ORIGINATING PROBABLY IN THE TRICUSPID ORIFICE.

The heart on the whole was a little hypertrophied, weighing 11 ozs.; its left ventricle was small, and thin walled; its right much dilated and hypertrophied. He remarked that cases were not at all uncommon in which patients, manifesting during life symptoms of cardiac disease, attended by loud apical systolic murmur, were found after death to be labouring under hypertrophy of the organ, only without apparent valvular disease; but he added that in all such cases that had come under his own observation, while the left ventricle was dilated and its walls hypertrophied, the chordæ tendineæ and musculi papillares were not hypertrophied or elongated in a proportional degree, and that consequently they had evidently not permitted perfect closure of the mitral valve during the systole,—leaving it, in point of fact, though apparently healthy, decidedly incompetent. In the case under consideration, this explanation could not hold good as regards the left side of the heart. But all those circumstances when detailed which conspire frequently to render the mitral valve unsound, had here operated apparently on the right side; and his belief was, therefore, that the murmur had been engendered at the tricuspid orifice, on the principle above enunciated. The heart was taken from a young man, 24 years of age, who had angular curvature of the spine. He had suffered from small-pox a few months ago; during convalescence from which he had become anasarctous, and had acquired a dry cough, great dyspnoea, lividity of countenance, and other symptoms suggestive of bronchial inflammation, or of cardiac disease. The murmur was distinct and loud during the whole time of his sojourn in the Hospital—a period of two weeks.

Mr. FERGUSON brought before the Society a specimen of parts removed in

EXCISION OF THE SHOULDER-JOINT.

We have mentioned this case in our Hospital Reports for this week, and need not, therefore, repeat its details. A short discussion followed as to the importance of saving the long head of the biceps when excising the head of the humerus, Mr. Spencer Wells stating that Langenbeck had done so with good result in the Schleswig-Holstein war. Mr. Wells added that it was easy to save the tendon in the dead subject, but Mr. Fergusson thought it was of no great importance in the living.

UNIVERSITY OF ST. ANDREWS.

MEDICAL EXAMINATION PAPERS.—OCTOBER, 1859.

First Examination.—FIRST PART.

Translation of a Latin paragraph into English.

Give the derivations or primary meanings of the following words:—Anthropoid, Arachnoid, Diabetes, Entozoa, Epigastria, Hernia, Melanosis, and Paralysis.

First Examination.—SECOND PART.

CHEMISTRY.

1. What is ammonia? State its properties, composition, and mode of preparation. Give tests for ascertaining its presence.
2. State the composition, mode of preparation, properties of, and tests for oxalic acid.
3. How is nitric acid prepared?
4. What are the tests for hydrocyanic acid?

MATERIA MEDICA AND THERAPEUTICS.

1. Write short essays on the following subjects:—
a. The medicines and other remedial means employed to procure diaphoresis.
b. The medicinal use of opium and its preparations.
2. Describe the preparations of mercury which are used internally, and mention the cases in which they are specially applicable.
3. Write a Latin prescription (without using symbols or abbreviations) for a mixture suitable for a case of English cholera; also for a dozen pills for a similar case.

Second Examination.

ANATOMY AND PHYSIOLOGY.

1. Describe the muscles which form the anterior and lateral walls of the abdomen; and point out the bearings of the anatomy of certain of these muscles upon the subject of hernia.
2. Describe the distribution of the arteries in the foot.
3. Describe the portion of the ganglionic nervous system which lies in the cervical region, and state what you know regarding the results of experiments made upon the cervical ganglia and their branches.
4. What are the uses of the fat which occurs in the animal body? State what you know regarding its origin.

Third Examination.

N.B.—In answering the practical questions, the examiners require every candidate to specify the mode of treatment which he is in the habit of adopting, and the doses of medicines which he prescribes.

PATHOLOGY AND PRACTICE OF MEDICINE.

1. State the symptoms, diagnostic characters, and prognosis of the various kinds of jaundice.
2. Distinguish the following auscultatory phenomena, and remark upon the special significance of each,—viz. bronchial respiration, aegophony, pectoriloquy, metallic tinkling, gurgling, crepitation.
3. Mention some of the principal remedies for tape-worm, with full directions for their administration; and state what you know of the preventive measures that should be adopted when the disease is endemic.
4. Describe minutely the course of a case of scarlet fever, followed by dropsy, together with the treatment which you would adopt in such a case.

Fourth Examination.

SURGERY.

1. Explain the nature and symptoms of cataract; the

diagnosis between it and amaurosis in an early stage; and the different operations suitable for the various kinds.

2. Give an account of the causes, symptoms, and varieties of erysipelas; of the sources of danger in this disease, and of the principles on which it is to be treated.

MIDWIFERY.

1. What are the different forms of dysmenorrhœa, the symptoms diagnostic of each, and the appropriate treatment?

2. What are the causes of puerperal convulsions, with what visceral disorder are they often connected, and how are they to be foreseen, prevented, and treated?

Fifth Examination.

CASES.

1. An intemperate man, long in bad health, and subject to attacks of diarrhœa, is brought into Hospital in an exhausted and emaciated condition, the bowels being still relaxed. The diarrhœa is painless, and there is no tenesmus; the dejections are liquid without slime or blood. The urine is scanty, specific gravity 1006; it contains a small amount of albumen. In the course of treatment by astringents and iron, the patient becomes first listless, then comatose; there is no paralysis; the pupils remain sensible to light, and are neither dilated nor contracted. The tongue is dry and brown: surface cold, no trace of fever. Finally a succession of epileptiform convulsions occurs, and the patient dies.

What is the true pathology of this case? Remark on each of the symptoms, and state what you would expect to find, on examination of the body, in the head, thorax, and abdomen.

2. A gentleman, in affluent circumstances, and of rather luxurious habits, is occasionally affected with twinges of pain about the loins, and has once or twice passed small calculi. This has led to the frequent examination of the urine, which contains three distinct sediments, sometimes separate, sometimes mingled together, viz.:—

a. An amorphous, coloured sediment, soluble on heating the urine:

b. Crystals freely soluble in liquor potassæ:

c. Colourless crystals soluble in all the mineral acids without effervescence (the urine being highly acid):—

Describe these sediments more minutely, so as to show your acquaintance with their characters; and give your views at large on the subject of treatment.

3. A woman, a month after her confinement, having previously had a good deal of uterine uneasiness, began to complain of hypogastric pain, forcing her to stoop while walking. It was very soon accompanied by swelling across the lower part of the abdomen, which felt firm to the touch, and was excessively tender. On examination, per vaginam, the uterus was found elevated and fixed; while the pelvis was to a considerable extent occupied by an ill-defined tumefaction of a firm, brawny character. The patient suffered from frequent rigors, and copious perspirations; her stomach was very irritable, her exhaustion great, and there were from time to time attacks of very violent hypogastric pain.

What was the nature of this disease, its probable progress, and ultimate result, and what the appropriate treatment?

MEDICAL BENEVOLENT FUND.—At a meeting of the Committee, held October 25, in New Burlington-street, Wm. Newnham, Esq., Vice-President, in the chair, seven cases for relief were presented to the meeting, five of which were relieved, besides granting four additional annuities of £20 each.

At a Meeting of the Norfolk and Norwich Medical Registration Association, held at the Hospital on November 1, 1859, Dr. Ranking, President, in the chair, the following resolutions were unanimously agreed upon:—1. That a fund be established to enable the Registration Association to carry into effect the recent Medical Act with respect to the prosecution of illegal practitioners. 2. That each member of the Association be requested to contribute the sum of ten shillings for the purpose of carrying into effect the foregoing resolution. 3. That every registered member of the Profession in this district be solicited to contribute, either by donation or subscription, towards the objects of the Association. 4. That a sub-committee be appointed, consisting of the President, Secretaries, and five other members, to make all necessary arrangements.

MEDICAL NEWS.

ROYAL COLLEGE OF PHYSICIANS.—The following gentlemen were on October 19, elected Members of the Royal College of Physicians of London:—

BLACK, CORNELIUS, Chesterfield
BRYSON, ALEXANDER, Hermitage, Barnes
BURDER, GEORGE FORSTER, 7, South Parade, Clifton
CASTENEDA, MICHAEL, 162, Albany-street
CAMPS, WILLIAM, 40, Park-street, Grosvenor-square
CHRISTIE, THOMAS BEATH, Pembroke House, Hackney
CHEVALLIER, BARRINGTON, The Grove, Ipswich
COLLUM, ROBERT, 1, Chester-place, Hyde-park-square
COOPER, CLARENCE, H.M. Madras Service
COPEMAN, EDWARD, Norwich
COOPER, SIR HENRY, Knt., 7, Charlotte-street, Hull
DAVIES, THOMAS, Whitefriars, Chester
DAVIS, WILLIAM, 10, Gay-street, Bath
DAVIS, JOHN, 24, Wilson-street, Bristol
DUFFIN, ALFRED BAYNARD, 14, Langham-place
DUKE, ABRAHAM, Bilton-road, Rugby
DYMCK, ARCHIBALD, Louth, Lincolnshire
FOX, EDWARD LONG, 10, Berkeley-square, Bristol
GURNEY, HENRY CECIL, Nice, Sardinia
HIGGINS, CHARLES HAYES, Cloughton, Birkenhead
HODGES, EDWARD, 19, Gay-street, Bath
JEPHSON, JOHN HOLMES, 1, Conduit-street West, Hyde-park
KEBBELL, WILLIAM, 7, Upper Brunswick-place, Brighton
KITCHING, GEORGE, Enfield, Middlesex
KINGLAKE, HAMILTON, Taunton, Somerset
LEWIS, THOMAS, 19, University-street, University College
LUND, GEORGE, Funchal, Madeira
MAXWELL, WILLIAM BROOK CHARLES, Winchelsea
PAINE, WILLIAM HENRY, Stroud, Gloucestershire
PAUL, JOHN HAYBALL, Camberwell House
PHILLIPS, HENRY JOHN, 22, Kensington-gate
PICKSTOCK, GEORGE NEWPORT, Paignton, Devon
RANSOM, WILLIAM HENRY, Nottingham
RANKIN, WILLIAM HARCOURT, Norwich
ROBERTSON, WILLIAM HENRY, Buxton
ROBERTSON, JOHN, Sudbury, Suffolk
ROE, WILLIAM HAMILTON, 57, Park-street, Grosvenor-square
ROGERS, WILLIAM RICHARD, 56, Berners-street
ROSS, ANDREW, Waterloo, near Portsmouth
SCOTT, WILLIAM, Huddersfield
SMART, THOMAS WILLIAM WAKE, Northiam, Sussex
SPENCER, JOHN, 17, Regent's-park-terrace, Regent's-park
STANTON, JOHN, 7, Upper George-street, Bryanston-square
STEVENS, HENRY, St. Luke's Hospital
TUNSTALL, JAMES, 35, Brook-street, Bath
WADE, WILLOUGHBY FRAS. 16, Temple-row, Birmingham
WANE, DANIEL, 20, Grafton-street, Berkeley-square
WILFRET, EDM. SPARSHALL, Wyke House, Zion-hill, Isleworth
WILSON, EDW. THOMAS, Hen Castle, nr. Tenby, Pembrokeshire
WOLLASTON, ROBERT, Cheltenham
WYNTER, ANDREW, Colehorne-court, Old Brompton

ROYAL COLLEGE OF SURGEONS.—The following gentlemen, having undergone the necessary Examinations for the Diploma, were admitted Members of the College at a meeting of the Court of Examiners on October 28:—

ANTROBUS, DANIEL, Talk-on-the-Hill, Staffordshire
AYRE, JOSEPH BROCKWAY, Tottersidge, near Barnet
BARLOW, ROBERT, Queen's-road, Dalston
BROMLEY, HENRY, Rippingall, Lincolnshire
BUTLER, WILLIAM, Chapel-street, Islington
CHEETHAM, SAMUEL HOWARD, Stockport, Cheshire
EDWARDES, DAVID, Great Russell-street, Covent-garden
FENDICK, ROBERT, Bristol
FURNER, CHARLES, King's-road, Brighton
HALLOWS, JOHN SHARPLES, Liverpool
HORTON, GEORGE EDWARD, Dudley
HOWSE, WILLIAM, Burford, Oxon
JACOBSON, THOMAS EDMUND, Sleaford, Lincolnshire
JACKSON, GEORGE HENRY, Lower Tottenham
JEFFS, ROBERT SMITH, Lisson-grove
KEMPSTER, FELIX HENRY, Euston-square
LEVICK, CHRISTOPHER KENNY, Stratford, Essex
MILLIN, EDWARD HENRY, Coventry
MYERS, ARTHUR BOWEN RICHARDS, Army
OLIVE, GEORGE, Northampton
PAYNE, CHARLES WILLIAM, Hoxne, Suffolk
PEPLOW, JOSEPH, Great Russell-street, Bloomsbury
RAMSAY, JOHN ALEX, Great Shelford, Cambridgeshire
RYGATE, JOHN JAMES, London
SOMERVILLE, CHARLES, Bloxwich, near Walsall
STARKE, ANTHONY GEORGE HAYDEN, Honiton, Devon
STEVENS, WILLIAM, Maude-grove, Fulham-road
TREND, THEOPHILUS WILLIAM, Bridgewater
TUBES, WILLIAM JOHN, Upwell, near Wisbeach
WEBSTER, JOSEPH, Golcar, near Huddersfield
WILLIAMS, WILLIAM PRICE, Wellington-road, St. John's-wood

APOTHECARIES' HALL.—Names of gentlemen who passed their Examination in the Science and Practice of Medicine, and received Certificates to Practise, on Thursday, the 27th October:—

COLBECK, THOMAS WILLIAM.
GRIFFITH, ROBERT, Carnarvon, North Wales.
JOHNSON, JOSEPH, Hogsthorpe, Lincolnshire.
MAY, JOSEPH, Stoke Damerel, Devonshire.
WILDERS, JOHN ST. SWITHIN, Queen's Hospital, Birmingham.

The following gentleman also on the same day passed his First Examination:—

DRAKE, THOMAS, Kingsclere, Hants.

UNIVERSITY OF ST. ANDREWS.—Honorary Examination in Medicine.—First Class.

BLOXAM, WILLIAM, M.D., Duke-street, Grosvenor-square, Lecturer on Midwifery at the School of Medicine, Grosvenor-place.

APPOINTMENTS.

GARNER—CANDY.—On October 5, Mr. John Garner was appointed Junior Resident Surgeon to the General Dispensary, Birmingham, *vice* Mr. F. J. Orford resigned, and Mr. John Candy was elected on the 19th of October, Resident Surgeon-Accoucheur, *vice* Mr. Garner.

DEATHS.

BURKE.—Recently, Thomas Burke, Assistant-Surgeon, 27th Foot, half-pay.
HAIRBY.—October 30, at his residence, Marlborough-place, Walworth-road, Mr. William Hairby, aged 66.
JONES.—October 23, at Liverpool, John Julius Jones.
KIRK.—October 17, at 67, Lower Leeson-street, Dublin, Thomas Kirk, M.R.C.S.I., aged 64, for many years resident at Shanghai, China.
MALCOLM.—October 30, at Rose-terrace, Perth, William Malcolm, M.D., H.B.C.S.
MANSELL.—October 23, at the Royal Naval Hospital, Haslar, Fitzwilliam Mansell, M.D., B.A., Deputy Inspector-General of Hospitals and Fleets, aged 50.
MILLAR.—October 31, at 9, King-street, Finsbury-square, James Cochrane Millar, L.R.C.P. Edin.; F.P.S. Glasg.; M.R.C.S. Eng.; aged 60.
WILLIAMS.—October 15, at Guy's Hospital, Humphrey Williams, aged 23.
WRIGHT.—October 26, lost in the wreck of the *Royal Charter*, of which he was Surgeon, Joseph Hiles Wright, aged 21.

M. DE LUCA still positively denies the presence of iodine in the air and in well-waters.

CAMBRIDGE.—On the 27th October David Hinckley Hodgkinson was made a Doctor of Medicine.

DR. W. W. JOHNSTON, who has recently returned after practising fourteen years in Java, had a service of plate worth £700 presented to him on leaving the country.

THE Liberal Association of Glasgow has determined to give its support to Lord Elgin as a candidate for the Lord Rectorship at Glasgow University at the ensuing election.

THE widow of a Druggist, at Shadwell, has been committed to take her trial for murder, on a charge of procuring abortion. We shall not say more of the case before the trial.

YELLOW FEVER broke out on board the "La Plata" in the harbour of St. Thomas, and raged fearfully on her passage home. Fourteen of the crew have died since leaving St. Thomas.

PROFESSOR VON LENHOSSEK.—This distinguished anatomist has received a "call" from Klausenberg, in order that he may fill the important chair of Anatomy at the University of Pesh.

ONE USE OF THE MILITARY STOCK.—A Soldier was last week suffocated by his stock in a railway train. He was drunk, and falling down to the bottom of the carriage was strangled by the pressure of this absurd representation of red-tape wisdom.

MEDICAL EDUCATION IN THE DUBLIN SCHOOL OF MEDICINE.—The friends of progress will be glad to learn that, at a meeting of the Fellows of the Royal College of Surgeons, held pursuant to requisition at the College-hall, a resolution, recommending the Council to reciprocate the good feeling already expressed by the University, with respect to the interchange of certificates, was carried by a large majority. This vexed question has again to be referred to the Council of the College of Surgeons.

GASTROTOMY.—This operation, first proposed by Sédillot in 1846, has been performed five times. Twice by Sédillot (*Traité de Méd. Opér.* t. ii. p. 272), once by M. Senger of Copenhagen (*Archiv. für Path. Anat.* b. vi. p. 350), twice by Mr. C. Foster, and once by Mr. S. Jones.—In no case has the patient survived.

PRIZE QUESTION.—The Medico-Chirurgical Society of Amsterdam offers a gold medal, 30 ducats in value, for the best Physio-Pathological and Therapeutical Dissertation on Scoliosis. The Society especially desires detailed researches on the action of the muscles which give rise to the scoliosis; as also of those which, opposed to the former, may correct the direction of the spinal column. It also desires precise indications of the various movements, whether active or passive, requisite to induce muscular action in the last-named direction; and of the manner in which such action can be excited by electricity. Essays, written in Dutch, French, English, or Latin, to be forwarded to the Secretary, Dr. Titanus, before May 1, 1861.

HEREFORDSHIRE MEDICAL ASSOCIATION.—This Society held the annual meeting on Friday, the 28th ult., at the Hereford Infirmary. In the absence of their respected president, Dr. Bleeck Lye, the chair was ably filled by Dr. Gilliland. The members assembled from all parts of the county, and some from Monmouthshire who were desirous of joining the Association. After a most cordial and unanimous meeting, at which resolutions were passed of interest to the Profession, and the Committee reported their proceedings for the past year, the members adjourned to the Mitre Hotel, where they partook of an excellent dinner. The meeting broke up at an early hour, and the members took leave of each other, much gratified by the social and friendly spirit that prevailed throughout the day, and the prospect of advantage held out by these annual gatherings, both to the Profession and to the public in general.

VITAL STATISTICS OF LONDON.

Week ending Saturday, October 29, 1859.

BIRTHS.

Births of Boys, 823; Girls, 822; Total, 1645.
Average of 10 corresponding weeks, 1849-58, 1563.5.

DEATHS.

	Males.	Females.	Total.
Deaths during the week	543	505	1048
Average of the ten years 1849-58	524.1	498.8	1022.9
Average corrected to increased population	1125
Deaths of people above 90	3
Deaths in 15 General Hospitals	34	28	62

TO CORRESPONDENTS.

A most interesting paper "On the African Fever on the Lower Zambesi," by Dr. Livingstone and Dr. Kirk, will appear next week.

Dr. Ogle's letter arrived too late for insertion this week.

Dr. Adams, *Banchory*.—No such note was sent. The request shall be attended to.

An *Inquirer*.—We cannot decide upon a point which has not yet been settled either by the Medical Council or any Court of Law.

ARE APOTHECARIES SURGEONS?

TO THE EDITOR OF THE MEDICAL TIMES AND GAZETTE.

SIR,—I, for one, have paid my two Guineas for Medical Registration, and find many, holding only the Licence of the Apothecaries' Society, affixing the word Surgeon upon the brass plates of their doors, with impunity. I wish to know, Sir, if the law can force these gentlemen to take out their borrowed title?

I am, &c. M.R.C.S.

DISINTERESTED BENEVOLENCE.

TO THE EDITOR OF THE MEDICAL TIMES AND GAZETTE.

SIR,—Perhaps you have not seen the following, taken from the *Daily News* of November 3.

"Our nervous readers, whose troubles may be traced to indigestion, would do well to enclose a directed envelope to the Secretary of the Medical Reform Society in Nottingham, who will send post free the new

and eminently successful remedy discovered by Professor Webster, of Philadelphia. No fee or gratuity under any circumstances accepted, and it is not requisite that poor applicants should enclose a stamp."

Perhaps some of your readers, more nervous than I am, will accept this benevolent invitation, and try their luck. I am, &c. C. R.

THE TWO COLLEGES.

TO THE EDITOR OF THE MEDICAL TIMES AND GAZETTE.

SIR,—Permit me to ask through the medium of your Journal,—On what grounds do the Royal College of Physicians of London, continue to grant their Diplomas without examination, in direct violation of the resolution of the Medical Council?

The Edinburgh College ceased to do so immediately upon the passing of the resolution, why did not the London College do the same, as there was no exception in favour of Graduates?

It seems, however, that what is wrong in one College, is quite right in the other; and that it is not wrong to make a Physician out of a M.D., but very much so out of a Surgeon or an Apothecary.

I am, &c. JAS. GAGE PARSONS, L.R.C.P. Edin.

73, Old Market-street, Bristol.

ST. ANDREWS' GRADUATES.

TO THE EDITOR OF THE MEDICAL TIMES AND GAZETTE.

SIR,—Now that the excitement attending the recent election of Chancellor of the University of Edinburgh has passed away, the public attention, or, at least, the attention of Medical men generally, may be directed to the fact that large numbers of the Medical Graduates of Scotland are excluded from taking any part in the Government of their respective Universities. I take the opportunity of suggesting, through you, to the secretary of the Association of St. Andrews' Graduates, the propriety of taking some steps towards obtaining such a change in the qualifications demanded of electors, as will admit this large and respectable body of Medical Graduates to a share in the government of a University of which they form so very great and important a proportion.

I am, &c. WM. DEAN FAIRLESS, M.D. St. Andrews.

Royal Asylum, Montrose, October 29.

THE TITLE OF DOCTOR.

TO THE EDITOR OF THE MEDICAL TIMES AND GAZETTE.

SIR,—Notwithstanding my expressed intention not to encroach again on your columns, I must request the favour of a reply, through your medium, to the remarks of Mr. Stokes. I beg leave to inform that gentleman that my observations had no reference whatever to Army, Navy, or Country Surgeons; but to *bona fide* Physicians, Licentiates of the Colleges of Physicians, Doctors by long-established usage and courtesy. Pray would your correspondent deny his title to Lord John Russell, or that of Reverend to the Clergyman of his parish, because their titles are not confirmed by Charter or Act of Parliament? The Physician claims the title of Doctor precisely on the same principle. It is not a "cognomen set up by him for himself," but one which has been accorded to him for a lapse of years by the Profession and the Public. Hence the assertion, that its assumption is "empirical" turns out to be evidently erroneous. The premises being wrong the conclusion must be incorrect, and consequently Mr. Stokes' argument falls to the ground.

I am, &c. JOHN E. SMYTH, B.A., L.R.C.P.E.

2, China-terrace, Lambeth, October 31st, 1859.

EDINBURGH GRADUATES.

TO THE EDITOR OF THE MEDICAL TIMES AND GAZETTE.

SIR,—Will you be kind enough to inform me, if you are able, whether or no all Graduates of the University of Edinburgh have a right to vote at the Election of Chancellor of the University? I have enquired of several Graduates of Edinburgh University, but have not yet been able to learn whether or not I, as a Graduate of Edinburgh University, have a vote at such Election.

I am, &c.

M. D. Edin.

[Any Master of Arts, or Doctor of Medicine of the University with four Sessions' attendance, or any Student who has attended four Sessions in the University, can register as Member of Council, and thus become entitled to vote.]

THE EDINBURGH LICENCES AND THE TITLE OF "DOCTOR."

TO THE EDITOR OF THE MEDICAL TIMES AND GAZETTE.

SIR,—Permit me, as one interested in the matter, to offer a few remarks on the above *quæstio vocata*. A question which has, I fear, been discussed with more acrimony than reason, in consequence possibly of jealousy on the one side and too great susceptibility on the other.

When the Edinburgh College of Physicians made known its intention of admitting Medical men of a certain standing, as Licentiates, I hailed it as a step in the right direction, because calculated to raise the General Practitioner above the name and status of "Apothecary." Still I cannot but think it was unwise to offer the Licence to any one without a special examination, or a University Degree, as provided for in the College by-laws. But now that an examination is required, (a practical but by no means a trivial or a superficial one,) I imagine every unprejudiced and unexcited person will admit that a Licentiate of the Edinburgh College is entitled to equal privileges and distinctions with a Licentiate, or extra-Licentiate, of the London College; or at all events that legally such is the case.

Now, ungraduated Licentiates and extra-Licentiates of the London College have always, in courtesy, been styled "Doctors" by their *confrères*, although more frequently acting as General Practitioners and family Medical men, in the country certainly, than as consulting Physicians. I am of opinion then that, acting on his own defence against the somewhat rude attacks of his opponents, it behoves every Licentiate of the Edinburgh College to call himself by some distinctive title different from that of "Surgeon" or "Apothecary," and what title is more appropriate than the one universally conceded to those Practitioners who hold precisely the same position in connexion with the London College?

To conclude, I cannot think there is either truth or justice in the insinuation, that the ungraduated Edinburgh Licentiates, by calling themselves "Doctors," wish to mislead the public into considering them M.D.'s of any University. I believe nine out of ten at least are quite satisfied with being understood to be simply what they are—"Physicians," a title their right to which, I take it, no special pleading will be able to subvert.

I am, &c.

HUGH NORRIS.

South Petherton, Somerset, October, 1859.

DR. BARKER AND MR. CHAVASSE.

As we have published the Protest, we publish the following Reply; and here, we trust, the matter will rest:—

"To the Medical men of Birmingham who signed the Protest which appeared in the *Medical Times and Gazette* (page 446) of October 29, 1859.

"GENTLEMEN,—In consequence of the very extraordinary course pursued by Mr. Chavasse, I beg to trouble you with a few lines.

"During the past summer, and while I was in Switzerland, Mr. Chavasse, through his solicitor, demanded the immediate suppression of the sale of my work on the 'Hygienic Management of Infants and Children,' in consequence, as was alleged, of some 'very valuable parts' of his work having been printed by me. My wife informed him of my absence on the Continent, and that immediately on my return it should be attended to. He directly, through his solicitors, replied to Mrs. Barker that the injury being done to him was so considerable, that she must not wait until my return, but at once put the matter into the hands of my solicitor.

"This was a most unheard-of and unwarrantable mode of proceeding, even were it towards a man alone and an entire stranger, but—towards a friend who had been upon terms of more than friendly correspondence, and towards the wife of a friend, not to be characterised by any terms with which I am acquainted.

"This is the key to the whole affair.

"I denounced his conduct at the first, and from the first, and if I have done it in terms which are not quite palatable to my opponent, I plead his excessively annoying mode of procedure.

"The 'appropriations,' and his disingenuous style of proving them, I most unhesitatingly repudiate. Moreover, I solemnly declare, that I have never seen several of the pages in his work which have been referred to.

"I deeply regret that, in any way, you should have been mixed up with this silly squabble, and am entirely at a loss to conceive upon what grounds you are of opinion that I have offered an insult to the Medical Profession of Birmingham.

"I assure you, Gentlemen, that I had not the slightest intention, in thought, word, or deed, to insult you, collectively or individually, and that I entertain the highest respect for every one of you.

"In conclusion, I beg that you will accept my most unequivocal apology for anything which may have inadvertently escaped my pen which can possibly bear a shadow of the construction you have put upon it.

"I have the honour to be, Gentlemen,

"Your Obedient and Humble Servant,

"T. HERBERT BARKER, M.D. (Lond.) F.R.C.S.

"Bedford, October 31, 1859."

COMMUNICATIONS have been received from:—

SIR JAMES CLARK, Bart.; DR. LIVINGSTONE; DR. KIRK; PROFESSOR SIMPSON; DR. RAMSBOTHAM; DR. WEST; MR. TEALE, Leeds; MR. HILTON; MR. HAYNES WALTON; DR. PEACOCK; DR. CUTBERT; MR. CROSSE, Norwich; DR. OGLE; MR. NUNN; MR. MICHELL; DR. LADD; DR. HALFORD; DR. ADAMS; DR. FAIRLESS; DR. WHITEHEAD; MR. VINCENT; REGISTRAR GENERAL; MR. GARNER; DR. PARSONS; MR. CANDY; MR. SELF; MR. MACFEE.

APPOINTMENTS FOR THE WEEK.

November 5. *Saturday (this day).*

Operations at St. Bartholomew's, 1½ p.m.; St. Thomas's, 1 p.m. King's, 2 p.m.; Charing-Cross, 1 p.m.

7. Monday.

Operations at the Royal Free Hospital, 1 p.m.; Metropolitan Free Hospital, 2 p.m.

EPIDEMIOLOGICAL SOCIETY, 8 p.m. Dr. Richardson "On the Theory of Zymosis."

MEDICAL SOCIETY OF LONDON, 8 p.m. General Meeting.

ROYAL INSTITUTION, 2 p.m. General Monthly Meeting.

8. Tuesday.

Operations at Guy's, 1 p.m.; Westminster, 2 p.m.

ROYAL MEDICAL AND CHIRURGICAL SOCIETY, 8½ p.m. Mr. Solly's Case of "Attested Aneurism of the Abdominal Aorta." Dr. R. Lee's Additional Case of "Pupal Gestation."

9. Wednesday.

Operations at University College Hospital, 2 p.m.; St. Mary's, 1 p.m. Orthopaedic Hospital, 2 p.m.; Middlesex, 1 p.m.

NORTH LONDON MEDICAL SOCIETY, 8 p.m.

10. Thursday.

Operations at St. George's, 1 p.m.; Central London Ophthalmic, 1 p.m.; London, 1½ p.m.; Great Northern, 2½ p.m.

11. Friday.

Operations, Westminster Ophthalmic, 1½ p.m.

EXPECTED OPERATIONS.

Westminster Hospital.—The following operations will take place on Tuesday next, at 2 o'clock:—

Mr. Holt—Stricture of Urethra (3 cases). Mr. Brooke—Necrosis of Tibia. Mr. Hillman—Restoration of Female Perineum.

Pepsine.—M. Boudault begs to state that he cannot be answerable for the purity and strength of any Preparation sold under his name unless obtained from his sole Agent, Mr. PETER SQUIRE, Her Majesty's Chemist, 277, Oxford-street, London, to whom all applications respecting it must be addressed.

Second Edition of Boudault on "Pepsine," with Remarks by English Physicians. Edited by W. S. SQUIRE, Ph. D., published by J. Churchill, London, may be also had of the Author, 277, Oxford-street, price Sixpence.

Great Reduction in the Prices of New

MEDICAL GLASS BOTTLES and PHIALS, at the Islington Glass Bottle Works, Islington-place, Park-road. London Warehouses, 19, Bread-street-hill, near Thames-street, City, E.C., and 2, Upper Copenhagen-street, Barnsbury-road, Islington. E. and H. HARRIS and CO. Proprietors.

6 & 8 oz., any shape, plain or graduated	clear	8s. per gross.
3 & 4 oz., do.	blue tinted	7s. 6d. do.
1 oz. white moulded phials	do.	4s. 6d. do.
1 oz. do. do.	of a very	5s. 6d. do.
1½ oz. do. do.	superior	6s. do.
2 oz. do. do.	quality.	7s. do.

Immediate attention to country orders. No remittance required until the goods are received. Packages free. Goods delivered free within 7 miles. Post-office orders made payable to E. and H. HARRIS and Co., at the Chief Office, London. Bankers: Union Bank of London.

N.B.—Orders sent to either Establishment will have prompt attention.

Varicose Veins and Supporting Bands.

—SURGICAL ELASTIC STOCKINGS AND KNEE CAPS, pervious, light in texture, and inexpensive, yielding an efficient and unvarying support, without the trouble of lacing. Likewise, a strong low-priced article for Hospitals and the Working-Classes. ABDOMINAL SUPPORTING BANDS for both Sexes; those for Ladies' use, before and after accouchement, are admirably adapted for giving adequate support with extreme lightness—a point little attended to in the comparatively clumsy contrivances and fabrics hitherto employed. Instruction for measurement and prices on application, and the articles sent by post from the Manufacturers and Inventors, POPE and PLANTE, 4, Waterloo-place, Pall-mall, London, S.W.

The Profession, Trade, and Hospitals, supplied.

Mr. Howard, Surgeon-Dentist, 52,

FLEET-STREET, has introduced an entirely NEW DESCRIPTION of ARTIFICIAL TEETH, fixed without Springs, Wires, or Ligatures. They so perfectly resemble the natural teeth as not to be distinguished from the original by the closest observer; they will NEVER CHANGE COLOUR or DECAY, and will be found very superior to any teeth ever before used. This method does not require the extraction of roots, or any painful operation, and will give support and preserve teeth that are loose, and is guaranteed to restore articulation and mastication; and that Mr. Howard's improvements may be within the reach of the most economical, he has fixed his charges at the lowest scale possible. Decayed Teeth stopped and rendered sound and useful in mastication. 52, Fleet-street. At home from Tentill Five.

Superphosphate of Iron and Super-

PHOSPHATE OF IRON and LIME. New Remedial Agents introduced to the notice of the Profession at the Meetings of the Medical Society of London, and now extensively employed by the most eminent members of the Medical Profession. The Syrup is the most eligible mode of administering these valuable Remedial Agents. Mr. GREENISH will be happy to forward a variety of cases which have been furnished to him, where its success has been most marked, and which will serve to indicate where it may be most advantageously employed.—20, New-street, Dorset-square.

Important Saving, by Prepayment,

in the PURCHASE of NEW WHITE ROUND MOULDED VIALS of the BEST QUALITY. PELLATT and Co. submit the following PRICES of VIALS, for PREPAYMENT only:—

3 oz., 1 oz., 10 dr., and 1½ oz. per Gross, 6s.	In quantities of not less than
14 dr., and 2 oz. 7s.	Six Gross, assorted to suit the
3 oz. 8s.	convenience of the purchaser,
4 oz. 10s.	delivered to carriers in London.
6 oz. 15s.	No charge for Package.
8 oz. 18s.	Breakage at risk of Pur-
3 oz. graduated in 3 doses, .. 12s. 6d. chaser.	

The above Prices being based upon a calculation which excludes all charges whatever between the Manufacturer and the Consumer, no attention can be paid to any order not accompanied by a remittance in full, made payable in London.—P. and Co. do not supply Green Glass.—Orders and remittances to be addressed,

PELLATT & Co.,
FALCON GLASS WORKS, LONDON.

Great Saving in the Purchase of New

MEDICAL GLASS BOTTLES and PHIALS at the NORTH LONDON GLASS BOTTLE WORKS, ISAACS and SON (Proprietors).—London Warehouses, 24 and 25, Francis-st., Tottenham court-road, W.C.

6 and 8 oz., any shape, plain, or graduated	clear	8s. per gross.
3 and 4 oz. ditto	blue tinted	7s. 6d. do.
1 oz. Moulded Phials do.	of a very	4s. 6d. do.
1 oz. ditto do.	superior	5s. 6d. do.
1½ oz. ditto do.	quality.	6s. 0d. do.
2 oz. ditto do.		7s. 0d. do.

A remittance not required till the goods are received. Packages free. Delivered free within seven miles. Post-office Orders payable to "S. Isaacs and Son," at Tottenham-court-road. Bankers: Unity Bank.

Pillischer's Achromatic Microscopes.—

To meet the daily increasing demand for his Microscopes, M. PILLISCHER has recently completed extensive alterations in his workshops to enable him to manufacture MICROSCOPES and their Object Glasses upon a more expeditious and extensive scale. M. P. has the pleasure of informing the Profession that he is now able to furnish Microscopes of the very greatest perfection; possessing every modern improvement; and with Object Glasses of a quality unsurpassed by any other maker, on the shortest notice, and at very moderate prices.

PILLISCHER'S £7 7s. STUDENTS' MICROSCOPE, for which a Prize Medal was awarded to him at Paris Exhibition, 1855, deserves particular notice. It consists of a well-constructed Stand, with coarse and fine adjustments, a capital Stage, with Diaphragm and Large Mirror, one Eye-glass, one and one quarter inch Object Glasses, 16" and 75" angular aperture, and a neat Mahogany Case about 7 in. square. The above, Microscope when further completed with the addition of a Second Eye-glass, Condenser for Opaque Objects, Live Box, Stage Forceps, large Glass Stage, and Polarising Apparatus, price £10, forms a most complete and valuable Microscope, and in every respect as useful as a much more expensive one.

A Catalogue post free on application to M. Pillischer, Optician, 88, New Bond-street, London, W.

W. Twinberrow begs to draw the

attention of the Medical Profession to his EXTRACT of INDIAN HEMP, prepared expressly for him at Calcutta, its peculiar sedative properties being so beneficial where opiates are inadmissible. Also to his MEDICINAL EXTRACTS, prepared from the fresh plants (Hyoscyamus Niger, Conium Maculatum, Atropo, Belladonna, Cotyledon Umbilicus, etc.) Also to his Liq. Taraxaci, Liq. Galli Aparinis (a valuable alternative), Liq. Parietariae (diuretic), and Liq. Belce (prepared from the Ægle Marmelos, or Indian Bael), for dysentery and diarrhoea. W. T. has a large supply of INDIAN BAEL on hand. 2, Edwards-street, Portman-square.

BOUDAULT'S PEPISINE imported in original bottles. *Ext. Laricis Europ.*

IMPORTANT TO THE PROFESSION.

Best Iron Wire, prepared expressly by

COCKER BROTHERS, NURSERY-STREET, SHEFFIELD, for SURGICAL PURPOSES, as supplied to Professor Simpson, Edinburgh; Dr. Churchill, Dublin; Mr. T. Spencer Wells, London; Dr. Bozeman, Montgomery, U.S.; and many others.—See Professor Simpson's Lecture, Medical Times, January 1st, 1859.

POULTICES SUPERSEDED! SPONGIO PILINE.

The Profession are respectfully

informed, that the WANDLE FELT COMPANY having purchased Mr. MARKWICK'S PATENT for the well-known SPONGIO PILINE, for the application of moist heat, in lieu of Poultices and Fomentations, and the IMPERMEABLE PILINE, for Rheumatism, for promoting perspiration, and for the application of stimulating liniments, are now supplying these articles, of superior manufacture, and at greatly reduced prices, at 27, BEDFORD-BURY, COVENT-GARDEN, London, and also through the Wholesale and Retail Druggists in town and country.

Bass's East India Pale Ale.—The

OCTOBER BREWINGS of this Celebrated Ale, and the MILD BURTON ALES are now arriving in casks of eighteen gallons and upwards. Our stock of Ale in bottle is in good condition. Barclay's Porter and Stouts, in bottle and cask, may also be had of BERRY, BROS. and CO. 3, St. James-street, London.

To Students and others.—You will do

well to inspect the NEW STOCK of Messrs. MILLIKIN and LAWLEY, 161, Strand, adjoining King's College, where the best and most modern INSTRUMENTS may be had at very reasonable charges. Trusses, Crutches, Splints, Legs, and all kinds of Surgical Appliances, made to order with precision and despatch.

Williams and Son's Pure Glycerine

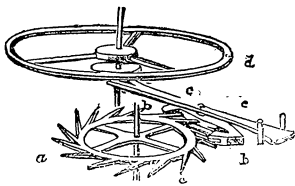

SOAP. Analysed by Dr. Hofmann, F.R.S., and Professor Redwood, Ph.D., strongly recommended by many eminent members of the Medical Profession, and favourably noticed by the following Medical Journals:—

THE LANCET.
THE MEDICAL TIMES AND GAZETTE.
THE BRITISH MEDICAL JOURNAL.
THE MEDICAL CIRCULAR.
EDINBURGH MEDICAL JOURNAL.
THE DUBLIN HOSPITAL GAZETTE.

It is suited to all cases of delicate skin (whether arising from disease or otherwise), and is admirably adapted for nursery use. May be had of all respectable Chemists, Perfumers, etc.

33 & 34, LUDGATE-HILL, LONDON, E.C. ESTABLISHED 1749.

To the Medical Profession.—W. Barclay
SNOW is instructed to LET a very DESIRABLE RESIDENCE, with its appropriate Fashionable FURNITURE, the Property of a Gentleman who has received an Appointment. The whole will be Sold under its Value, and an introduction given which might be greatly extended in a first-class and promising district near town, in Kent. This is a rare opportunity for a Gentleman commencing. For particulars and terms apply at the Agency Offices, 47, Mortimer-street, Cavendish-square, W.

INDIA RISK ASSURANCES.

Family Endowment Life Assurance AND ANNUITY SOCIETY.

Established 1835, empowered by Special Act of Parliament. Head Office, 42, New Bridge-street, London, E.C., with Branches and Agents at Calcutta, Madras, Bombay, Agra, and Hongkong, as well as throughout the United Kingdom.

Subscribed Capital, Half-a-Million. Annual Income, upwards of £50,000. Accumulated Invested Fund, £200,000.

This Society transacts every description of Assurance business, and offers to Insurers great facilities and advantages, combined with perfect security. Eighty per cent. of the profits belong to the assured.

Parties about to proceed to India may effect insurances on highly favourable terms, and are invited to examine the Society's general and special advantages, as set forth in the prospectus of the Indian Branch.

Active Agents are required in all districts not efficiently represented, to whom liberal commissions will be allowed, and at the death of an agent one-half of the ordinary renewal commissions of the agency will (under a fixed condition), be continued to his widow or other nominee during life.

Medical men introducing business to the Society are allowed the same Commissions as are allowed to Solicitors.

Applications for agencies, prospectuses, and further information may be addressed to

EDWIN H. GALSWORTHY, Actuary and Secretary.

[ESTABLISHED 1841.]

Medical, Invalid, and General Life OFFICE, 25, Pall-mall, London.—Empowered by special Act of Parliament

At the SEVENTEENTH ANNUAL MEETING, held on the 25th November, 1858, it was shown that on the 30th June last.—

The number of Policies in force was	6083
The Amount Insured was	£2,551,136 Gs. 6d.
The Annual Income was nearly	£120,000

The new Policies issued during the last Five years are as follows:—
5411 Policies for £2,599,658, yielding £110,624, in Premiums, showing an average yearly amount of new business of more than

HALF A MILLION STERLING.

The Society has paid claims on 1002 Policies, assuring £426,044, since its establishment in 1841.

Assurances are effected at home or abroad on healthy lives at as moderate rates as the most recent data will allow.

INDIA.—Officers in the Army and civilians proceeding to India, may insure their lives on the most favourable terms, and every possible facility is afforded for the transaction of business in India.

INVALID LIVES assured on scientifically constructed tables based on extensive data, and a reduction in the premium is made when the causes for an increased rate of premium have ceased.

MEDICAL MEN are consulted in every case, and are paid a Guinea for each Report, and receive the same advantages as Solicitors for any business they may introduce.

Policies issued free of stamp-duty, and every charge but the premiums. In the event of death during the days of grace, the risk binding on the Society if premium paid before the days of grace expire.

Every information may be obtained at the chief office, or on application to any of the Society's agents. C. DOUGLAS SINGER, Secretary.

H. Silverlock's Medical Label Ware-

HOUSE, Letter-Press, Copper-plate, and Lithographic Printing Offices, Wardrobe-terrace, Doctors'-commons, London, E.C.

H. SILVERLOCK'S stock of Labels for Dispensing purposes having been recently revised and enlarged, now consists of upwards of 800 different kinds. Yellow and Green Labels for Drug Bottles, Drawers, &c., at per book or dozen: a Book, containing a selection in general use in Surgeries or Dispensaries, 10s. 6d. Priced Catalogues of the above may be had, post free, on application. Printing of every Description at Moderate Prices.

Bastick's Oleo-Cubebine.—This

elegant preparation consists of the active principles of cubeb, the cubebine and the essential oil in their most effective and least nauseous form. It has been administered with very satisfactory results in gonorrhoea and other diseases where the use of cubeb is indicated. It forms an excellent combination with copaiba balsam. Dose, thirty to sixty minims in an emulsion or floating on water—Pharmaceutical Laboratory, 2, Brook-street, Bond-street, London.

Scammony Manufactured from the

ROOT.—This Pure Resin may be had of all Wholesale Druggists at 25 per cent. under the price of the best Virgin Scammony.

And the superiority of its quality was fully explained at a meeting of the Pharmaceutical Society, and reported at length in their Journal of March last, from which the following are extracts:—

"From these numerous observations, one hundred and twenty in number, together with many others which have not been tabulated, I am quite convinced that the scammony prepared by the new process from the untapped root is quite equal, as a remedy, to the very best virgin scammony which is met with in commerce, and equal, in fact, to the resin which is extracted from commercial scammony by means of ether; and it possesses this most important advantage over the scammony of commerce, namely, of being entirely free from the frauds which are almost constantly practised upon it in the country where the plant grows, and in which it has hitherto been collected, and, therefore, being perfectly uniform in its physical characters, composition and therapeutic action. There can, therefore, be no objection, but, on the other hand, manifest advantage, in employing it in place of the scammony commonly met with.

"A. B. GARROD, M.D., F.R.S., F.R.C.P.

"Professor of Materia Medica, Therapeutics and Clinical Medicine at University College; Physician to University College Hospital."

"I have endeavoured to ascertain the relative activity of Messrs. M'Andrew's scammony, and of a fine specimen of commercial virgin scammony, by prescribing these drugs alternately in equal doses to the same patient. The results, according to the judgment of myself and others who have assisted me in watching the cases, is that in most instances Messrs. M'Andrew's scammony has proved itself decidedly more active than the virgin scammony. As to pleasantness of operation, or the reverse, there seemed to be no choice between the two specimens.

"That a preparation of scammony should be a little more or a little less active is of comparatively small importance. It is far more important that the drug should have a fixed and uniform composition and activity, so that the prescriber may know, with an approach to certainty, what doses are required to produce a given effect. This advantage of uniform activity Messrs. M'Andrew's scammony seems likely to possess over the scammony which has hitherto been in common use, and which is a drug notoriously of most uncertain composition and power.

"GEORGE JOHNSON, M.D., F.R.C.P.

"Professor of Materia Medica and Therapeutics in King's College; Physician to King's College Hospital."

Blancard's Pills of Unchangeable

IODIDE OF IRON,

Recommended by the Academy of Medicine of Paris, and authorised by the Medical Council of St. Petersburg, Extensively tried in the Hospitals of France, Belgium, Ireland, Turkey, &c. Favourably noticed at the Universal Exhibition of New York, 1853, and Paris, 1855.

"Of all the modes hitherto proposed of administering iodide of iron in the pure state, I think Mr. Blancard's the best."—Chemistry applied to Therapeutics, by M. Mialhe, Deputy-Professor to the Faculty of Medicine of Paris, Pharmacien to the Emperor, 1856, p. 319.

These Pills stand now very high in the therapeutics of every country, as may be seen by the above quotations, and also by the numerous scientific articles in medical periodicals and works (a).

Being enveloped in a very thin resino-balsamic coating, they present the great advantage of not being liable to any deterioration, of having no taste, of being small, and not distressing the stomach. As they possess the properties both of iodine and iron, they are especially beneficial in chlorotic, scrofulous, tubercular, or cancerous affections, as also in leucorrhoea, amenorrhoea, anaemia, &c. &c., and they furnish the medical man with an excellent means of modifying lymphatic, feeble, and debilitated constitutions. Dose, 2 to 4 pills a day.

N.B.—Impure or altered Iodide of Iron is an unsafe remedy, and may even prove dangerous. Only such bottles as bear an electro-plated seal fixed to the lower part of the cork, and the signature of the inventor placed on a green label, are to be considered as prepared by Mr. Blancard. The public should beware of spurious imitations.

To be had at M. BLANCARD'S, Pharmacien, Rue Bonaparte, No. 40 Paris. General dépôt in England at M. Gabriel Jozeau's, French chemist 49, Haymarket, London. In Ireland, at Mr. Vitties, Stevens's Hospital Dublin. In the United States, at E. and S. Fougere, Chemists, 30, North William-street, New York. To be obtained retail from the principal Chemists.

A female to attend on Ladies.

Professors of Anatomy and STUDENTS

are invited to inspect the Stock of Skeletons, Skulls, separated and entire—Vertebrae, Hands and Feet on catgut, and various loose bones, which are well prepared, perfectly white, and free from grease or smell. The selection of this stock having been made by a good Anatomist, W. M. can confidently recommend them as being well marked, perfect bones, at low prices.

W. MATTHEWS, 8, Portugal-street, Lincoln's-inn-fields, London.

Pratt's Artificial Leg.

J. PRATT begs to call the attention of the Profession to the following Testimonial, just received:—

"Somerset,

June 20th, 1858.

"DEAR SIR,—It affords me much pleasure in being able to state that the Artificial Leg which you supplied me with is far beyond my best anticipations. From its being so LIGHT IN WEIGHT, and its action in the foot so natural, I can walk, or ride on horseback, with ease and comfort; and few indeed would detect it as being other than natural. It has given me full satisfaction.

I am, dear Sir, yours very truly,

To Mr. J. Pratt,
Surgical Instrument Maker,
420, Oxford-street."

JOZEAU'S COPAHINE MÈGE

Or SACCHARATED CAPSULES.—Copaiba and Cubeba are, doubtless, the best remedies, but these drugs are of a repulsive taste and odour, and occasion colicky pains, nausea, and gastric disturbance. M. Jozeau has succeeded in rendering these valuable therapeutic agents perfectly innocuous, by increasing, in his Copahine, all the curative properties. This preparation has been adopted by the Paris Academy of Medicine, after more than a thousand trials in Paris, and the different London Hospitals, viz., St. Thomas's, Guy's, and St. Bartholomew's, under the care of Messrs. Lloyd, Poland, and Le Gros Clark. "Lancet," Nov. 6, and Dec. 10, 1852. The Copahine, which is in form of a pretty pink sugar-plum, effects a cure in about six days, either in recent or chronic diseases. 100 Capsules, 4s. 6d., at G. JOZEAU'S, French Chemist, 49, Haymarket, London; 22, Rue St. Quentin, Paris; and all the most important Chemists.

TRADE MARK.

Brown & Polson's Patent Corn Flour,

preferred to the best Arrowroot. DELICIOUS in PUDDINGS, CUSTARDS, BLANCMANGE, CAKE, &c., and especially suited to the delicacy of CHILDREN and INVALIDS.

The Lancet states—"This is superior to anything of the kind known."

Trade Mark and Recipes, on each Packet, 4, 8, and 16 oz.

Obtain it from Family Grocers, Chemists, &c.

77A, Market-street, Manchester; and 23, Ironmonger-lane, London.

Human Osteology from France,

RAGINEL, 38, Ludgate-hill, City, E.C., London. Patronised by the Royal College of Surgeons of England. Illustrated Osteology on the bones themselves. Very large Stock on the lowest possible terms. Disarticulated Skulls, in twenty-two pieces, in box. All the bones of the disarticulated skulls will be fitted in right order in the presence of the purchaser so as to show that every bone of each set belongs to the same Skull; it will be the same for all other disarticulated pieces. Skulls with Sections. Hands and Feet on catgut. Disarticulated Skeletons, quite complete, with the Skull same body. Articulated Male Skeletons, the bones very well marked. STUDENT'S CASE OF OSTEOLOGY, COMPLETE. Splendid Pieces for Lecturers and Museums.

Crosse and Blackwell, Purveyors in

Ordinary to Her Majesty, respectfully invite attention to their PICKLES, Sauces, Tart Fruits, and other table delicacies, the whole of which are prepared with the most scrupulous attention to wholesomeness and purity. The practice of colouring pickles and tart-fruits by artificial means has been discontinued, and the whole of their manufactures are so prepared that they are not allowed to come in contact with any deleterious ingredient. A few of the articles most highly recommended are, Pickles and Tart Fruits of every description, Royal Table Sauce, Essence of Shrimps, Soho Sauce, Essence of Anchovies, Jams, Jellies, Orange Marmalade, Anchovy and Bloaters Pastes, Strasbourg and other Potted Meats, and Calf's-Foot Jellies of various kinds for table use. C. and B. are also sole agents for M. Soyer's Sauces, Relish, and Aromatic Mustard; and for Carstairs' Sir Robert Peel's Sauce, and Payne's Royal Osborne Sauce. The above may be obtained of most respectable Sauce Vendors throughout the United Kingdom; and Wholesale of CROSSER and BLACKWELL, 21, Soho-square.

Surgical Instruments, and every Im-

plement necessary for Surgeons and Druggists, can be had (warranted best quality and moderate prices), retail as well as wholesale, from the Manufacturer, JAMES ARNOLD, 35, WEST SMITHFIELD, St. Bartholomew's Hospital, London.

Single Circular Truss, 2s. 6d.; double ditto, 5s.; on Salmon's Expired Patent, 4s. 6d.; double ditto, 9s.; on Coles's Expired Patent, 5s.; double ditto, 10s.; Cotton Net Suspensory Trusses, from 10d.; Elastic Stocking Net bandage, 4d. per yard; Case of Tooth Instruments, £1; Case of Cupping Instruments, £2 13s. 6d.; Case of Pocket Instruments, £1; Brass Enema Syringe, complete in mahogany case, 10s. and 12s.; Case of Dissecting Instruments, Ivory Handles, 15s.; best Bleeding Lancets, per dozen, 18s.

Those who cannot swallow Cod-Liver

OIL in its crude state should try NEWBERRY'S COD-LIVER OIL CAKES.—"The gingerbread is extremely light and pleasant, the flavour of the oil being completely covered."—Medical Times, Feb. 12th, 1850. Packets, 1s. 9d. and 3s. F. NEWBERRY and SONS (Proprietors of the "PULVIS JACOBI VER, NEWBERRY'S," 45, St. Paul's Churchyard, London. ESTABLISHED A. D. 1746.

For Infants.—The British Feeding

BOTTLE (registered) may be placed in any position without the Food running out. The supply can be regulated by a stop-cock; being electroplated, it may be instantaneously cleaned. Unlike wood, ivory, or bone, it is impervious to moisture, cannot crack or become sour; there is no possibility of the infant drawing air with the food.

By W. T. COOPER, Pharmaceutical Chemist, 23, Oxford-street, London. Price 7s. 6d., or free to any Railway Station, 8s. 6d.

MEDICAL AGENCY.

NOTICE OF REMOVAL AND CHANGE OF FIRM.

Mr. Lara (for the last eight years the sole representative of LANE and LARA Medical Agents and Arbitrators and Lunatic Asylum Registrars,) begs to inform the Profession that, in consequence of the daily increasing support with which he has been favoured, and for which he tenders his sincerest thanks and acknowledgments, he has taken into PARTNERSHIP Mr. James Maxfield Walters, a gentleman who has had considerable experience in the business. It will, therefore, from and after Christmas, 1858, be carried on, under the Firm of LARA and WALTERS, at 6, PUMP-COURT, Middle Temple, E.C., whither they have removed their Offices from 22, Buckingham-street, Adelphi, in order to provide that larger accommodation which a constant intercourse with a great majority of the entire body of General Practitioners in England has rendered necessary.

Partnerships and Practices sold and valued: Asylums transferred: Arbitrations effected: Assistants provided (if for a permanence without charge to Employers): and every other description of business transacted for the Profession at a fixed and moderate cost. Attendance from 11 till 4.

Epidemiological Society.—The

OPENING MEETING of the Session 1859-60, will be held on MONDAY, November 7, at eight p.m., at 37, Soho-Square, when, after a brief INTRODUCTORY ADDRESS, by Dr. BABINGTON, the President, a Paper on the "Theory of Zymosis," will be read by Dr. B. W. Richardson. J. O. McWILLIAM, M.D., F.R.S., Secretary.

Liverpool Medical Registration

ASSOCIATION.—A GENERAL MEETING of the Members of this Association will be held at the MEDICAL INSTITUTION, Mount Pleasant, Liverpool, on WEDNESDAY the Ninth of November, 1859, to receive the report of the Provisional Committee, to adopt a code of laws and other business. ELLIS JONES, President. A. B. STEELE, Hon. Secretary.

Evening Demonstrations of Anatomy.

—Mr. CHRISTOPHER HEATH, Demonstrator of Anatomy at the Westminster Hospital, will resume his Evening Course of DEMONSTRATIONS and EXAMINATIONS upon the DISSECTED SUBJECT on Wednesday, the 5th of October. The Demonstrations take place on Monday, Wednesday, and Friday evenings, during the Winter Session, from Seven to Nine o'clock, at the Westminster Hospital. Entrance Fee (perpetual) Five Guineas.

Leicester Infirmary and Fever-House.

A VACANCY having occurred in the office of HOUSE-SURGEON and APOTHECARY to this Institution, by the Resignation of Dr. Sloane, any person qualified, and desirous of offering himself as a Candidate, is requested to send his testimonials, directed to the Secretary, eight days prior to the Election, which will take place at a Special General Board, to be held at the County Assembly Rooms, on THURSDAY, the First day of December next, at Twelve o'clock at noon. The Salary will be £120 for the first year, rising at the rate of £10 per annum until the fourth year, when it will be £150 per annum, with board, lodging, and washing provided by the Institution. The candidate must be a Member of the College of Surgeons, of London, Edinburgh, or Dublin, also a Licentiate of the Apothecaries' Company of London, and have attained the age of twenty-three years. By Order of the Board, J. H. DAVIS, Secretary. October 20, 1859.

Nervous and Mental Disorders.—Wyke

House, Sion Hill, Isleworth, Middlesex, a Private Establishment for the care and recovery of Ladies and Gentlemen mentally afflicted. Conducted by Mr. ROBERT GARDINER HILL, late Resident Medical Professor of Eastgate House, Lincoln, and by Dr. E. S. WILLETT.

Private Establishment for the Insane,

CHURCH STRETTON, near SHREWSBURY. This Establishment is conducted by the Resident Proprietor, Dr. S. G. BAKEWELL, Son of the late Mr. Bakewell, of Spring Vale, Staffordshire. The Ladies occupy a separate residence, and are under the immediate care of Mrs. Bakewell. The neighbourhood of Church Stretton is very picturesque and healthy. Its similarity to Malvern is often noticed. A Carriage is kept for the use of the Inmates. References can be given to Medical Gentlemen and others in Shrewsbury, Birmingham, Hereford, and throughout Staffordshire. Church Stretton is a first-class Station on the Shrewsbury and Hereford Railway, twelve miles from Shrewsbury.

Wanted, in the Hereford General

INFIRMARY, A HOUSE SURGEON.—Candidates must be Members of one of the recognised Colleges of Surgeons, and Licentiates of the Apothecaries' Company, London. Every information respecting the duties and requisite qualifications will be furnished on application to the Secretary. Testimonials must be sent to the Secretary before THURSDAY, the 24th day of November next. C. H. PRICE, Secretary. October 27, 1859.

Hereford General Infirmary.—A

SPECIAL MEETING of the GOVERNORS of this CHARITY will be held on THURSDAY, the 1st day of December next, to Elect a CANDIDATE to fill up the vacancy of HOUSE-SURGEON, occasioned by the resignation of Mr. J. E. Smith. The ballot to commence at noon, and close precisely at Two o'clock, p.m. C. H. PRICE, Secretary. October 27, 1859.

Medical Transfer and Partnership.

30, Bucklersbury, Cheapside.

Mr. Orridge, Medical Transfer Agent,

Referee, and Valuer of Medical Property, may be consulted, at the above Address, by Gentlemen about to receive PARTNERS, or to RELINQUISH or to COMMENCE Practice.

Mr. Orridge is known to many of the Hospital Physicians and Surgeons of London.

He has been concerned professionally for a considerable proportion of the most influential Practitioners (including Partners in many of the leading Medical Firms), to whom he has the satisfaction of being permitted to refer—a privilege that he trusts will be regarded as a proof of the sincerity of his endeavours to conduct these transactions in an honourable and straightforward manner.

Gentlemen desirous of obtaining Mr. Orridge's opinion, or requiring his attendance professionally in any part of England, can obtain terms on application, by (confidentially) transmitting name and address.

Office Hours, from Eleven to Four.

The King's College Hospital Old

STUDENTS' ANNUAL DINNER will be held at the ALBION TAVERN, Aldersgate-street, on THURSDAY, December 1, 1859. All Gentlemen wishing to attend, are requested to communicate with the Secretary at the Hospital.

WHARTON P. HOOD, Secretary.

King's College, London.—Professor-

SHIP of BOTANY.—This OFFICE being now VACANT, the Council are ready to receive applications from gentlemen desirous of offering themselves for the same. For further particulars apply to.

J. W. CUNNINGHAM, Secretary.

Samaritan Free Hospital for Women

and CHILDREN, 18, EDWARD'S-STREET, PORTMAN-SQUARE.

A VACANCY having occurred in the office of PHYSICIAN to this Hospital, by the resignation of Dr. Graily Hewitt, Candidates for the office are requested to send in testimonials and qualifications to the Honorary Secretary on or before the 10th inst. Candidates must be Doctors of Medicine of Oxford, Cambridge, London, or Edinburgh, or Licentiates of the Royal College of Physicians of London.

The Committee of Visitors of the

LUNATIC ASYLUM for the Counties of Bedford, Hertford, and Huntingdon lately erected near Arlsey, Bedfordshire, are prepared to appoint an ASSISTANT MEDICAL OFFICER to the Asylum, with a salary of £70 per Annum, with Board, Washing, and Furnished Apartments. He must be a Member of the Royal College of Surgeons, London, and a Licentiate of the Apothecaries' Company, and duly registered according to law. He will be expected to enter upon his duties early in the ensuing year, on the opening of the Asylum. Applications, with testimonials, and a statement of Professional Qualifications, age, and previous engagements, to be addressed to the Committee of Visitors, under cover to the Clerk to the Visitors, St. Cuthbert-street, Bedford, on or before the 19th of December next, who will give any further information that may be required. Bedford, October 10, 1859.

Northampton General Lunatic

ASYLUM.—A RESIDENT MEDICAL SUPERINTENDENT is REQUIRED for this Institution. He must be either a Doctor of Medicine of one of the Universities of the United Kingdom, where residence and exercise are required to take a Degree, or a Fellow or Member of the Royal College of Surgeons of England, and must have had experience in the treatment of Insanity. He must be a Member of the Church of England, and married. Salary, £400 per annum, with Furnished Apartments, Board and Attendance. Candidates qualified as above are requested to send in their Testimonials to the Secretary, on or before the 28th day of November next. Candidates whose qualifications are approved will be invited to attend a Meeting of the Directors (at their own expense), of which they will receive notice, and the Testimonials of other Candidates will be returned. The Gentleman selected will be required to enter upon his duties on the First day of February, 1860.

The Asylum, Oct. 27th, 1859.

JOHN GODFREY, Secretary.

Braceborough, near Stamford.—To be

LET, the Noted BRACEBOROUGH SPA, with deep Plunging, and Hot and Cold Baths. A Good Dwelling-House, Garden, Orchard, and Premises, with Eight or Ten Acres of good grass land adjoining the same. The water of this Spring being found so very beneficial in Scorbutic, Rheumatic, and divers other complaints, the occupation of it would be a great requisition to any Medical Man, especially if residing in one of the populous villages in the neighbourhood. For further particulars, apply to Messrs. R. M. and F. Lowe, 2, Tanfield-court, Temple, London, or to Mr. Musson, Estate Agent, Peterborough.

Wanted, by an Attendant, a Situation

to Wait upon an INSANE GENTLEMAN. The Advertiser has had Seventeen Years' Experience in one of the principal Establishments in the North of England. Unexceptionable references will be given. Apply by letter, addressed to Mr. William Snow, Low Ousegate, York.

To Medical Students and Others.—To

BE LET in a Private House near the British Museum, TWO BED-ROOMS, a small one 6s. per week, a larger one with accommodation for two, 5s. each. The use of a Sitting-room in the evening for reading if required, without extra charge for gas and firing. A reference required. Cards of address at W. Nock's, Bookseller, Bloomsbury-street.

MEMORIAL TO THE LATE SIR JAMES McGRIGOR, BART.

K.C.B. K.C. K.T.S. F.R.S. ETC. ETC. ETC.

The admirers of this distinguished Officer have determined to testify their deep regard for his memory by the erection of a Memorial, on which shall be inscribed the nature of those long and arduous services (extending over a period of fifty-seven years, in every quarter of the globe), which acquired for him so repeatedly the warmest eulogies in the public despatches of the various General Officers under whom he served, especially in those of the late Duke of Wellington, who, on the 26th July, 1814, when referring to the manner in which the Chief of the Medical Department had conducted that responsible and onerous position, concludes by saying—

"I consider him one of the most industrious, able, and successful public servants I have ever met with."

Sir James McGrigor was Chief of the Medical Department of the Army in the expedition against the Island of Grenada; in the expedition under Sir David Baird from Bombay through the deserts of Thebes and Suez to Alexandria; and also in the disastrous Walcheren Expedition; moreover, he was present in the same capacity with the army in the Peninsula, from Ciudad Rodrigo to the final Battle of Toulouse. He was also twice shipwrecked during his period of active service.

To the Medical Officers of the Army, and to the Profession in general, his name must always be associated with the two most invaluable Institutions which he founded and fostered, until the end of his life, with parental care—one, an Assurance Society, for granting pensions to widows; and the other a Benevolent Society, which has been the means of distributing many hundred pounds annually, among the most necessitous orphans of Medical Officers.

Sir James was also the founder of the unrivalled National Museum of Natural History at Fort Pitt, Chatham, as well as a Library, to which he contributed more than 3000 volumes.

To such an energetic and faithful public servant, one of the contemporaries of England's great Commander, the nation owes a debt of deep gratitude; and it is hoped that a sufficient amount will be realised to do honour to his name.

JOHN WYATT, Coldstream Guards, Hon. Secretary.

Fifth Edition, two vols. fcap. 8vo, price 12s. 6d.

The Dublin Dissector, or System of

PRACTICAL ANATOMY, comprising a concise Description of the Bones, Muscles, Vessels, Nerves, and Viscera, also the Relative Anatomy of the different Regions of the Body; for the Use of Students in the Dissecting Room. By ROBERT HARRISON, M.D., V.P.R.C.S.I., M.R.I.A. Illustrated by 160 Engravings on Wood.

"A work highly and justly esteemed for its amount of information and clearness of arrangement and language. In its present enlarged and improved state it will supply every instruction that the student can require, and it will be the very best companion he can take to the dissecting-room."—William Lawrence, Esq., President of the Royal College of Surgeons, London.

"I have always considered the work the best of its kind; and in this new edition its superiority is, I find, much increased."—S. Wharton Jones, Esq., F.R.S.

"An elegant and valuable work, the companion equally of the lecture theatre and dissecting room."—Medical Gazette.

"Far above all other competitors in its own peculiar department." "It has no rival in any language."—Dublin Journal of Medical Science.

London: Longman and Co.

Fourth Edition, fcap. 8vo, price 12s. 6d.

Churchill on the Diseases of Women,

INCLUDING THOSE OF PREGNANCY AND CHILDBED.

"It has the testimony of our unqualified approbation. It surpasses any other that has ever issued on the same subject from the British press."—Dublin Medical Journal.

"A standard work of reference for the accoucheur and general practitioner."—Edinburgh Medical and Surgical Journal.

"As an epitome of all that is known in this department of Medicine, the book before us is perhaps the fullest and most valuable in the English language."—Dublin Medical Press.

London: Longman and Co.

Fifth Edition, 8vo, price 15s.

Neligan's Medicines, their Uses and

MODE OF ADMINISTRATION.

Besides numerous and important Additions, the entire work has been thoroughly Revised, and all the formulæ contained in the British Pharmacopœias are, now for the first time, given at length.

London: Longman and Co.

ENTIRELY NEW EDITION OF DR. URE'S DICTIONARY.

Now ready, Part I. in 8vo, price 5s., to be continued Monthly, and completed in 14 Parts, price 5s. each,

MANUFACTURES, and MINES. A New Edition, chiefly rewritten and greatly enlarged; illustrated with nearly 2000 Engravings on Wood, Edited by ROBERT HUNT, F.R.S., F.S.S., Keeper of Mining Records, &c. Assisted by numerous Gentlemen eminent in Science and connected with the Arts and Manufactures. A complete List of the Contributors' Names is printed on the cover of Part I. and in the prospectus, which may be had gratis of Messrs. Longman and Co. and all Booksellers.

London: Longman, Green, Longman, and Roberts.

BY WILLIAM ADDISON, M.D., F.R.S.

Cell Therapeutics. 8vo. cloth, 4s.

ON HEALTHY AND DISEASED STRUCTURE, and the True Principles of Treatment for the Cure of Disease, especially Consumption and Scrofula, founded on Microscopical Analysis. 8vo, cloth, 12s. John Churchill, New Burlington-street.

Post 8vo, cloth, 6s. 6d.

Illustrations of Difficult Parturition,

WITH PRACTICAL COMMENTARIES. By J. HALL DAVIS, M.D. Licentiate of the Royal College of Physicians, Physician to the Royal Maternity Charity.

"The author's position and large experience entitle his opinions to respect. . . . The Clinical Report contains one hundred and forty-four instructive histories, related in a clear, concise manner."—Dublin Quarterly Medical Journal.

"We must refer our readers to Dr. Davis's book for his opinions. . . . We feel high respect for his judgment and intelligence."—Medico-Chirurgical Review.

"The result of five-and-twenty years spent for the most part in the responsible and trying position of Physician to the Royal Maternity Charity is in due time and season produced in the form of an unpretending but satisfactory volume."—Medical Times and Gazette.

"Amongst the many valuable contributions to Clinical Midwifery, this book of Dr. Hall Davis will, we think, occupy a permanent place."—Lancet.

John Churchill, New Burlington-street.

One Vol. 8vo, cloth lettered, price 8s. 6d.,

On the Constitutional Treatment of

FEMALE DISEASES. By EDWARD RIGBY, M.D., etc.

"We know of no other obstetric writer who so strongly insists on the intimate connexion between uterine and constitutional disorders, or who has carried out this principle so consistently and so successfully. On this account we look upon the work as peculiarly valuable, and calculated to do an immensity of good at the present time, by dispelling the one-sided and narrow views so generally prevalent respecting this class of diseases, and placing their pathology and treatment on a sounder and more rational basis."—Dublin Quarterly Journal of Medical Science.

London: Henry Renshaw, 356, Strand.

8vo, cloth, with a 4to Atlas of Plates, 21s.

A Treatise on Rheumatic Gout, or

CHRONIC RHEUMATIC ARTHRITIS on all the ARTICULATIONS. By ROBERT ADAMS, A.M., M.D., M.R.I.A., Ex-President of the Pathological Society of Dublin.

"We have only to add the most unqualified approbation of the work. Its value is increased by admirable woodcuts and lithographs; and it must be regarded not only as most creditable to the author, maintaining and enhancing his high reputation and that of the Dublin School, but as a real acquisition to the medical literature of the age."—Medical Times and Gazette.

"There accompanies the work a large atlas of lithographic drawings, beautiful specimens of art, which enhance in no small degree the value of this great literary labour."—Dublin Medical Journal.

"The monograph of Dr. Adams, with its illustrative atlas, is the result of clinical and pathological investigations continued through many years.

"As a record of facts observed with regard to rheumatic gout, Dr. Adams's work forms a most valuable contribution to our knowledge."—British Medical Journal.

"Probably no living practitioner has paid greater attention to the special subject of this treatise than its author; he is therefore well entitled to give his views upon it. . . . This is a sound practical work, having many characteristics of the Dublin School, and reflects much credit upon the author."—Medical Circular.

John Churchill, New Burlington-street.

Just Published, the Eighth Edition, price 12s. 6d.

Druitt's Surgeons' Vade-Mecum: a

Manual of Modern Surgery, the Eighth Edition, much enlarged improved and illustrated by 328 highly-finished Wood Engravings.

MUTUAL LIFE ASSURANCE.**Scottish Equitable Life Assurance**
SOCIETY. INSTITUTED 1831.

HEAD OFFICE:—26, ST. ANDREW-SQUARE, EDINBURGH.

The Profits are divided every three years, and wholly belong to the
members of the Society. The last division took place at 1st March, 1859,
and from the results of it is taken the following**EXAMPLE OF ADDITIONS.**A POLICY FOR £1000, DATED 1st MARCH, 1832,
is now increased to £1654 9s. 5d. Supposing the age of the Assured at the
date of entry to have been 40, these Additions may be surrendered to the
Society for a present payment of £363 17s. 8d., or such surrender would
not only redeem the entire premium on the Policy, but also entitle the
party to a present payment of £104 4s., and, in both cases, the Policy
would receive future triennial additions.

THE EXISTING ASSURANCES AMOUNT TO .. £5,272,367

BERRY, BROS, and CO. 3, St. James'-street, London.

Crosse and Blackwell, Purveyors inOrdinary to Her Majesty, respectfully invite attention to their
PICKLES, Sauces, Tart Fruits, and other table delicacies, the whole of
which are prepared with the most scrupulous attention to wholesomeness
and purity. The practice of colouring pickles and tart-fruits by artificial
means has been discontinued, and the whole of their manufactures are so
prepared that they are not allowed to come in contact with any deleterious
ingredient. A few of the articles most highly recommended are, Pickles
and Tart Fruits of every description, Royal Table Sauce, Essence of
Shrimps, Soho Sauce, Essence of Anchovies, Jams, Jellies, Orange Mar-
malade, Anchovy and Bloater Pastes, Strasbourg and other Potted
Meats, and Cal's-Foot Jellies of various kinds for table use. C. and B.
are also sole agents for M. Soyer's Sauces, Relish, and Aromatic Mustard;
and for Carstairs' Sir Robert Peel's Sauce, and Payne's Royal Osborne
Sauce. The above may be obtained of most respectable Sauce Vendors
throughout the United Kingdom; and Wholesale of

CROSSE and BLACKWELL, 21, Soho-square.

ADDITIONAL TESTIMONY ON THE EXTRAORDINARY EFFICACY OF DR. J. COLLIS BROWNE'S (M.R.C.S.L., Ex-ARMY MEDICAL STAFF)

CHLORODYNE.

MEDICAL PROPERTIES—Anodyne, Diaphoretic, Sedative, Astringent, Antispasmodic, Diuretic.

A few Extracts of Medical Reports are furnished in testimony of the exceeding value of this New Remedial Agent.

The following extract from a letter by Dr. SHORTHOUSE (late of the Metropolitan Convalescent Hospital), of Carshalton, to a Medical friend in the North of England, is published by permission:—

.....“And now, my friend, about ‘Chlorodyne’—the infallible and incomparable Chlorodyne! The best idea I can give you of my estimate of its value will be in the fact, that I have within the last fifteen months used 160 ounces of it, and, as each ounce contains about fifty adult doses, I have given at least 8000 doses. This is what I have administered myself, and is altogether independent of a large quantity which I have prescribed, and the patients have procured for themselves. It is, as I said before, a remedy quite *unique*, and its effects totally dissimilar to those of opium or any other English medicine. It requires some little management in its administration, so as to ensure its best effects. Out of the many hundreds of patients for whom I have prescribed it, I have found it disagree with but three.

“Its mode of action is that of an astringent in suppressing hæmorrhage and diarrhoea; an anti-spasmodic in colic and all forms of spasmodic cough; an anodyne in allaying pain and excitement, and producing tranquillity and a most heavenly state of repose.

“The cases (among others) in which I have employed it have been twelve cases of phthisis; eight of these patients had been examined by other Medical men, and had been regarded as genuine cases of consumption, so that the nature of the disease does not rest upon my testimony alone. They were all well-marked cases; for I do not mention several others in an incipient stage. Two of the cases were in the last stage—*i. e.* cavities had formed in the lungs; two others were bordering upon this stage. The remaining eight were in the second stage—that of softening; in five of these hæmoptysis was a prominent symptom. All these cases have done, or are doing, exceedingly well. Five of them have quite recovered; the others, with one exception, are in a fair way towards recovery.

“I have used it in many cases of whooping-cough and bronchitis, especially that form of the disease attended with laryngeal complication, *i. e.* irritation of the superior laryngeal nerve, with a very harassing spasmodic cough; and in these cases I can speak of it as a remedy of the highest value.

“In dysentery and dysenteric diarrhoea, and in mucous diarrhoea with pain round the umbilicus, it is invaluable; one dose, or at most two, being sufficient. In simple diarrhoea it is hardly worth while giving it a trial. But its effects are most marked in cases of hæmorrhage, which it will arrest almost instantaneously; I have had several proofs of this. In some forms of neuralgia it also affords relief in a very short period.

“I hope I have now said enough to induce you to give it a trial. But don't be misled; it is not a cure-all, nor did I ever ‘puff it off as a universal panacea for all ailments.’ It is what is perhaps better—a valuable therapeutic agent, with which you may successfully combat disease in many of its forms, and those forms most frequent and most formidable. In addition to its astringent and anodyne properties, it also possesses remarkable chemical ones, and has a marvellous effect upon the absorbent and nutritive functions. I have seen cases of secondary sores and indolent ulcers assume quite new features, when the ordinary remedies have been combined with small doses of Chlorodyne.”

From W. VESALIUS PETTIGREW, M.D., Hon. F.R.C.S. Eng.; formerly Lecturer upon Anatomy and Physiology at St. George's School of Medicine.

“I have no hesitation in stating, after a fair trial of Chlorodyne, that I have never met with any medicine so efficacious as an anti-spasmodic and sedative. I have used it in consumption, asthma, diarrhoea, and other diseases, and am most perfectly satisfied with the results.”

From the “MEDICAL TIMES.”

“TO THE EDITOR OF THE MEDICAL TIMES AND GAZETTE.

“SIR,—In reply to an inquiry made by your correspondent, who subscribes himself ‘Nota Bene,’ whether any cases of benefit from ‘Chlorodyne’ have come to the knowledge of your readers, I beg to say that I have been greatly pleased at the results in a case of severe pain in the hip-joint and in the vertebrae of the neck, which came on in a man long subject to chronic rheumatism, attended with permanent enlargement of the knees, ankles, and one of the wrists. He could not tolerate Opium, Hyoscyamus, or Belladonna, and in despair almost I gave him a prescription for a mixture of Chlorodyne in water, the dose being twelve minims. He took only two doses, which acted so well that he compared his feelings to being transported to Paradise. The effects lasted for several days. Whenever his pains return, he now takes a dose at bedtime, feeling secure of an escape for some days from suffering. I have also applied it locally, with good results, but in too few cases to report much upon it. It produces a certain amount of warmth and perspiration, with a remarkably soothing state of mind, as well as arresting the pain. No headache or other unpleasant symptoms followed its administration.

“I am, &c. “THOMAS A. HENDERSON, M.D., L.R.C.P., Physician to the Ramsgate Infirmary.

“The Vale, Ramsgate, September 23, 1857.”
Extracts from the General Board of Health, London, as to its efficacy in Cholera.

“1st Stage, or Premonitory.—In this stage the remedy acts as a charm; one dose generally sufficient.

“2nd Stage, or that of Vomiting and Purging.—In this stage the remedy possesses great power, more than any other we are acquainted with, two or three doses being sufficient.

“3rd Stage or Collapse.—In all cases restoring the pulse. So strongly are we convinced of the immense value of this remedy, that we cannot too forcibly urge the necessity of adopting it in all cases.”

From THOMAS F. HALE, Esq., Surgeon, Saundersfoot, Pembrokeshire.

“SIR,—I should be much obliged by your forwarding three bottles of Dr. J. Collis Browne's Chlorodyne, which I have found most useful in allaying pain. I have used twelve ounces of it, and in nearly every case in which I have employed it, have every reason to be satisfied with the result; and although I object, as a rule, to use any preparation of a secret nature, and of whose composition I am not fully acquainted with, still, having once tried the Chlorodyne, and found that it really did produce the effects stated, I do not think I should be justified in withholding such a preparation from my patients when I see the value of the remedy.”

From C. V. RIDOUT, Esq., Surgeon, Egham, Surrey.

“SIR,—Having extensively used Dr. J. Collis Browne's Chlorodyne, I feel it incumbent upon me to add my testimony to the numerous evidences you have already received of the undoubted efficacy of this remedy. As an astringent in severe diarrhoea, and an anti-spasmodic in colic, with cramps in the abdomen, the relief is instantaneous. As a sedative in neuralgia and tic douloureux, I can record a case where its effects were very remarkable. It occurred in January last. A gardener applied to me with pain in the head, resembling most distinctly tic douloureux as usually met with in the face; it was impossible for him to prevent his head moving from side to side with great regularity at intervals of five seconds. The

pain and agony he described to be so acute that he was afraid it would induce madness. I prescribed ten minims of Chlorodyne every half-hour. The second dose mitigated his sufferings; and after the fourth dose he slept comfortably for some hours, and awoke refreshed and comparatively free from pain. I continued the Chlorodyne in diminished doses for a few days, since which time he has had no return of the attack. In uterine affections I have found it extremely valuable; and I could, if necessary, add many more striking instances of the powerful influence Chlorodyne exerts in controlling diseases.”

From H. LEE HOGG, Esq., Surgeon, Toddington.

“SIR,—I am much pleased with the action of Dr. J. Collis Browne's Chlorodyne. One day last week I was sent for in a hurry to visit a man suffering intense agony. I concluded he was passing a renal calculus, and I was correct. I at once gave him thirty minims of Chlorodyne, which caused almost immediate cessation of pain; and ten minims every four hours. The man passed a calculus as big as a small pea; and I have heard nothing more of him. I have also employed it in a case of severe after-pains with very satisfactory results; also in cases of asthma and bronchitis with marked benefit.”

From Dr. THOMAS SANDIFORD, Passage West, Cork.

“I will thank you to send me a further supply of Chlorodyne. It is the most efficacious remedy I ever used, affording relief in violent attacks of spasm within a minute after being taken. One patient in particular, who has suffered for years with periodical attacks of spasms of a most painful nature, and unable to obtain relief from other remedies, such as opium, &c., finds nothing so prompt and efficacious as Chlorodyne.”

From W. R. DAWES, Esq., Haddenham.

“DEAR SIR,—You should have heard from me sooner respecting the effects of Dr. J. Collis Browne's Chlorodyne, but the fact is, that I have found it so universally applicable as a sedative, that there is great difficulty in making a selection of cases which most strikingly mark its beneficial action without rendering my report inconveniently prolix. I can, however, most truly say, that it is a remedy more generally efficient than any other with which I am acquainted. Its sedative and anodyne effects are not only more speedily produced, but they are also more lasting, and are not followed by exhaustion, or headache, or disturbance of the digestive functions; on the contrary, in many instances its continued use has been followed by exhilaration of spirits and improvement of appetite, especially in the various painful symptoms attending uterine irritation. In hysteria and in dysmenorrhœa, this remedy acts like a charm, as also in nervous headaches and in many cases of cough. In fevers, combined in the early stage with tartarised antimony, it is often of signal service; nor is an increase of dose usually requisite to maintain its beneficial action. In a case of phthisis, the moderate dose of ten minims, taken every night, has sufficed for many months to secure quiet rest, scarcely disturbed by cough, while the omission of it is invariably followed by a restless and coughing night. One fact strikes me as very remarkable—namely, that while the tendency of Chlorodyne to produce constipation is so slight as rarely to require an aperient, it has never failed speedily to stop diarrhoea, or to extinguish attacks of ordinary Cholera. In only two or three instances has it disagreed. The sleep which follows the composing influence of the medicine is peculiarly light and refreshing.”

From Dr. B. J. BOULTON and Co., Horncastle—Sept. 26.

“We have made pretty extensive use of Chlorodyne in our practice lately, and look upon it as an excellent, direct sedative and anti-spasmodic. It seems to allay pain and irritation in whatever organ and from whatever cause.

“It induces a feeling of comfort and quietude not obtainable by any other remedy, and it seems to possess this great advantage over all other sedatives, that it leaves no unpleasant after-effects.”

CAUTION.—Be sure to ask for Dr. J. COLLIS BROWNE'S CHLORODYNE; disappointment will result from any other.—See the Manuscript Signature.

Price 3s. per ounce, and in quantity of 10 ounces carriage free.

REMARKS ON THE AFRICAN FEVER
ON THE LOWER ZAMBEZI. (a)

By DAVID LIVINGSTONE AND JOHN KIRK, M.D.

WHILE employed in trying to open up Africa to the influences of civilisation and commerce, the first thing that naturally attracted our attention as Medical men was the fever, which hitherto has proved one of the great barriers to the advances of Christian nations into the interior of the continent.

We have enjoyed considerable facilities for observing the disease during the last twelve months, not only among those of the expedition, but likewise among the Portuguese and natives; and our experience having been very different from that of others, we deem it desirable to lay the results before our Medical brethren.

Our observations are far from being so full as might be desired, but when travelling in this country, where the grass towers over head and almost hides the narrow path, it is of the utmost importance to possess correct views at the beginning. Our remarks may thus prove serviceable in preventing others from making a wrong commencement.

About a month was spent by the Expedition in endeavouring to find an opening through the Delta, from the sea to the main river.

This part may be described as abounding in mangrove swamps and damp plains covered with gigantic grasses. The mangrove swamps emitted a most offensive smell, and gave us the impression that they were most fitly named, "the hot-beds of fever."

Above the Delta the river is remarkable for the quantity of fine sand which it carries in its waters, and deposits everywhere in banks which during about half the year are exposed to the sun; there is comparatively little mud, and in this respect as well as in the greater height of its banks which are also of sand, it differs greatly from the rivers of the west coast.

The mountain of Meramhalla, 4000 feet high, appears to the east of Senna, and a range of hills on the north bank of the river stretches from that village up to Lupata, above which the country is hilly, and the banks of the river rocky.

Warned by the fate of the "Great Niger Expedition," it was resolved that no unnecessary delay should take place in the Delta, and that the prophylactic use of quinine should be tried.

The season chosen for entering the river was the winter (from May to August), the most healthy time for Europeans, though not the most favourable for navigation, and during the stay of the Expedition among the mangroves not a single case of fever occurred among the members, or among the officers and men of the *Pearl*, and H.M.S. *Hermes*, who accompanied it.

Quinine was taken regularly by all the Europeans, with a single exception, to the amount of two grains in sherry wine daily; and we were quite disposed to attribute our immunity to the prophylactic so much praised for its efficacy on the Niger; although the former experience of one of us suggested its total inefficiency to ward off an attack.

Three of our number became affected with incipient cinchonism; in their case the dose was lessened. We seemed always to be on the verge of cinchonism, as an additional dose could produce deafness and ringing in the ears to an intense degree in the course of a few hours.

The following is the number of those who escaped without a single case of sickness, although exposed to hard work in the sun, and frequently sleeping in the boats in the lower part of the Delta:—16 officers, 37 seamen, 12 Krumen, and 2 boys from Sierra Leone.

(a) This interesting paper has been forwarded to us with the following note by Sir James Clark:—

SIR,—I received the accompanying paper from Drs. Livingstone and Kirk, through the Foreign Office, a few days ago. If you agree with me that it is of sufficient importance to be communicated to the Profession, I shall feel obliged by its insertion in the *Medical Times and Gazette*.

22B, Brook-st., Grosvenor-sq., Nov. 5, 1859. I am, &c. J. CLARK.

VOL. XL. No. 1050.—NEW SERIES, No. 489.

Three of our number were left in charge of goods on an island about twenty miles above the mangrove swamps, but probably not beyond their influence. The soil was of stratified sand, with an alluvial layer on the surface, covered with grasses. The neighbouring country presented the same aspect as the island, and was similarly constituted. Previous to this there had been hard work and constant excitement. Those left on the island, although less exposed, had a comparatively inactive life. They had not been many days alone when two of their number became sick.

Mr. B— was seized with slight rigors, severe headache, delirium, with contracted pupils. These symptoms were sudden, and followed an imprudent course of exposure to the sun. Although removed in a few hours, they speedily returned after renewed exposure; but this time more severe, the full bounding pulse, dry tongue, and hot skin showing the intensity of the fever. Vomiting, which now commenced, proved the most troublesome symptom, and became an obstacle to all treatment, as remedies were not retained beyond a few seconds. Although the other symptoms abated after twelve hours, vomiting continued, and soon the disease returned in a more severe form, running on to muttering delirium, with involuntary picking of the bedclothes.

When on the verge of coma remedies began to be retained, and the action of a large dose of calomel with jalap resin relieved the cerebral disorder, and, by reducing the irritability of the stomach, allowed quinine to be given. Convalescence was very rapid; in a few days all trace of the disease had gone.

A fortnight afterwards Mr. B— was again seized with the same symptoms, vomiting again being the great obstacle, and, from its continuance after the others had been subdued, rendering the convalescence slow. Loss of memory and muscular weakness continued for some time after this attack. While Mr. B— was sick, Mr. C. L— had fever also, but in a very different form, and we did not then recognise the two as being the same disease. In him the symptoms were those of a cold, such as we see in Europe,—at first frontal headache, pain in the back and limbs, lassitude and indifference to what went on around; this state was followed by one in which he lay without speaking, headache had gone, the pulse was small and thready; the skin at one time burning hot, at others coated with a clammy perspiration. In this case slight diarrhoea had continued from the beginning. Quinine was tolerated; but although the constitutional action was evident, yet the fever did not abate until a mercurial purgative had been given.

These were the first cases of fever among us, nor did we see more for some time afterwards.

In the month of August all the goods had been conveyed as far as Shupanga. Two officers were left there in charge, while the steam-vessel proceeded to Tette, taking with her those who had suffered when at the island.

At this time the Portuguese were engaged in war against a party of rebels, and the army being destitute of Medical appliances of every description, an opportunity was offered of observing the fever and other diseases in their worst forms among those exposed without proper shelter or food, and in subjects frequently worn out by constitutional disease.

The commanding officer was the first case we were requested to see: he had obstinately refused all remedies, but being then in a state of coma, and unable longer to refuse, an active purge was given, followed by thirty-grain doses of quinine, which soon restored health. In him there had been no other symptom beyond those of severe constitutional fever running on rapidly to coma. This is the type most frequent in the lower parts of the Delta, especially at Quillimane. In the vicinity of Tette it is seldom fatal. The limited experience we here had seems to indicate that the type once established has a constant tendency to recur. Should further observation confirm this, it would become of importance to send all Europeans on their arrival to the higher lands; so that, should they be subject to fever, they might have it in its milder form first, and carry that with them to the more unhealthy localities.

While the party at Shupanga enjoyed good health, notwithstanding the partial discontinuance of quinine, several cases happened on board the steam-vessel. We may mention that the accommodation on board was both very scanty and very uncomfortable. Water running into the cabin while the vessel was under steam, so as to keep the beds constantly wet

beneath; fortunately the weather was dry, or the rain would have poured in from above also, as we subsequently experienced.

Mr. R—, the engineer, had taken quinine with unvarying regularity, had an excellent appetite, and seemed to enjoy the climate; in working the engine he was obliged to see the fire lighted at 2½ a.m., in order to have steam by 7 a.m.

An officer had shifted his bed through the night, so as to prevent Mr. R— getting his clothes, and he proceeded to light the fire in his shirt; the consequence was pains all over the body and limbs, the bones being especially sore, the face flushed, eyes suffused, headache, and quick pulse. The bowels had been regular, and the tongue clean. A pill composed of resin of jalap, calomel, rhubarb, and quinine, which had formerly been found efficient in fever, was given, more as a precautionary measure, than from a belief that this was a case of the complaint. It seemed more a common cold than the African fever. As soon as the remedy had operated, the symptoms abated. Quinine was then given, and one dose of ten grains produced severe cinchonism, from which, when he recovered, he was quite well without loss of strength.

Towards the end of the rainy season the members of the Expedition were divided, those who had previously suffered from fever remained at Tette, while we went down the Zambezi to the sea, and explored the River Shine, both very unhealthy districts. While one of us was exposed to sun and rain navigating the vessel, and ashore superintending the wooding, the other was engaged botanising among grass jungles and mangrove swamps. Yet both of us escaped entirely. The use of quinine had been completely abandoned, and we are inclined to attribute our good health to the regular and active exercise which both these occupations imply. In this respect our experience corresponds with that of the Portuguese residents, who assert that while actively employed they enjoy good health.

While we explored the high lands around Lake Shirwa the steam-vessel was left in the River Shine, under the care of Quartermaster Walker. We were absent twenty-four days, Walker was seized with fever the day we left: it commenced suddenly, though he had taken quinine regularly. On our return we found that he had been delirious most of the time, and the fever had shown no signs of abating; but the action of purgatives, followed by quinine, soon restored health, and in subsequent attacks, when at the sea-coast, among the mangroves, no difficulty was experienced in cutting short the attacks at the beginning.

Our own experience in the high lands between the Shine and Lake Shirwa during twenty-four days, when we were exposed in the early hours to the dew from the long grass, continuing the march without interruption throughout the remainder of the day over rough country under the tropical sun, and then sleeping in the open air, and yet enjoying perfect health, as did also the natives who were with us, shows clearly that there exists within a short distance of the coast a healthy region well suited for the residence of Europeans.

This region is elevated above the sea from 3000 to 4000 feet, and shut off from the coast lands by the range of high mountains to the east of Lake Shirwa. It is of easy access by the Shine, which flows at the foot of the hills, and is navigable the whole distance. To the north, the southern extremity of a chain of lakes, which extend far into the interior of the continent, reach within thirty miles of the River Shine. This elevated region may be looked on as the entrance, by means of these inland seas, to a great part of Central Africa, cut off hitherto from communication with European nations by the unhealthy lands which bound the coasts.

The result of our experience has been to discontinue the daily use of quinine. It had been persevered in long after the conviction of the members had been against its prophylactic power. It is our conviction that we owe our escape from the disease far more to the good diet provided for us by H.M. Government than to the use of quinine. We have been as fully exposed to the malarious influence as any party is likely to be. The vessel in which we have had to navigate is one which takes in so much water that our beds are constantly damp, and often rotten beneath, with a quantity of water in the bilge of the ship. Yet we have found the fever quite amenable to treatment when taken early, and attention paid to any local congestions which may manifest themselves.

Let it not be thought that we undervalue quinine, to it we trust for the removal of the disease when given after purgatives; in all forms of the fever we have found it of the greatest value, and three doses have always proved sufficient to induce the constitutional action even in those who have not been taking it previously.

We have found the fever assuming a formidable type only when permitted to go on unchecked for some time in those exposed to great fatigue, damp, and poor diet, or when the irritable state of the stomach prevented the administration of quinine.

In regard to the complications most frequently seen, among ourselves vomiting has been the most troublesome, and blistering over the stomach has seemed the best means of stopping it. We have fortunately escaped without more serious inflammatory lesions of the internal organs; but among the Portuguese two cases have been observed with pneumonia; both proved fatal—the tartarate of antimony seemed to have no effect, while stimulants were equally powerless when once sinking had commenced. Enlargements of the spleen, when of recent date, have yielded quickly to the use of the sulphate of iron and quinine.

The ship's company, consisting of Krumen, have showed no greater immunity than the Europeans. The experiment of quinine was made with them, but its prophylactic action proved equally feeble as in our own case.

In future Expeditions of a similar nature, we beg to suggest that the work of the contracting ship-builders be more scrupulously tested than it had been in our case, when the defects once observed completely baffled all attempts at remedy.

Zambezi, July, 1859.

CLINICAL MIDWIFERY.

By ROBERT LEE, M.D., F.R.S.

Obstetric Physician to St. George's Hospital, London.

(Continued from p. 378.)

Case 591.—January 25, 1850. Mrs. T—, aged 25, at the full period of her first pregnancy. Labour commenced this morning at five, but she had slight pains for some time before. She had not suffered from headache during the latter months of pregnancy. Began to complain of headache soon after the labour commenced, pains feeble and irregular. At ten a.m. had a fit of convulsion, there had been twelve fits during the day. Mr. S. ruptured the membranes at five p.m. He attempted to do so at one, but the os uteri was so high up that he did not succeed. Soon after the rupture of the membranes pains came on, and the child was expelled dead at nine p.m. The placenta soon followed; she was insensible and had fits up to the time of delivery, occasionally. Half-an-hour after delivery she had a violent fit, but has had none during the night though extremely restless, attempting to get out of bed, till this morning. A severe fit a quarter of an hour ago, a little before ten. The pulse being still full, I recommended ʒiij of blood to be removed by cupping, and the head to be shaved and covered with ice in a bladder. The fits ceased. Œdema of the legs had been observed during labour. It had not been noticed before. January 28.—Is now recovering in the most favourable manner.

Case 592.—On June 30, 1845, I was requested to see Mrs. D—, aged 34, to determine, if possible, whether pregnancy existed. She had been married thirteen years, had enjoyed good health and the catamenia had been regular from the age of fourteen and a-half to Christmas, 1854. She had consulted a Medical Practitioner, who prescribed some medicine, after assuring her that the symptoms did not arise from pregnancy. I found the upper part of the vagina nearly closed up with extensive and hard cicatrices, and was then informed that many years before she had suffered from abscesses about the pelvis, and this was the only circumstance that could be learned to account for the existence of these cicatrices. The lower part of the vagina was widely dilated. From the condition of the mammae, and from feeling the body of the uterus enlarged and a moveable body within it, and the state of the os uteri which it was difficult to reach, I concluded that pregnancy did exist, and that she was in the fourth or fifth month. It was considered upon the whole more prudent not to induce premature

labour, but to allow her to go to the full period, in the hope that the cicatrices in the vagina would yield to the pressure and allow the head to pass. On the morning of October 18, 1845, the labour had continued two days and three nights, and there had been no progress for twenty-four hours, and it had become obvious that the cicatrices would never yield or allow the head to pass. There was likewise reason to believe from the factor of the discharge and the other symptoms that the child was not alive. I therefore perforated the head and cautiously extracted it. The placenta was retained, and required to be removed artificially. No hæmorrhage followed. Recovered favourably.

Case 593.—On March 16, 1850, I was requested to see the same patient, who had been seized with uterine hæmorrhage in the seventh month of pregnancy. I found the os uteri dilated to the size of half-a-crown, and the placenta partially presenting. At four p.m. I ruptured the membrane in the hope that the head which presented would pass, but at eight p.m. the hæmorrhage continued and I opened and extracted the head. A portion of the placenta was adhering firmly to the uterus and was separated with difficulty. The patient had not a favourable recovery, but in the progress of time was restored to her usual health. The cicatrix and the partial placental presentation led to the measure here adopted.

Case 594.—On April 21, 1850, about half-past twelve I accompanied Mr. Morley to Frederick-street, Gray's-inn-lane, to Mrs. —, who had been in labour with her first child since the morning of Friday; he had not left the house for forty-five hours. The head presented; it was near the outlet. Pulse rapid; tongue furred; no sleep for three nights; in a state to demand immediate delivery; discharges offensive; the external parts in a condition to render it impossible to extract the head with the forceps without certain mischief; one of the ears felt with difficulty; the pains had nearly ceased. Delivery was accomplished by craniotomy at four p.m. The placenta not coming away, I passed up the finger along the cord, and felt the head of a second child. We resolved to leave the expulsion of this child to Nature, but in three hours it became evident that it would never be expelled without artificial assistance. The blades of the forceps were applied, and the head easily extracted. The child had been dead some time, which made me regret that the second child was not delivered likewise by craniotomy, as the first had been. The placenta being retained beyond the usual period, passed up two fingers of left hand and felt the edge of the placenta, seized it, and on employing slight traction the placenta of the second child came away,—that of the first retained. I resolved to extract it without delay. The left hand was passed up, and it was removed without much difficulty. I left the house at 9 p.m., all well. This patient recovered favourably, and has since had a living child without any difficulty.

Case 595.—At half-past six p.m. on April 22, 1850, I was called to see Mrs. F.—, who was eight months pregnant, and had been seized with violent convulsions. One pound of blood had been drawn from the arm, and leeches applied to the temples. The fits continued. She was with difficulty carried up-stairs, and placed upon the bed. I examined, and found the os uteri slightly open. The membranes were immediately ruptured, and a great quantity of liquor amnii escaped. Labour pains soon commenced; the fits ceased—only one fit after the rupture of the membranes; consciousness returned; child expelled alive at nine p.m. Soon after I left the patient in the care of two experienced Medical Practitioners. The pupils were dilated in this case. 24th.—The fits returned, and I saw her yesterday afternoon in a state of complete insensibility; she died at two p.m. The body was examined: water in the ventricles, and a quantity, I was informed, flowed from the spinal canal. No disease was detected about the cerebellum or medulla oblongata. There was an abscess, not large, in the right hemisphere of the brain, near the surface. This patient had suffered from attacks of insensibility after a former labour some years before. Slight paralysis took place, from which she had never wholly recovered.

Case 596.—At ten a.m. on April 23, 1850, I was called by Mr. Randolph to see a patient in the seventh month of pregnancy, who had been seized with convulsions at six a.m. The extremities were cold; the pulse feeble; the pupils were not dilated. Mr. Randolph had ruptured the membranes and applied leeches to the temples. 24th.—The child was expelled

dead at six p.m. The patient is now half conscious; no fits since the head of the child passed through the os uteri.

Case 597.—On April 29, 1850, I was called by Mr. Ince to see a patient in Bury-street, who had flooding after the birth of the child. The child had been born three hours before, and the hæmorrhage still continued. The binder, with a pad, had been firmly applied, vinegar and ice used, and brandy freely administered. A little draining was still going on. The pulse had returned when I saw her, and the great danger was over; and she recovered favourably.

Case 598.—On Wednesday, the 15th May, 1850, at a quarter-past ten a.m., I received the following note from an eminent Practitioner in Midwifery:—"I should wish you to come to me immediately, to a consultation. The case is one of placenta prævia, with the cord in the vagina." The following was written by me on a slip of paper, which is preserved, before leaving the house, which has not been transcribed into my journal:—"Hæmorrhage had ceased; the umbilical cord hanging down with feeble pulsation, a large loop. High up through the os uteri, which was rigid and not much dilated, size of a crown. At the anterior part of the uterus felt a hand; no head could be felt. There was little pain. The liquor amnii. Two fingers passed through the os uteri—the whole hand could not be introduced without immense force. A foot seized with some difficulty, but at last coaxed into the vagina, drawn down gently. The os uteri gave great resistance, and the nates could not be drawn through till nearly twelve or half-past twelve o'clock, and then not without the employment of great force. The trunk and superior extremities drawn through without difficulty. The head not drawn through the os uteri till one o'clock, and not till the face was turned round toward the back part, corresponding with the hollow of the sacrum. The placenta, of very great size, was soon detached and expelled. No hæmorrhage; child of course dead. Recapitulation—Prolapsus funis; hæmorrhage rather profuse; rigid, slightly dilated os uteri; arm presentation; turning without introducing the hand into the uterus; two fingers."

Case 599.—On the 8th of June I was requested by an experienced Medical Practitioner to see Miss —, aged 31. Mr. — "stated this to be a case of neuralgia. I found that the leading symptom was a violent pain in the back, low down, occurring chiefly in the evening, and that she was hysterical; she had suffered from neuralgia of the face. I found that the catamenia had always been regular, perfectly so till two months before; that they had suddenly ceased without any reason; that she had sickness in the morning, and that the pain in the back had ensued. I made an examination of the uterus: the hymen gone; vagina in the state in which it is in married women; lips of os uteri soft and thick; body of uterus anteriorly much enlarged. I had no doubt at this early period that she was pregnant. Glands around the nipples large; areolæ florid. I said to this lady, 'If you were married we could have no difficulty in accounting for this pain and the other symptoms, but as you are not married we cannot do so satisfactorily.' She burst into tears, and immediately handed her marriage-certificate to Mr. M.—, enjoining secrecy, which he promised faithfully to observe."

Case 600.—On June 7, 1850, I received the following letter from Dr. —, containing the history of an obscure and interesting case:—

"June 7, 1850.

"MY DEAR SIR,—My partner, Mr. —, was on Thursday fortnight past asked to see a poor woman, with what he considered sub-acute inflammation of the peritoneum, covering the uterus and threatening abortion. Within the last few days considerable œdema of the lower extremities has shown itself; and to-day I have carefully examined the case with him, but we are both much puzzled, and should feel truly obliged, if, in the event of your being in this neighbourhood, you would kindly examine her for us. The following is a brief abstract of the case:—

"Mrs. H.—, aged 22, was married four months ago, and states that she was last unwell a fortnight after that time, and since then has had morning sickness. Sixteen days ago, after rather severe exertion, she was affected with severe pain in the abdomen, which lasted about half-an-hour; she had afterwards a rigor, and a return of pain the following day, when she sent for Mr. —. When he saw her he found the countenance anxious, pulse quick and small, but no great amount of febrile disturbance. Considerable pain on pressure in lower part of abdomen, where the uterus could be felt

distinctly defined, its base extending above the navel. She was certain she had not quickened, and regarded herself three months gone, and stated that this large amount of swelling had suddenly appeared after the attack of pain the day before, having before that time been scarcely perceptible. Bowels were and had been much constipated, and the day after being first seen she had some bilious vomiting, but no sickness of any kind since then. The treatment has consisted of leeches to the abdomen, purgatives and purgative enemata, diaphoretics and anodynes. Under this treatment the pain has for the most part subsided, but still comes on in paroxysms as evening advances. Uterus is felt very prominent, and extending to midway between umbilicus and sternum, and the size of a large cocoa-nut; behind it there is considerable flatness. No fetal sounds can be heard, nor movement be detected; breasts are flaccid, and she affirms that they have never been otherwise. On examination per vaginam, a nipple-like projection is felt almost protruding from the vulva which appeared to be the posterior wall of the vagina, pushed forward by a large firm tumour in the hollow of the sacrum; the os uteri can be felt high up in front of this tumour, but is rather difficult to reach with the finger; it seems as if pressed flat against the pubis by this tumour.

"We are much puzzled as to what this tumour can be, and, indeed, with respect to the whole case; and should feel truly obliged if you can kindly assist us with your opinion, if you can give it without personal inconvenience.

"To Dr. Lee."

Yours most sincerely, —.

The patient had been married half-a-year, had ceased to menstruate three months before, and for six weeks the abdomen had been observed to be enlarged, and she thought herself pregnant. Fourteen days before, after strongly exerting herself in lifting a bed, she had severe pain in the abdomen, and the abdomen suddenly distended. I found it greatly enlarged, and there was a distinct fluctuation. It was impossible to pass the finger into the vagina, in consequence of its being pressed firmly against the right side of the pelvis by a mass, the nature of which could not be certainly determined. The labia were greatly swollen and hard. There had been a difficulty in getting the bladder relieved, and also in procuring alvine evacuations. The fluctuation in the abdomen and the sudden appearance of the enlargement fourteen days before, after exertion, at once led to the suspicion that the tumour was the over-distended urinary bladder, but a great doubt was thrown upon this by the positive assurance of the patient's mother, that the urine was passed freely; and, unfortunately, not having a catheter with me, therefore no attempt could then be made to pass the catheter into the bladder, and remove the doubt which hung over the case. I recommended that an attempt should be subsequently made to pass the catheter; but whether this succeeded, or was even made, I have not been informed, and I did not again see the patient, who died on June 23. The body was examined on the 24th. The tumour was the distended urinary bladder. The uterus was in the fourteenth or sixteenth week of pregnancy. No disease of any kind existed, except peritonitis. No retroversion of the uterus.

(To be continued.)

ON THE USE OF THE PREPARATIONS OF LARCH BARK IN PULMONARY HÆMORRHAGE, &c.

By OWEN DALY, M.D.

Physician to the Hull General Infirmary.

My attention was first directed to the preparations of larch bark by two papers which were published in the *Dublin Hospital Gazette*. The first a communication from Dr. Moore, read before the Association of the College of Physicians, and published in the *Gazette* for April 15, 1858. The second a paper by Dr. Hardy, Physician to the Hospital for Diseases of Children, Dublin, "On the Treatment of Purpura Hæmorrhagica," by the administration of tincture of larch bark, which appeared in the same journal for January 15, 1859. As notices of these papers have appeared in the half yearly abstracts, a summary of their contents will be quite sufficient for my present purpose. Dr. Moore states, "The thera-

peutical properties of the larch bark have been recently introduced to the Profession by Dr. Frizell, of Dublin, who having found a decoction of the inner bark of the 'Pinus Larix' very efficacious in his own person, thought it worthy of minute analyzation, and accordingly placed it in the hands of Dr. Aldridge, by whom it was found to contain, among other constituents, starch, gum, resin, and tannin." We are informed by the same writer that "Dr. George A. Kennedy has employed the extract of larch bark, and found it very efficacious in arresting epistaxis and intestinal hæmorrhage in a young man labouring under typhus fever." He has also prescribed it with much benefit in cases of bronchitis, with profuse expectoration setting in during convalescence from fever. Dr. Hugh Carmichael and Dr. Moore have also employed the extract with great advantage in cases of profuse expectoration streaked with blood, and Mr. Hardy relates four cases of purpura hæmorrhagica treated by the tincture of larch; the most complete success attended the administration of the medicine. Having, at the time these latter cases were published, an out-patient at the Infirmary suffering from pulmonary hæmorrhage, for whom I had, without the slightest benefit, prescribed all the usual styptics, I resolved to prescribe the tincture of bark. The patient was a female, aged 32, a widow in an advanced stage of consumption. She complained of great difficulty in breathing, of oppression at her chest, and of a constant cough, attended with expectoration of blood. The tincture of larch was ordered in twenty-drop doses every third hour in a little water; the relief was immediate; at the end of a week the hæmoptysis was entirely arrested; and her other symptoms were so much mitigated that she soon ceased to attend at the Infirmary.

The styptic properties of the larch bark had, in this case, so far exceeded my expectations that I thought it deserving of a more extended trial, and up to the present time, I have prescribed it in fifteen cases of pulmonary hæmorrhage. The cases have not been selected—some have been cases of active and severe hæmoptysis, others of a passive and more chronic character. I have also employed it in one very severe case of epistaxis, and in a case of chronic cystitis, and with the exception of this latter case, in every instance with the most satisfactory results.

In the first week of last August, I had five cases of pulmonary hæmorrhage under treatment at the same time—in two of these cases the usual styptics had been first employed, and a fair trial given to them before using the tincture of larch. I shall briefly relate these two cases, and the case of epistaxis.

Case 1.—On the 3rd of August, I was asked to visit an unmarried lady, aged 25, who had been suffering for several days from passive pulmonary hæmorrhage; she had hurried respiration and frequent cough, attended with expectoration of blood. She had had hæmoptysis on two previous occasions; both lungs were diseased, the left extensively, the disease having advanced to the formation of pulmonary excavations. The finger-ends were very much clubbed. Lead and opium were first prescribed, afterwards sulphuric acid; finding, however, after persevering in the use of each for several days, that the hæmoptysis still continued without any abatement, and that she was becoming weaker, the tincture of larch was substituted for the acid, and was given in half drachm doses every third hour. Two days after, the hæmoptysis had almost ceased, the sputa being only occasionally tinged with blood. The tincture was omitted for a few days on two occasions, and on each the expectoration became slightly tinged with blood; which, on the medicine being resumed, soon subsided. Latterly she has taken the tincture along with the infusion of cinchona.

Case 2.—The following case I saw in consultation with my friend Mr. Dix on the 31st of July. The patient was a married man, aged 28; active hæmorrhage had existed for a week. The blood coughed up was pure and unmixed. The hæmoptysis occurring every day or every other day, sometimes twice in the day and on one occasion three times, but never lasting for more than a few minutes at a time; on one occasion at least four ounces of pure blood were coughed up. The constitutional disturbance was very slight, the pulse rarely exceeding eighty; the cough was very trifling, more—to use his own expression—a "piffing" than a cough. The hæmorrhage was always preceded by a "spongy feeling" referred to a particular spot in the right side of the chest, whence the effusion evidently proceeded. In this case an excellent opportunity was afforded for testing the virtues of the tincture

of larch as a styptic, inasmuch as previous to its employment, lead and opium, gallic acid, the mineral acids and turpentine, had all been administered, and each persevered in for two or three days without giving any relief. On the 4th of August, the tincture of larch was prescribed in drachm doses every two or three hours given in water. The result was most satisfactory. The hæmorrhage, after the administration of a few doses, was completely arrested, and although nearly four months have elapsed, no return of the bleeding has taken place. The dose was gradually diminished, and after a time quinine was added to the prescription.

Case 3.—The last case I propose relating, is one of severe epistaxis occurring in a girl, aged 19. She stated that for several weeks past she had suffered from profuse bleeding from the nose, generally commencing in the evening, and on more than one occasion she had become quite faint from loss of blood. The bleeding was not vicarious, as she had menstruated quite regularly; her appearance was anæmic and indicative of great loss of blood. Steel and quinine in combination with sulphuric acid were prescribed and taken for a fortnight without the least benefit. The tincture of larch was therefore substituted in half-drachm doses every fourth hour. The bleeding was completely arrested at the end of a week; she, however, continued to take the tincture in infusion of cinchona for some weeks longer, and when last seen, on the 10th September, was very much improved in her general health. It would be not only tedious, but unnecessary, to take up more time by a relation of further cases; the refrain in each would be the same, an immediate and striking improvement in the patient's condition, the hæmoptysis in every instance yielding to the medicine, in some cases after a few doses; in others after a more prolonged exhibition.

To conclude, judging from the results of my own experience, I believe the tincture of larch will be found to be a most valuable agent in arresting and restraining pulmonary hæmorrhage. It possesses powerful astringent properties, combined with the styptic and slightly stimulating qualities of a terebinthinate, a rare combination, and one which appears to me to present all the requisites for a perfect styptic. By virtue of these properties, it acts as a mild tonic, improving and strengthening the digestive organs, while it does not interfere with the healthy and natural action of the bowels. Further, it is a palatable and pleasant medicine, having an agreeable balsamic "*pinie*" flavour, which is no slight recommendation in medicines of this class, especially when their continued exhibition must be persevered in for a lengthened period.

P.S.—I wish to add, that I have seen several samples of the tincture of larch; that which I have used is scarcely altered when added to water, which, I believe, is the best criterion of its goodness and genuineness.

CATARACT,—ABNORMAL POSITION OF THE CRYSTALLINE LENS, AND OF THE IRIS—

CO-EXISTENCE OF DIABETES—OPERATION—RESULT.

By HAYNES WALTON,

Surgeon to St. Mary's and to the Central London Ophthalmic Hospitals.

I DESIRE to illustrate two practical points,—the overcoming of a mechanical difficulty, by which I was enabled to adopt the method of operating most suitable to the disease; and the power of local repair in a state of system generally believed to be incompatible with such a result.

In the early part of last month, a mechanic, with cataract, 44 years old, but whose shrunken frame and worn countenance made him look twenty years older, was sent to me by Mr. Wiblin, of Southampton. Eighteen months prior, diabetes was developed and effected its usual ravages. Some five or six months after, the mistiness of incipient cataract came on. He was able to work at his calling of sailmaking till within eight weeks of my seeing him, when, with a severe diarrhoea of several days' duration, his sight rapidly declined, and he was soon blind.

These were the conditions when I saw him. There was complete lenticular opacity, yet sufficient evidence to show that the

rest of the eye was healthy enough to warrant an operation, and the only other abnormal appearance that I could discover was the bulging of the iris, apparently pressed by the cataract to a degree that seemed to touch the cornea, which was of full size and of average prominence. There was then, practically, no anterior chamber. There had been no subjective symptoms besides muscæ, which almost always invariably exist with cataract. Both eyes were alike. The diabetes was decidedly better, as manifested in the less quantity of urine passed, and rather less emaciation.

It was at once apparent that the eye was a difficult one to deal with, because there existed one of the greatest, if not the greatest, impediment to the ordinary operation of extraction, and, as regarded the operation for solution, success would hardly be expected, and certainly not the best success, for if nothing worse happened under its adoption, the iris would become adherent to the crystalline capsule. I have always found these parts to adhere, when in even partial contact, after an operation, and that sometimes without any evidence of inflammatory action. More than this, the cataracts had not undergone that amount of degeneration which would, in ordinary circumstances, induce me to select the solution method for an adult.

In order to render extraction available in analogous cases, the late Mr. Tyrrell introduced his combined operations of extraction and solution. His method consisted in a limited and cautious use of the needle to reduce the bulk of the cataract, so as to allow the iris to recede, and then, after four or six weeks, to extract. He speaks favourably of this.

In the cataract of early life, or in adults when the lenticular structure is much degenerated, a cataract can readily be acted on by the needle, without altering its position; but not so in what is called "hard cataract," that to which extraction is particularly applicable; then the risk of dislocation is most imminent. Any manipulation with the needle sufficient to bring into play the process of absorption is very likely to move the body of the cataract, after which dislodgment of it from its seat is likely to follow with the well-known sequel of evils. I resolved, however, to attempt extraction by making the required incision with the blunt-pointed cataract, or, as it is usually called, secondary cataract knife.

I made a very small incision with the point of the ordinary cataract-knife, and I found that more could not be done with safety to the iris, sufficient to admit the blunt-pointed instrument, with which I effected an ample section along the margin of the upper part of the cornea, without wounding the iris, and ultimately extracted the cataract entire, to my perfect satisfaction. This proceeding was much facilitated by an assistant steadying the eye with a pair of forceps.

I have several times, when performing the operation of extraction, and so doubtless have all operators, rather than cut off a portion of the iris, withdrawn the triangular knife, and completed the proceeding with the secondary knife. It is, too, well known that some of the operators of old, among whom was the late Mr. Alexander, always completed the section in this way. I am unaware, however, whether extraction has ever been executed in the manner I describe now as effected by myself, under such circumstances, and almost entirely with the secondary knife. I am most pleased with it, and the application will not end here. It is just one of those simple things that, although valuable and important, is overlooked one cannot tell how. It is possible that other Surgeons may have done the same thing, and not thought it worthy of record; and I give it publicity, not to establish priority, but to point out to those to whom it may be applicable, an extended means of practical surgical treatment. Again, it will give, I hope, assurance to very young operators not to scruple to resort to the secondary knife when it may be useful, not to squeeze a cataract through too small an opening, and not to cut the iris when it can be called into requisition to avoid these. It will prove, too, how freely it may be employed.

The best success ensued: when the eye was opened, a week after—only one was operated on—the cornea was quite healed without any prolapse of the iris. The pupil was central, and the man could see. I saw my patient for the last time a fortnight later, and he had undergone the usual rate of improvement in the state of the eye, and in vision, but, strange to tell, the iris was as prominent and as convex as before the cataract was removed. This upsets the theory of a prominent iris with the existence of cataract, being due to the pressure of the cataract.

A few words now on the reparative power in so reduced a frame. With increased opportunities for observation, I do not find that in what may be called debilitated constitutions the progress of an eye after extraction is thereby interfered with as my teachers had taught me to believe. I as often see tardy union of the corneal wound in those whom I would select as the most favourable subjects for rapid healing. I speak from actual observation on the point. Putting out of consideration very old age, I suspect that the condition of the eye, as affected by disease, is more concerned in the failure than is suspected.

In this patient the power of assimilation and of repair must have been very low; it would, I think, be difficult to select a state of constitution apparently more unfavourable, and although, perhaps under the circumstances, the issue may be exceptional, yet the fact of success possesses practical value.

69, Brook-street, Hanover-square.

ON THE RECENTLY PREVALENT MALARIOUS AFFECTIONS.

By THOMAS B. PEACOCK, M.D., F.R.C.P.

Assistant-Physician to St. Thomas's Hospital, and Physician to the
Hospital for Diseases of the Chest, Victoria-park.

(Continued from p. 455.)

Case 2.—Anæmia.—Purpura—Attacks of sickness and vomiting.—Systolic murmur in the region of the heart.—Death, with cerebral symptoms, in a person living in a malarious district.

For the notes of the following case I am indebted to my late Clinical Clerk, Mr. E. V. Utterson, now of Balham:—

T. W., aged 25, bricklayer, residing at Rotherhithe, admitted into Jacob's Ward, St. Thomas's Hospital, under Dr. Peacock, July 23, 1857. He states that he has been ill two months, and that his illness commenced with palpitation of the heart, and violent throbbing in the head, and some degree of pain and sense of constriction across the chest. For these symptoms he was treated at the Surrey Dispensary for about six weeks, but with no benefit. He at present complains of the same ague, palpitation, with throbbing and sense of confusion in the head. He has a very anæmic appearance, with a pale tremulous tongue and bloodless lips and gums. He complains of slight feverishness, with retching and sickness towards night, and of constant thirst. There are some purplish spots on the chest, which do not fade on pressure; but he is not aware how long they have existed.

July 25.—Seen by Dr. Peacock who dictated the following notes:—His face is very œdematous, and the lower eyelids ecchymosed. The bowels have been freely acted by a dose of calomel and rhubarb. Pulse feeble and irritable, 120. Tongue extremely pallid and somewhat dry and furred. The spots are found scattered over the thorax and upper part of the abdomen, between the shoulders and on the loins. There are none on the arms or legs. They vary in size from a couple of lines to half-an-inch in diameter. They are more or less elevated above the surface, and vary in tint from a mere discoloration of the surface to spots of a deep livid hue, and they do not fade on pressure. The cardiac pulsation is diffused over a large space, and there is much throbbing in the neck. The dulness on percussion in the cardiac region does not extend beyond the natural limits. There is a distinct systolic murmur audible over the whole præcordia, and this is most intense at the base. No decided second sound can be heard. The murmur is distinctly audible in the neck, but not at the lower angle of the left scapula. The splenic dulness is increased in extent, but the hepatic dulness not materially so. There is no œdema of the ankles. He denies having had any cold shivering, but he suffers occasionally from attacks of retching and vomiting, and states that he perspired a great deal at the commencement of his illness. He was directed to take five grains of quinine three times daily, and half an ounce of lemon-juice every three hours. To have the milk diet and some brandy.

July 29.—On Tuesday night he had a return of the vomiting; it came on suddenly, but he had no shivering, heat, or sweating at the time or after it. His general appearance is somewhat better. His face is still puffy

and anæmic-looking, but the ecchymoses of the eyelids have almost disappeared. His lips are very pale, and the tongue white and dryish; the pulse 120, sharp and vibration but feeble. The petechial eruption still exists on the skin, but it is less elevated and less livid. It has entirely disappeared between the shoulders and on the back. The liver and spleen continue enlarged and the abdomen tumid. The systolic murmur is heard over the whole præcordia, but it is loudest between the sternum and the left nipple; no distinct diastolic sound is audible. The entire cardiac dulness on percussion commences above at the fourth interspace, and it does not extend so far to the left as the line of the nipple. There is some blood effused beneath the conjunctivæ near the corner of each eye, and also in each lower eyelid. He continued in this state up to seven p.m. on the 31st when he was seized with a severe fit, after which he became very violent, calling out constantly, and being with great difficulty kept in bed. He rapidly sank, and died at one a.m. on the 1st of August.

It was subsequently ascertained that about twelve months before his admission into the Hospital he sustained a severe injury by some slates falling upon him, and that the palpitation of the heart first came on after he had exerted himself in carrying a child some distance. The post-mortem examination was made by Dr. Bristowe on the 3rd. The body was in pretty good condition; but anæmic and much decomposed from the heat of the weather. The calvarium and dura mater were natural; the brain unusually pale, both on its surface and internally, but otherwise healthy. The pericardium, heart and aorta, with the pleura, larynx trachea, and lungs were perfectly healthy. The liver was large, and the spleen several times as large as natural, and soft; but the peritoneum, pancreas, supra-renal capsules, stomach, and intestines were entirely free from appearances of disease. The kidneys were pale, but presented patches of tolerably deep congestion, but seemed healthy.

4th. The last class of cases embraces local neuralgic affections of a periodic character—headache, face-ache, etc., or spasmodic diseases assuming a regular period, etc. In one case, a patient who had long laboured under epilepsy, when residing in any aguish district became the subject of ague, characterised by the usual malarious aspect, and his epileptic paroxysms occurred regularly every other day. He did not remain under observation for a sufficient length of time to test the effects of treatment. In a second case, there was violent pain in the right hypochondrium, with jaundice, connected with an aguish condition, and which subsided under the use of quinine. In a third case, which should perhaps rather have been referred to under the second head, as there was marked fever, with imperfect exacerbations and remissions, the symptoms and signs of bronchitis, which had not been benefited by the usual treatment, subsided under the use of bark coincidentally with the relief of the febrile symptoms. I have also known pneumonia assume a periodic character, the disease making progress and the patient becoming greatly prostrated in one day, and all the symptoms being remarkably alleviated on the next, and this for several times in succession.

III. In the treatment of all these forms of affection, the chief reliance has been placed in the use of bark and the cinchona alkaloids. I have extensively employed all the three alkaloids—quina, quinidina, and cinchonia—in the form of disulphate, and I have also made trial of the quinoidine, or amorphous quinine, as it is supposed to be by Liebig. The latter is objectionable, from the difficulty of effecting its solution, and its unpleasant flavour; and it is so much less efficacious than the others, that, allowing for the increased dose it is necessary to employ, there is no economy in its use. The disulphate of cinchonia, is a more disagreeable bitter than the similar salts of quina or quinidina, and is probably more apt to disagree; it is less soluble, and, I have inferred, less active by about one-third. The quinidina and quina salts are very similar. Dr. Dundas Thomson informs me that all the specimens of quinidina which he has examined contain a considerable quantity of quina; and the two agree equally well, and may be regarded as equally efficacious both as tonics and antiperiodics.

1. In the cases of decided ague I have usually employed moderate doses of one or other of the alkaloids, as five grains of the disulphate of quina or quinidina, or six or eight of cinchonia, three times daily. With these doses it formerly rarely happened that the patients had more than one or two decided attacks

after the commencement of the treatment; but latterly the disease has evidently been of a more intense character, and patients often continue to have attacks for two, three, or four weeks, and some for even longer periods. On looking over the notes of sixty-seven cases, treated as out-patients during the last year, either by disulphate of quina or of quinidina, in doses of five grains, repeated three times daily,—the vehicle being in some cases the decoction of bark,—I find that in twenty cases the patients reported that they had no severe paroxysm after the commencement of the treatment; in nineteen the attacks had continued to recur for periods not exceeding one week; in six for two weeks; in nine for three weeks; in five for four weeks; in five for five weeks, and in three for six weeks; beyond this period there was no case in which the paroxysms continued to recur, provided the remedy had been steadily persevered with. When, however, the remedy has been suspended, or the dose considerably reduced, shortly after the cessation of the attacks, relapses have been of very general occurrence, and I uniformly persevere with the treatment so long as there is the slightest indication of the paroxysms, or the patient retains the malarious aspect though all other symptoms of disease have entirely ceased. The remarks which I have made refer entirely to the treatment of ague among the out-patients. When patients suffering under even decided ague are treated in the wards, it often happens that the paroxysms cease before any specific treatment has been had recourse to, or on the exhibition of small doses of the alkaloid; but such cases very often relapse if discharged without having continued the remedy for some time.

In some cases of ague I have made use of the larger doses of the alkaloids,—ten, fifteen, or twenty grains,—given immediately the symptoms of the attack manifest themselves; and such a plan not only usually lessens the duration and severity of the coming paroxysm, but the patient has seldom more than one or two subsequent attacks. In some cases, also, when the disease does not yield to the employment of moderate doses, the larger ones have been repeated twice or thrice daily.

When the patient comes under treatment immediately before the attack is expected, I usually direct a dose of opium—one grain of the solid drug—to be given immediately the symptoms manifest themselves, and this plan appears not only to mitigate the severity of the attack, but to assist the ultimate cure; and sometimes the opium has been repeated two or three times daily, or at the commencement of each paroxysm, and with beneficial results.

I have rarely made use of the liq. pot. arsenitis in cases of ague which have not previously been subjected to treatment, and then only in moderate doses,—six or eight minims three times daily,—and have not seen much benefit from its use, probably from the dose having been too small. It has not unfrequently been used, but also in moderate doses, and alone, or in combination with quinine, in cases of ague which have resisted quinine alone; but my experience of its use has not been satisfactory.

2. In the treatment of the cases of remittent fever, I have used small doses of alkaloid, repeated at frequent intervals,—one or two grains every two, three, or four hours, and sometimes even more frequently. Moderate doses,—four or five grains,—three or four times daily; and large doses,—ten, fifteen, or twenty grains, two or three times daily. In all these forms the remedy may produce its characteristic effects—nausea or sickness, singing in the ears, headache, vertigo, and deafness; and when the quantity given in the day is large, obstinate retching and vomiting, sometimes diarrhoea, severe pain in the head, transient insensibility, and tendency to coma, and great depression of the force and frequency of the heart's action. The production of the full physiological effects of the drug has been supposed to be necessary to the exertion of its therapeutical properties; but when thus exhibited its employment has been shown in the French Hospitals to be by no means without risk, and I doubt both the necessity and the desirableness of carrying the action of the drug so far. I have uniformly found that cases which have resisted the employment of quinine in moderate doses, and without the production of very decided symptoms of cinchonism, have equally proved intractable under the use of larger doses, and when the characteristic effects of the drug have ensued. I therefore generally prefer to employ the remedy in moderate doses, and only two, three, or four times daily. The

smaller doses have chiefly been tried when there was great irritability of the stomach, and prostration of strength, and when there was much difficulty in getting the remedy taken, but I cannot report satisfactorily of the results of the treatment.

In some cases when the moderate doses have been given, and at infrequent intervals, but when there has been distressing sickness and restlessness at night,—symptoms which there was reason to believe might be aggravated by the use of the remedy,—I have seen advantage from giving a larger dose once or twice in the earlier part of the day, and then exhibiting a decided anodyne at night. When also there has been much prostration of strength, and the fever has been more of the continued type, I have preferred exhibiting either the decoction or the tincture of bark, or both, to the employment of any of the alkaloids, and with satisfactory results; though, of course, the remedies require to be given in frequent doses. In all cases stimulants and support must be given according to the nature of the case; and in some instances, and especially after the paroxysms, they require to be most freely exhibited.

3. The anæmic cases were treated by bark, generally in the form of the decoction or tincture, or both, with small doses of quinine, acids, especially the sulphuric acid and lime-juice, and also in most cases with iron. In some instances, also, the quinine was given in large doses, and to the production of its characteristic effects; but the remedies employed seemed to have little, if any, influence in checking the onward progress of the disease.

4. In the cases of neuralgia, or headache—which were obviously but one indication of a generally malarious condition—the alkaloid was given at the commencement of the treatment; but in the more numerous class of cases in which the affection seemed to originate in rheumatism in an aguish habit, the patients were usually first placed under the remedies for rheumatism—gradually increased doses of iodide of potassium, with small doses of colchicum and alkalies. These were usually exhibited in decoction of bark, and morphia was given for the relief of the pain. If the pain did not readily yield under this treatment, moderate doses of quinine or quinidina were also given; and in all cases one or other of the alkaloids was exhibited to complete the cure and protect against relapses. I believe this plan to be generally preferable to that more usually followed of at once giving quinine in periodic neuralgic affections. When at first employed the doses of the remedy required must generally be very large, and yet the benefit derived is often not marked; whereas, when the employment of the alkaloid is preceded by anti-rheumatic treatment, the pain is usually very much relieved at once, and entirely disappears under small doses of alkaloid. I have seldom been induced by the distinctly periodic character of the pain, to commence the treatment by the employment of quinine, without having had to regret having done so; and I have repeatedly been rapidly successful in curing cases of periodic neuralgia by the plan named, though they had entirely resisted the use of large doses of quinine.

THE UNIVERSITY OF BRUSSELS.—On November 20, the University of Brussels will celebrate the twenty-fifth year of its foundation—for it was twenty-five years since the Belgian Liberals determined upon establishing an University, which, consecrated solely to Science, should afford to human reason its entire rights of free discussion and examination—morality and honesty of purpose imposing the only control; progress and truth being the only aim. Glory to those enlightened men who so well appreciated the want of their time, for to them Belgium owes an institution which, we venture to say, excites the admiration of Europe, and wherein is trained that new generation which will perpetuate the generous principles it has there imbibed. During this period the University has become the centre of Belgian Liberalism, and has been its very keystone, resisting alike the ill-will of pretended friends, and the avowed hostility of natural enemies,—continuing in spite of all obstacles, with a firm and steady step in the road of progress and prosperity. Formerly held up to parents as a bugbear, it has now acquired general sympathy, and every year the students have increased in number; coming not only from all parts of Belgium, but also from the various countries of Europe, and even from the New World.—*Presse Médicale Belge.*

PRACTICE OF MEDICINE AND SURGERY.

ROYAL
LONDON OPHTHALMIC HOSPITAL.

ACUTE IRITIS IN A SYPHILITIC INFANT.

(Under the care of Mr. DIXON.)

ANOTHER interesting example of that rare affection, acute iritis in an infant, has just occurred among Mr. Dixon's patients. As is almost invariably the case, the disease was associated with the symptoms of congenital syphilis in a most well-marked condition.

M. L., aged 7 weeks, was admitted on Thursday, September 20. She was moderately well grown, and, though pallid, not by any means approaching the condition of syphilitic marasmus. Her nates, arms, hands, and face, were, however, covered with patches of copper-tinted psoriasis of unmistakeable aspect. There was psoriasis plantaris, and the nails both of fingers and toes were all of them diseased, shrivelled, and in process of separation (syphilitic onychia). She had bad "snuffles." Her mother stated that when born the infant was fat and apparently healthy, and that she remained well until three weeks old, when the snuffles, eruption, etc., made their appearance.

The state of the eyes was such, that by a cursory examination the real nature of the disease might very easily have been overlooked. There was scarcely a trace of that zonular injection of the sclerotic which is so common a symptom of syphilitic iritis in the adult. It appeared that the child had been under mercurial treatment. The attack in the eyes had commenced ten days before, and, as the mother described it, "a circle had formed round the black spot of the eye." A Surgeon, to whom she applied, ordered some powders to be taken night and morning. The left pupil had now cleared, but in the right some distinct specks of white lymph still remained. Both irides were muddy and deficient in brilliancy. There was no intolerance of light. Mr. Dixon ordered a quarter of a grain of calomel every night and morning. On September 24, the rash on the body was much better, and the lymph on the right pupil, with the exception of one little speck, was wholly absorbed. The calomel was now suspended, and the mild mercurial ointment was ordered to be used every night. On November 3 the note states that the eyes appeared to have wholly recovered. Atropine was used, and the pupils dilated fairly, without exhibiting any remains of adhesions.

The above case gives us an example of syphilitic iritis in the infant of unusually mild character. It is also instructive as an example of the rapidly beneficial influence of mercurial treatment. Had the mercury not been prescribed when it was by the Medical man, whom she consulted within a day or two of its commencement, there would have been great risk that a much larger amount of lymph would have been effused, and that great difficulty would have been encountered in procuring its absorption. The importance of carefully inspecting the eyes of syphilitic infants can scarcely be over-stated, since the ostensible symptoms of a congestion, intolerance, etc., are in most cases almost wholly absent, and there is but little to attract the attention of either mother or Medical man to a lesion, which may be rapidly tending to destroy vision.

It is an interesting fact respecting the syphilitic iritis of infants, that in a majority of cases the subjects are of the female sex. In a paper upon it, published in the Ophthalmic Reports by Mr. Hutchinson, sixteen cases were collected; about half of them having occurred under the writer's own observation. In two of these, taken from previous writers, no mention was made of sex. Of the remaining fourteen, four only were boys and ten girls. Since the publication (a) of Mr. Hutchinson's paper, we have recorded three additional cases, and the subjects of all these were females. The numbers now stand as four to thirteen of the respective sexes.

EXTENSIVE LACERATED WOUND ACROSS
THE CORNEA—PROLAPSE OF IRIS.—RECOVERY
WITH MOBILE PUPIL AND GOOD SIGHT.

(Under the care of Mr. DIXON.)

Robert W., aged 20, was admitted on August 11, on account of a wound of the right eye. He stated that at three o'clock on the previous day, while engaged in lowering a railway-carriage, a heavy piece of iron had been struck with great violence against his eye. Immediately after the blow he tried the eye, and found that although he could distinguish light he could not see any object. He remained at work with the eye covered with a piece of rag, during the remainder of the afternoon. During the night he had a good deal of pain.

On admission a rather jagged wound was seen to extend horizontally across the middle of the cornea, through its entire width. The aqueous humour had escaped, and the iris was bulged forward in contact with the cornea and the wound. The pupil was occupied by white opaque lymph, and it was supposed that the lens had been injured. There was considerable congestion of the eye. The treatment adopted consisted in carefully closing the lids by strips of adhesive plaster. Ten minims of the liquor opii sedativus were ordered three times daily, and he was directed to abstain from all stimulants, but to take an ordinary meat diet. It should be stated that he was a florid, healthy-looking man, of steady habits. At his next visit, three days later, the condition of things was satisfactory, in that there was no further tendency of the iris to bulge into the wound, nor any excess of inflammatory action. The cornea was still quite flaccid.

On the third visit, a week after the accident, the opium was suspended, the pain having quite subsided; at this time the cornea was still flaccid, but the wound in it appeared to be healing.

We need not enter into any detailed account of the events during the next month. No medicine was given; nor, excepting the precaution of keeping the eye perfectly closed, were any topical remedies employed. At the end of three weeks the wound was soundly healed, and the lymph in the pupil was, to a large extent, absorbed. The cornea was now regaining its convexity, and the strapping was laid aside.

On October 5, the following note was made: "A horizontal cicatrix extends along the middle line of the cornea, the iris is adherent to the cicatrix at parts, but not so at the upper and lower edges of the pupil, which are mobile. He can see large objects. No lymph remains in the pupil, and the lens, if present, is not opaque."

On November 3rd (three months after the accident) the eye had recovered to a most surprising degree, and the man could read minion type with ease. The cicatrix across the cornea extended from side to side, exactly in the horizontal plane, thus crossing the middle of the pupil. It occasioned, however, merely a line of opacity, the corneal structure closely adjacent to it being perfectly transparent. The iris was in contact with the cicatrix, and united to it from its circumference to the margin of the pupil on either side. Thus the pupillary edge was left free in two semicircles, one above and one below the cicatrix. Both of these moved easily under the stimulus of light.

We quote the case as an excellent instance of the reparative powers of nature when not interfered with. Had the case occurred twenty years ago, without doubt the man would have been bled and leeches, and subjected to the influence of mercury; now, however, the opinions of ophthalmic surgeons are quite changed on this matter. We hold that mercury does little in preventing the effusion of lymph after injuries; and we know also that in many cases, if things be let alone, entire rest being the only measure insisted on, that no inflammatory action beyond what is simply reparative will ensue. The change in practice applies equally to traumatic lesions, and to wounds caused by the Surgeon's knife; and in no department of Surgery do we see its advantages more frequently or more forcibly exemplified than in that which concerns the eye. Of course, if, after the extraction of a cataract, or an accidental wound of the cornea, inflammation should set in, the prompt application of leeches will be of great importance. A large majority of such cases will, however, if the part be kept carefully quiet, if a good nutritious diet be allowed, and the patient avoid any irregular use of stimulants, do perfectly well. If either local or general depletion be resorted to

without absolute necessity, by tending to enfeeble the patient, they undoubtedly increase the risk of destructive inflammation; the weak and the debilitated are emphatically those most liable to such attacks. In the above case, in which the result was as perfect as anything could have been, the patient was a florid, well-fed man, from whom, if it had been necessary, no one would have feared to abstract blood.

The plan of treatment which the case illustrates is the one always followed out at this Hospital, the closure of the lids by strips of plaster being its chief feature. We have often heard those members of the staff whose experience extends over a long series of years speak most positively as to the superior results obtained by it, as compared with that formerly in vogue.

THE PROVINCIAL PRACTICE OF MEDICINE AND SURGERY.

LEICESTER GENERAL INFIRMARY.

TWO CASES ILLUSTRATING THE RECURRENCE OF MALIGNANT DISEASE, AFTER THE REMOVAL OF THE TESTIS FOR CYSTIC SARCOMA.

WE published last week (see p. 458), a case in which a man whose testis had been removed for cystic sarcoma, died afterwards of the development of cancer in internal organs. We have now to add further particulars to two cases which appeared in our statistical report on this disease (see p. 287, Sept. 17), in both of which a like event followed. Cystic sarcoma when simple and uncomplicated is not usually a malignant affection, and the records of cases show that patients from whom such specimens have been removed remain well permanently. On the other hand, it has been fully recognised by Mr. Curling, our great English authority on this subject, as well as by other observers, that there is a form of cystic disease, in which the cysts contain medullary cancer. In these cases the patient's progress is generally in conformity with the usual course of malignant disease. When, therefore, we meet with instances in which the removal of testes said to be specimens of cystic disease have the sequela of cancer, we naturally suspect that the original tumour must have been of mixed character. In the case which we recorded last week the original tumour had, however, been most carefully examined by Dr. Ransom and Mr. Wright, with a view to the determination of this point, and with a decided conclusion, that no cancerous element existed in it. In the two following cases, our authority on this point is Dr. Sloane, the able Resident Medical Officer of the Leicester Infirmary.

Case 1 (Case 4 in previous report).—A man, aged 43, apparently in good health, was admitted, under the care of Mr. Benfield, with the account that his right testis had been enlarging for more than four years. It had now attained the size of two fists; the cord was healthy. Mr. Benfield removed the diseased gland, and the wound healed well. A gland in the groin, which was at the time of the operation somewhat enlarged, increased subsequently, and a month afterwards had attained the size of a hen's egg. The man, when he left the Infirmary, was in excellent health. Dr. Sloane reports respecting the examination of the tumour in this case, that he made a most careful one; that the tumour, which was pear-shaped, contained three cysts, the largest of which was filled with a cheese-like matter, and the two smaller with a soft pulpy substance. The cell-structures, found in the contents of the cysts, resembled under the microscope tessellated epithelium. Juice scraped from freshly-cut surfaces, as well as thin sections from the denser portions of the tumour were placed under the microscope, but in none was a characteristic cancer-cell detected.

With regard to the further progress of this case, Dr. Sloane informs us that the man lived eighteen months after the operation. As his home was fifteen miles from the Infirmary, he was not able to attend for several months previous to his death. When last seen, however, the lumbar glands were much enlarged, and there was also an indurated mass in the groin on the side from which the testis had been removed. No post-mortem was obtained, but there could be no doubt his death was from malignant disease.

Case 2.—This case is that of a healthy man, aged 47, under the care of Mr. Macaulay. The enlargement of the testis had commenced about five years before, and the gland on admission was the size of an infant's head. About four ounces of serum were drawn off from the tunica vaginalis on the day prior to the operation. The testis was excised in the usual way. The cord was tied *en masse* by a strong ligature. Before the man's removal from the operating-table, this ligature slipped, and it became necessary to lay open the inguinal canal, in order to secure the bleeding vessels. Considerable oozing from the bottom of the wound continued for about five hours after the operation. He recovered well, and left the Hospital. Dr. Sloane writes that he has not preserved any further notes respecting the examination of the tumour, beyond the fact, that it was "an example of cystic sarcoma." The man only lived for about a year after the operation, and died from the development of malignant disease internally. Shortly before his death, a tumour developed itself over the sternum, and rapidly attained a very large size.

In both these cases the patients are stated to have been in good health at the time of the operation, and since in both the duration of the disease had been protracted (four and five years respectively), it is difficult to reconcile this fact with the idea of malignancy in the primary disease. Cancer of the testis is, perhaps, the most acute of all forms of cancer, and very rapidly deteriorates the general health. At the same time it must be admitted that the tumour in the first of the two cases, since it contained only three cysts, was not a well characterised example of the disease known as cystic sarcoma. In the second case also, the very large size of the tumour is a suspicious fact. Such cases, though exceedingly instructive in themselves, ought, perhaps, not to be allowed much weight in influencing our prognosis respecting the future of patients from whom well-characterised examples of cystic sarcoma have been removed. In the latter the cysts are usually very numerous indeed, and the tumour, instead of tending to indefinite growth, usually increases in its solid parenchyma, and but rarely, we believe, attains an ultimate bulk larger than an adult fist. (a)

NOTES AND QUERIES.

He that questioneth much shall learn much.—Bacon.

No. 380.—THE LENTIL.

SIR,—Will you allow me to inquire if any of your readers can give me information or references respecting lentil-flour, with some notice of the plant, its habitat, and in what it differs from other leguminous plants in the chemistry of its fruit? Also reference to the use of protein as a remedial agent, and the readiest and cheapest method of procuring it sufficiently pure for this purpose. Nickel has been used in medicine. Which salt? What is the dose, the indications of its use, and the effect obtained? Can anyone give me references to any experiments on the transplantation of the cornea in animals?—I am, &c.

HEBETUDO.

No. 381.—CURIOSITIES OF FRENCH MEDICAL LITERATURE.

SIR,—Permit me a query. Why cannot a Frenchman copy an Englishman's name correctly? There is something really strange in the fact: that our French friends insist now, as they have always insisted, in rarely giving us one true cognomen. Can any of your readers give an explanation of this psychological obliquity? We rarely ever find an Englishman miswrite the name of a Frenchman, and for this reason we think the queer figures French authors make us cut hardly fair. A page of a journal—*L'Union Médicale*—lies before me, from which I learn that M. Léfort, Aide d'Anatomy of the Faculty of Medicine of Paris, places upon the Bureau of the Society of Chirurgery of Paris, a voluminous memoir on resection of the knee. He contents himself, however, with reading a *résumé* of the same—a piece of modesty which, by the way, might occasionally be usefully practised in some of our own learned Societies. Running my

(a) For an interesting case with remarks respecting this process of solidification of cystic sarcoma of the testis, see *Medical Times and Gazette* August 7, 1852, page 139.

eye down this page of *résumé*, I find the names of my blessed departed countrymen thus handled. *William* Wright took off five and a-half inches (in 1738) from the femur of a boy called Herd Ramsden. In 1739 Benjamin Gooch, assistant to Dr. Amyas, of Norwich, did something of a like kind. In 1760 *Waisman de Shispton* (*Angleterre*) cut away some of a humerus. In 1762 *Pelkin*, Surgeon of *Nortorich en Cheshire*, first commenced resecting manœuvres on the knee, and then Bent, of Newcastle, and Owed in 1778 renewed attempts on the shoulder. Owed, however, in 1773, was the first honourable resector of the wrist. And in 1782 Moreau did a great thing without knowing it had already been done in England, three years before the translation of *Parck's* memoir appeared in France. Lastly turns up M. Jones de *Gersey*. A little further on I hesitate, for I may be in error, if I surmise that M. *Euchsen* means Mr. Erichsen. I think, sir, you will agree with me that there is something queer in the typographical bumps of men, who slaughter our countrymen's names in such a fashion.

W. O. M.

No. 382.—MR. SENTIMAN'S CURE FOR THE AGUE.

"The Princess Anne, finding her son afflicted with the ague in 1694, sent for Mr. Sentiman, an Apothecary, and required him 'to give her a prescription approved of by her uncle, Charles II. ;' for, her Royal Highness said, 'it cured every kind of ague.' Mr. Sentiman had the recipe for the nostrum, which was a mixture of brandy and saffron. It made the poor child excessively ill, but did not cure him."—*Queens of England*.

No. 383.—HOUSES OF FAMOUS DOCTORS.

At No. 142, Cheapside, Sir Richard Blackmore, the poet, once carried on the profession of a Physician. Linacre lived on the site of No. 5, Knightrider-street, Doctors'-commons—the house was bequeathed by him to the College of Physicians. Dr. Arbuthnot lived in Dover-street, Piccadilly, second door, west side. Dr. Mead, at No. 49, Great Ormond-street. Dr. Jenner, at No. 14, Hertford-street, May-fair. Dr. Baillie died at 25, Cavendish-square; and Mr. Abernethy, at 14, Bedford-row.

No. 384.—HARVEY'S PORTRAIT.

In a late number of your valuable publication a correspondent, "W." writes, respecting an engraving of the portrait of Harvey, from the painting formerly possessed by Dr. Mead. I should be greatly obliged by your correspondent informing me whether he considers this painting more eligible than that in the possession of the College of Physicians, more likely to be well received as an engraving by those to whom a portrait of Harvey would be a work of interest.—I am, &c.

THE ENGRAVER OF THE MODERN COMPOSITION.

No. 385.—LONDON AND ITS QUACKS A CENTURY AGO.

"The great success of quacks in England," wrote Adam Smith in 1774, "has been altogether owing to the real quackery of the regular Physicians. Our regular Physicians in Scotland have little quackery, and no quack, accordingly, has ever made his fortune among us." And a few years earlier, in 1762, Dr. Fordyce speaks thus of the Profession in London: "There is nothing new here either in physic or chemistry; in physics we are all quacks; and some particular treatment of our own, which nothing would make us alter, does everything in every case (warm water and bleeding for ever). You cannot imagine the number of alchemists we have in London. One Gardner, a silversmith, whose business was worth to him £1500 a-year, has lately been ruined by it, and a great many others. I believe there is a scheme of making a Medical School in London after the peace."—*Letter to Dr. Cullen*. [Adam Smith forgot to mention that his countrymen's poverty was a reason why they did not indulge in the luxury of quackery.]

No. 386.—PORTRAIT OF DR. LOCK.

"In the *Times* of July 29, there appeared a notice of Lord Northwick's sale of pictures, wherein Lot 232 was described as follows:—'Hogarth; Dr. Lock, the founder of the Lock Hospital, a plan of which he holds in his hand. The celebrated picture came into possession of the late noble owner from the collection of Sir John Thorold.' Now Mr. Peter Cunningham, in his excellent 'Handbook of London' (*voce* Lock Hospital) tells us that 'the Loke or Lock in Kent-street, in Southwark (from which the present Hospital derives

its name), was a lazar-house from a very early period,' etc. Other writers give the same account. Is it possible that within a century the name of a founder of a public Hospital has become mythical? or are we to look upon Dr. Lock as a merely imaginary personage, and this picture, by Hogarth, accurately authenticated, as possessing the same degree of historical value as might be assigned to an original portrait of Mrs. Harris?"—*Athenæum*.

SATURDAY, NOVEMBER 12.

MANLY VIGOUR AND SILENT FRIENDS.

We have often had occasion to illustrate the ingenious methods, adopted by the Manly Vigour and such-like quacks, of relieving their victims both of their present and their prospective cash. It is easy to understand how young men are led to give "post-obits" for the sake of present enjoyments; but that they should be brought to sacrifice the means of existence in the future, for the sake of removing evils which have no existence except in their own imagination, appears to us to be an incomprehensible refinement in the art of folly. The advertising quacks of the "Manly Vigour" School must have the merit of suggesting the invention to the unwary of the rising generation. The facts which our Law Courts occasionally disclose, and the still more numerous facts which come to the professional ear, sufficiently prove how successfully these gentry lay their plans. They know, and they act upon the knowledge, that there are men who will willingly sacrifice all their means to ward off the fear of impotency; and who consider no sacrifice too great, if they can thereby ensure their complete purgation from the dreaded ravages of syphilis. The motto of the fraternity is,—*"The patient's infirmity is the quack's opportunity."* And this is the only explanation that can be given of the many cases of swindling which are daily perpetrated under the guise of philanthropy. One knows not, in considering them, which most to admire and wonder at,—the supreme credulity and blindness of the duped, or the audacity and transparent roguery of the duper. It is not improbable that the gains of these pseudo-Medical sharpers exceed that obtained through the machinations of all the other numerous quackery-mongers of the metropolis; which is saying that the gains are enormous. The law is impotent for their annihilation; and still permits them to ply their unhallowed trade with impunity. The press lends itself most largely to the furtherance of their designs. There is therefore nothing left to the Medical Journalist, in the present state of things, but to guard the timid and unwary youth against their toils. It certainly is no great credit to the public journals of this country, which set themselves up as the arbitrators of right and wrong, and as patterns of virtue and uprightness, that they should be mainly and pre-eminently the means through which this enormous system of swindling and villany is furthered and promoted. If there were no advertising and puffing of the wares and the false doings of these men, there would be no catching of the dupes. The

guardians of the public morals—the Press—are they who profit most, next to the quacks, out of the proceeds of all this foul and dirty work! It is actually a fact, that many journals owe their very existence to the proceeds of these disgraceful advertisements. They actually live and breathe through the insertion in their columns of filth which no decent man would allow to be read in his house. We can only raise up our hands in wonder at the amount of dirt which men will swallow for the sake of money, and of degradation which they will undergo.

In all shapes and forms Quackery encircles the youth of this country—advertises itself to his notice. A most insidious specimen of this kind has just been put into our hands, and we think it worthy of special notice. The author of the following note addresses himself thus to each Freshman of the University of Cambridge (doubtless of Oxford too):—

“Dear Sir,—If the book to which the accompanying notice refers treats on matters indifferent to you, I pray your pardon for directing your attention to it: if, unfortunately, you have a special interest in the subject, perhaps you will not censure me for having done so. “I am, yours faithfully,

“T. H. Y.”

Dr. Yeoman, M.D. Glasgow, residing in Lloyd-square, London, is the author of the above interesting invitation. What the nature of the book is to which he refers we need hardly tell our readers. It of course treats of “*Debility and Irritability, Mental and Physical, induced by Spermatorrhœa*,” etc. etc. Fifth Edition. Price, 2s.; by post (only from the Author), twenty-six postage-stamps.

In the notice thus forwarded to each said Freshman, the Freshman is told how the Doctor first became learned in this decent department of his trade. In 1829—thirty years ago—

“A valued friend and fellow-student made me the confidant of his sorrow and its cause, and I became the medium of communication between him and one of our most esteemed teachers at the Medical School of the London Hospital.”

This will show the *length* of his knowledge on the subject; the *breadth* of it may be gathered from his extended fields of observation, *hic et ubique*, in Paris, Glasgow, Spain, and North and South America. But even thus armed with a world-wide knowledge of varieties of spermatorrhœa, the Doctor hesitated in proclaiming his knowledge before the face of a critical Profession.

“In consequence of sordid and vile pretenders having claimed generative arrangements a *specialité* for their unholy enrichment; in consequence of many of our best and most able practitioners having ignored Spermatorrhœa as a special and direct cause of much mental and bodily ailment,—it required some moral courage for a qualified physician and a gentleman to advance before his brethren, and front the ignorant extorting creatures who injure and dupe a too credulous community. To interfere with and interrupt their dirty work was at one time considered a sure way of soiling yourself. That such is not, in fact, the case, the fourth edition of this work testifies.”

His success is evidently his justification. And now in a fifth edition he feels compelled, through the impulses of gushing love towards his younger male species, to rush to their rescue from the hands of sordid and vile pretenders; to open to the afflicted ones a parental refuge of advice; and to suggest to the yet untainted a ready prospective cure for their future possible evils. He is “pained,” as he says, “to find so much self-caused misery existing among our fellow-creatures, and so much ignorance and extortion practised by the vampires who pollute the newspapers of the day with their disgusting,” etc. And then to prevent any possible mistake as to his own position, he tells the fresh youth what a high man he is:—“My professional reputation renders it unnecessary—had I the vain desire—to descant on the success of my practice; but I must be permitted to add, that each day’s experience confirms the value of the treatment detailed in the following pages.”

We have not noticed this pretty little specimen of professional business for the sake of amusing or astonishing our readers, but purely to warn those of our brethren who may be unaware of it, of the fact, in order that they may exert their influence in frustrating the works of this valiant yeoman of Medicine. Here is, indeed, the sublimity of puffing! The injury which is thereby done to nervous youths will be readily appreciated by men of Medicine. As will be seen by reference to the notice, a most abominable insinuation is suggested to the mind of every young fellow who goes to Cambridge, and no doubt many a one who has never had a day’s illness in his life, is in consequence, led to reflect upon some thing which may have at one time or other occurred to him, and becoming frightened, has fallen into the hands of gentry of the species here indicated. And all this, too, done under the guise of the highest professional repute and position! A slap in the face given right and left to the “sordid and vile pretenders;” and exclamations of pity for a “too credulous community!”

POOR-LAW MEDICAL DEPARTMENT IN IRELAND.

OUR attention has been called to certain proposed retrenchments in the Medical Department of the Irish Poor-Law system. In the late Annual Report of the Irish Poor-Law Commissioners, a section will be found on “Amendments of the Poor-Law and Medical Charities Acts,” in which it is proposed to abolish the present staff of Medical Inspectors; this is conveyed insidiously enough in the recommendation that the Medical Inspectors, under the Medical Charities Act, be authorised to act under the Poor-Law Acts also. But the import of the change intended is best seen by reference to the letter of the Commissioners to the Chief Secretary in November, 1857, in which they observe that “a separate staff of Inspectors specially charged with the duties under the Medical Charities Act is not necessary,” and “that one Medical Inspector would appear to be sufficient to meet the exigencies arising under the Medical Charities and the Poor-Law Acts unless when cholera or other epidemics may break out, when special temporary services may be readily obtained.”

Now, the *gist* of all this, it cannot but be seen, is the ultimate abolition of some four Medical posts of great responsibility and practical importance, with emoluments of about £500 a-year each; all opposition to be apprehended from the present occupiers of these offices to be silenced by merely altering their duties from those of Medical to those of general Poor-Law Inspection. No more insidious policy could be well imagined, or one more likely to impose for the time on the uninformed credulity of the authorities of the State, or to pass unnoticed by the heedless indifference of the Profession to all attempts made upon its interests that are not of a glaringly aggressive character.

That there may be no doubt as to the intentions of the Commissioners, we may state that it appears that, in anticipation of their recommendation of 1857 becoming law, provision was made in their estimate for the salary of one Medical Inspector only.

There are several reasons for which we object to the retrenchments here proposed. In the first place, and we state it broadly and without hesitation, the prizes in the Medical Profession, furnished by places of even moderately respectable emolument, like those in question, are too few already, and we will not consent to their diminution. In the next place, we deny the premises of the Commissioners, that the services of Medical Inspectors are no longer practically found requisite. *Prima facie*, 163 workhouses, and 776 Dispensary establishments, present material for perpetual inspection by competent Medical authority, which it is simply impossible for one Medical man to accomplish, even if he travelled without intermission the whole year round. As for inspection of

Workhouse Infirmaries and Dispensaries by *laymen*, it cannot but be, under any circumstances, an utter sham. But for more cogent reasons still we must resist any attempt to reduce the number of Irish Medical Poor-Law Inspectors. Is the state of the all-important subject of Vaccination in Ireland such that no increased vigilance is required on the part of the Poor-Law authorities? We know on good evidence that it is not; and that work for even more than four Inspectors lies undone in this direction. Perhaps it is because the Poor-Law Commissioners, instead of taking large and enlightened views of their duties, and using the abilities of the able Medical Inspectors under their control in furthering these and other questions of a hygienic, sanitary, and preventive nature, are puzzling their brains with crabbed calculations how they may reduce their estimates, and this at a time when such narrow notions are but little encouraged in any department.

We trust that our Irish brethren will make a manful and united resistance to this insidious invasion of Professional rights and emoluments. They may calculate on our cordial sympathy and co-operation.

THE WEEK.

CONSIDERABLE discussion has been excited, as our readers are aware, as to the future continuance or modification of the *British Medical Journal*. At a late meeting of the Rochester, Maidstone, Gravesend, and Dartford District Meetings, a conversation took place upon the discussion which has lately occurred in reference to the *Journal*, when it was proposed by Mr. Fry, seconded by Dr. Martin, and resolved *nem. con.*—

“That this meeting desires to express its high value for the *British Medical Journal* as the organ of the Association; and that it would see with regret any change which would either diminish the size or the frequency of publication of the *Journal*.”

Sir Henry Cooper, of Hull, probably represents a more general feeling in the Association in the following letter. He says:—

“Our Society has been formed on the model of, and (with special adaptation to Professional objects) is similar in its objects to, the British Association for the Advancement of Science. This Society has no *Journal*; its funds are expended in grants for conducting scientific inquiries and observations, and in furthering the ends of science socially and politically. The American Medical Association—a strictly kindred society to our own—follows the same system; and both publish their results in an annual volume of ‘*Transactions*,’ the value of which is undeniable. I need scarcely suggest in how many ways pecuniary assistance from the funds of our Association would assist the progress of Medical Science, and add to our political force and social status. This branch of the subject is capable of great development, but I forbear to enter on it now.

“Practically speaking, it must be admitted that we expend our available income upon the *Journal*. On an average of years, the net income has not materially exceeded the cost of producing it. Is it wise to expend our strength on the vehicle, and, in so doing, debar ourselves from producing, in its best possible form, the material which it is to convey? Would it not be better policy to divide our resources; to expend part on securing valuable and reliable matter, and part in circulating it among our members? The converse of the present system should then be adopted. Instead of begging for contributions to supply a stated demand for publication, we should publish as often as materials of sufficient interest and value were collected; and the interval required for this purpose would soon be determined.

“In short, I would advocate such an issue of the *Journal* as would diminish its cost one-half; and I would expend the balance in the manner above indicated, and in the occasional issue of a volume of ‘*Transactions*.’

“I think it would be well that this question, being now well considered, should be brought prominently before the Branch meetings which immediately precede the annual

meeting, so that the feeling of every section of the Association should be represented there.”

We some time since called attention to the startling assertions made by Professor Liebig in his little work last published on Agriculture. According to his views—and, we confess, quite in accordance with the reason of the thing,—all Europe is preparing for a great calamity, by the determined manner in which we engulph and waste our manure. Things may go on smoothly enough for a time, the Professor tells us, so long as guano comes freely to us; but the supply of that article is limited, and will one day cease, and then we shall find to our cost what reckless spendthrifts we have been. Ancient Rome, he cries out, cast all the riches of the Campagna into the Tiber through its mighty sewers, and having drained Sicily and Africa in a like way, at last fell through want of corn. We are glad to see that the advanced agriculturist Mr. Meechi endorses the sentiments of Liebig; and comes forward in defence of cesspools. Our readers will see the sort of figure at which he puts the annual value of our wasted manure:—

“At the meeting of the Braintree Agricultural Society, Alderman Meechi remarked that Boards of Health were being established throughout the country, and they were excellent sanitary arrangements so far as concerned the general health; but they might depend upon it they were having an evil influence as to the furnishing of the British stomach, and the doing away of all cesspools deprived agriculture of an important manuring resource. He did not think he could illustrate it better than by comparing the loss of the sewage of the 15,000,000 inhabitants living in towns to feeding 15,000,000 sheep, and throwing all their manure into the nearest river. The farmers said they were producing more corn than they used to do, but he was not prepared to admit that. Mr. Caird, in his book, a few years ago, told them that Arthur Young estimated the amount of wheat grown in England in 1770 at 2,000,000 quarters more than we now produced, for they must bear in mind that we were now importing 10,000,000 quarters of corn annually.”

Flogging in the Army is still reported as an operation going on at Woolwich and elsewhere. An excellent specimen of its benefit is shown by the case of a man who has lately been subjected to the disgraceful torture. It is thus reported:—

“The artilleryman, William Davis, recently flogged at Woolwich Garrison, and whose case evoked a large amount of public sympathy, on account of the peculiar cruelty of the punishment, deserted from the regiment a few days after his release from hospital, and has not since been heard of. Before leaving Woolwich he stated that he had such a dread of the lash that he would sooner be shot than remain a soldier. Every kindness and attention was paid to the man after he left the hospital; and, in consideration of the unhealed state of his back, he was ordered to be relieved from drill. It is believed that no steps will be taken for his apprehension.”

With the approach of another Parliamentary Session, Mr. Griffin renews his exertions in favour of Poor-Law Medical Reform. He has prepared the “Draft of an Act for the Better Regulation of Medical Relief to the Poorer Classes in England and Wales, an Amendment of the Vaccination Acts, and other Measures of a Medical character for the welfare of the people.” This draft is altered and amended in accordance with the suggestions offered to Mr. Griffin from various quarters; and he now believes that he has reconciled many conflicting views, by throwing out some objectionable clauses in his former draft, and by introducing some new and important features. As it is not certain that the present President of the Poor-Law Board will fulfil the promise made to the Poor-Law Medical officers by his predecessor, and introduce into Parliament a measure of reform, Mr. Griffin proposes that some independent member should be prevailed upon to take

up the subject in the House of Commons. Hitherto the oracles of Whitehall have given only evasive responses to the pertinacious inquiries of Mr. Griffin as to their intentions in the ensuing Session, and indeed they appear to have done little more than to acknowledge the receipt of his communications—a duty which they never omit to perform with the greatest punctuality. Hence, Mr. Griffin very properly urges that the Medical officers, by their union and determination, must exercise a gentle pressure upon the timid and reluctant officials, and thus induce them to arouse from the apathy into which they have apparently allowed themselves lately to relapse. Mr. Griffin thinks it unadvisable to call the Union Medical officers together, in consequence of the expense which would attend such a course; but he invites their renewed attention to the subject of Poor-Law Medical Reform by sending the Draft Act to such as are subscribers to the Association or have been elected since January, 1858. He regrets that he cannot send a copy to all, but he does not feel himself justified in incurring a further outlay upon those who have hitherto rendered no pecuniary or other assistance to the cause. It is further stated that for some months past, very few subscriptions have been received, and the printing and postage of the Draft Bill will entirely exhaust the resources of the Association; the Poor-Law Medical Officers and the Profession generally, are therefore, earnestly entreated to render their aid in order to carry on the agitation with vigour and success. "No one," says Mr. Griffin in his circular letter, "denies the justice of our complaints; but Parliament requires us to prove our case; we must, therefore, again and again if needs be, publish our grievances, and send a copy of our proposed Bill to each Member of Parliament, with a commentary on it—which cannot be done without money; a few shillings from each Union Medical Officer is all that is required." The aim and object of the agitation is to increase and equalise the Poor-Law salaries, and to elevate the position of the Medical Officers in the opinion of the world, by which means collateral benefits will be conferred upon the sick poor, and ultimately upon the ratepayers themselves.

In our number of the 29th ult., we called attention to the extraordinary proceedings of a person who appears to be usurping the name of Mr. Colston, a Member of the College of Surgeons of England, for the purpose of puffing himself off as a curer of deafness in all its stages. During the past week, we have received a communication from a correspondent in the country, inclosing a manuscript letter, purporting to be written by the same individual to a gentleman afflicted with deafness. This person signs himself "S. Colston, M.R.C.S.E.," and dates from No. 6, Leicester-place, Leicester-square, London, the name and designation being almost identical with those of Mr. Henry Samuel Colston, whom we know to be a member of our Profession. This letter laments, in a pathetic manner, the sufferings of the many victims to deafness, and the merciless manner in which they are plundered by parties described as "London Aurists and Advertising Pretenders." This expression of tenderness is somewhat extraordinary, as the writer professes to be an aurist himself, residing in London, and, as we have previously shown, advertises very largely, and publishes printed lists of persons who have been cured by his wonderful remedies. "I can assure you," continues the writer, "I can readily sympathise with the afflicted, and feel proud I am in possession of means to effect speedy cures, and in inveterate cases such relief that places sufferers in a position not to have occasion again to apply to any of these pretended aurists." It is then announced that the expense of the remedies and attendance will be £2 3s., and that all the medicines will be forwarded with full instructions. It must be observed that hitherto the writer alludes to the

"remedies," but in the next sentence he feels happy in stating his complete confidence in "its" efficacy; so that we are left in doubt whether he is in possession of some one invaluable elixir for the cure of deafness, or whether he calls in the art of polypharmacy to his aid. We may parenthetically mention, that we once had occasion to examine some of the remedies sent by this same party, and found them to consist of a packet of lint and a little olive-oil, together with some common blistering ointment, and a few powders, apparently consisting of cream of tartar. However this may be, it appears that these appliances are very expensive, and are obtained only with great difficulty; for, says the writer, "I am daily incurring great expenses in procuring the remedies from abroad and preserving them in the natural state also in giving publicity to this important discovery all of which make the expenses about £35 a-week indeed I would not continue to administer this relief to deaf sufferers unless I was assisted by some of the most influential men in London the small charge named is only to cover the expense it will cost me and my professional attendance to the case," etc. This confusion of the singular and plural, the want of punctuation, and indeed the whole style of this extraordinary epistle, cannot fail to excite surprise, and perhaps amusement. The letter is exactly like that of an ignorant and unprincipled empiric, and we cannot believe that Mr. Henry Samuel Colston, M.R.C.S.E., had any hand in its composition. We again express our opinion that he ought to denounce the impostor who is making such an unjustifiable use of his name.

A German Military Surgeon, after explaining in the *Wiener Wochenschrift* the immense labours of himself and colleagues after the slaughter of Solferino, adds:—"I hope that at last authority will consider us, and ameliorate our position. Four Physicians in Chief are spoken of, one for each army. The number of *Médecins-majors* ought also to be increased, and the position of the Assistant-Surgeons improved, giving them the rank of Lieutenant. The Surgeon ought at once to become Commandant in rank; and the head of the whole body should have the position of Field-Marshal." From this it would appear that the German Military Doctor, as well as the French, has got his griefs.

The following extracts from a long correspondence, speak for themselves. The subject is one of the utmost importance.

"To the President, Vice-Presidents, and Council of the Royal College of Surgeons of England.—We, the undersigned, being Members of the Royal College of Surgeons of England, resident and practising in the Dudley district, having learned that Mr. George Horton and Mr. Richard Meredith, who are now officiating in this district—the former as an Assistant, and the latter as a Druggist—are about presenting themselves for examination for the Membership of the College, beg most respectfully to represent to your learned Council, that neither of those gentlemen having passed through any portion of the Curriculum of Study which the Council prescribe, their admission would be a manifest injustice to us, and all other Members of the Profession, who have, with more or less sacrifice, laboured through the course of probation hitherto demanded by your regulations.

"Dudley, October 14, 1859.

"James Fisher.

"Samuel Day Fereday.

"Daniel Timmins.

William C. Garman.

William Synes.

"I regret to say this petition has never received any reply. Now it is quite clear that one of the gentlemen named therein (from his own testimony) had an interview with either the President or Vice-President of the College, on or about the 20th of October, in reference to his admission, and he was

then informed by them or the Secretary that he could not be admitted until the petition which they had received, and which was numerous and respectfully signed, had been presented to the Council. This appears to have been done; but the result is that, since its presentation, that gentleman has received his diploma, and is pronounced 'fit and capable to exercise the art and science of Surgery,' *without his ever having attended a single course of Lectures or Hospital Practice*. For, and on behalf of, the members who signed this requisition, may I ask if this procedure is fair? Is it just? If so, then let the privilege be at once made general and extended to the as-well-deserving hundreds, who no doubt would willingly afford the *fee*, and which would appear to be the only and real value which the College authorities now take into consideration for their diploma.

"I am, &c., Yours truly,

"M.R.C.S. (by examination) in Anatomy,
Physiology, and Surgery.

"P.S. I enclose my card.

"Dudley, November 7, 1859."

The Council of the College *must* give some explanation as to this statement.

REVIEWS.

A Practical Account of General Paralysis, its Mental and Physical Symptoms, Statistics, Causes, Seat, and Treatment. By THOMAS J. AUSTIN, M.R.C.S. Eng., lately Medical Officer at Bethnal-house Asylum. Pp. 225. London: 1859.

THE general paralysis of the insane, although well known to the Medical officers of Lunatic Asylums, and well described in the works of several Continental Physicians, is too little understood in this country, and its features, especially those of its early stages, are often mistaken. Essentially a most formidable and fatal disease, its early recognition is of the utmost importance in forming a prognosis in the case of insane patients, whose chance of recovery will very materially be influenced by the presence or absence of this terrible complication. Hence any contribution to the literature of general paralysis must be acceptable to the Profession, although, as we have just mentioned, the disease has already been exceedingly well described by some foreign psychologists. Mr. Austin, however, does not avail himself of the labours of his predecessors, nor does his work give any indication that he has derived his information from foreign sources; but he presents us with a very able sketch of this malady, founded upon his own personal experience in the treatment of the insane.

Mr. Austin divides the disease into three stages, which indeed are not very distinctly separated by any well-defined boundary, but pass into each other by imperceptible gradations. The first stage is that which is most difficult of recognition, being often overlooked by the friends of the patient, and even by his Medical attendant, and it may be said to continue until the full establishment of the symptoms. The second stage extends from the development of the disease until the period when all the faculties of the mind give way, and dementia succeeds. The third and last stage passes on to utter mental and bodily helplessness, until death closes the scene from the utter exhaustion of the patient. Throughout the melancholy progress of the case there may be alternations of exuberant high spirits and hypochondriacal despair, of distinctly-marked paroxysms of insane violence and of delusive lucid intervals; but the course of events is the same in the end, for the bodily and mental powers are gradually more and more impaired, until they both become a mere wreck, and nothing human, except the outward form of humanity, is left to the unhappy sufferer.

Many of the symptoms of the disease, described by Mr. Austin, and many of his opinions regarding its nature and pathology, are decidedly original; but we are not inclined to endorse all his statements, until they have been confirmed by the researches of other inquirers in the same field. Among the earliest indications, Mr. Austin lays great stress upon the condition of the iris; and he states broadly, that in all cases of general paralysis, at some period of the disease, the mobility of this structure is lessened, or its symmetry is disturbed. In

the great majority of cases, this diminished mobility or damaged symmetry is permanent, although it is rarely equally evident at all times; and the pupils of the two eyes are differently affected. Mr. Austin thinks he has observed, that "when the right pupil has been the more affected, the *general* tone of the delusions has been melancholic; and with a more implicated left pupil, their *usual* complexion has been elated, and their colouring gorgeous." This statement, we think, requires confirmation, nor are we inclined to admit the following conclusions drawn from Mr. Austin's researches:—

"From the coincidence of affected right pupil with mental depression, and of affected left pupil with elation, I draw the conclusion, that the ganglia of pleasure and pain are on different sides of the encephalon. A chain of reasoning of which these facts are the premises, and the revelations of early autopsies, have led me to the further conclusions—First, that the right thalamus is the ganglion of natural painful, and the left thalamus that of healthy, pleasurable emotion; secondly, that the marked melancholic and elated mania, so characteristic of general paralysis, are the results of morbid changes respectively in the right and left thalamus; and thirdly, that disease of these great central ganglia is to be regarded as the primary physical cause of the malady, as the focus whence disorganisation or degeneracy spreads to the adjacent ganglia and commissures."—P. 188.

The fifth chapter of Mr. Austin's book extends to seventy-eight pages, and is occupied with the details of twenty-six cases, in which the symptoms during life and the appearances observed in the brain after death have been carefully noted. There can be no doubt that the safest method of arriving at correct views of the pathology of cerebral disease is by an accurate record of *post-mortem* appearances, and Mr. Austin deserves the thanks of the Profession for his labours in this direction; nevertheless, we cannot help thinking that his cases hardly warrant the conclusions which he draws. Unless in the instances of the occurrence of tumours, *ramollissement* and hæmorrhage into the brain, or of the effusion of pus or serum into that organ, the necroscopical appearances are too faintly marked, or are liable to so many fallacies that no very definite inferences can be drawn as to the connexion between supposed morbid conditions and vital manifestations. Such terms as *too small* and *too large*, *too hard* and *too soft*, and the like, are so vague that a cautious pathologist would hesitate to rank such conditions among the pathogenetic phenomena of the brain, especially since those who are acquainted with the *post-mortem* appearances in insane patients are aware that all such varying conditions are continually found in cases which during life presented the most heterogeneous or opposite symptoms. Moreover, if a pathologist will compare a given number of brains of insane patients with an equal number of brains taken from other subjects, he will often be puzzled to point out the distinguishing marks which characterise the victims of insanity.

Notwithstanding these remarks, it is a very legitimate object of inquiry to investigate the morbid appearances of general paralysis, and, if possible, to determine its seat. The researches of Mr. Austin will probably stimulate the inquiries of others in the same difficult field, and if such labours should result in the establishment of some definite principles upon the nature of a very mysterious and fatal disease, a real benefit will accrue to Medical Science.

The Natural History of the European Seas. By the late Professor EDWARD FORBES, F.R.S. Edited and continued by ROBERT GODWIN AUSTEN, F.R.S. Pp. 306. London: 1859.

THE present volume is the second of a series published by Van Voorst in illustration of the Natural History of Europe. The first volume was on the vegetation of Europe, and was written by Professor Henfrey, whose recent loss the scientific world has had reason to deplore; the second, on the Natural History of the European Seas, was commenced by Professor Edward Forbes, but was interrupted by the untimely decease of that distinguished naturalist. The completion of the volume, however, has been entrusted to Mr. Godwin Austen, who was the friend and literary executor of Edward Forbes, and who has carried out the original design with great ability and success.

The natural history of the ocean was the favourite pursuit of Professor Forbes, who, whether arranging the specimens

in a museum, or in writing works illustrative of marine animals, or in dredging the waters of the European seas, was alike in an element congenial to his tastes. The consequence has been, that, in his descriptions of the inhabitants of the deep, there is a freshness, vigour, and originality, combined with scientific accuracy, which has never been surpassed by any other naturalist, and which give such a charm to his writings as to make them equally appreciated by the cursory reader and by the cultivated student. The design of the present volume is ingenious and original; and instead of a bare enumeration of genera and species, we have presented to our view an animated picture of the oceanic races, sporting in their native element, attaching themselves to certain regions, or, in the case of fishes, making extensive migrations from sea to sea; some of them, as the testaceous animals, clinging to the rocks and shores, and others floating about upon the waters, glittering by day with all the colours of the rainbow, or relieving the darkness of the night with their phosphorescent illumination.

Professor Forbes completed about half of the volume, and it is only doing justice to the present Editor to state, that the remaining portion, although somewhat differing in style, is not at all unworthy of that which precedes it.

Phthisis and the Stethoscope; or the Physical Signs of Consumption. By RICHARD PAYNE COTTON, M.D., Physician to the Hospital for Consumption and Diseases of the Chest. Second Edition. Pp. 80. London: 1859.

IN this little work, which—although called a second edition—is in reality entirely re-written, the author seems to have discovered the art of writing concisely, yet sufficiently, for the information of the Medical Practitioner; and he has reached the point of usefulness without running into prolixity. Dr. Cotton does not profess to give a manual of physical diagnosis; he merely arranges and explains the successive pulmonary phenomena accompanying the different stages of phthisis. He studiously avoids theoretical discussion, and simply records facts, without staying to speculate upon them. In the first chapter we find some useful information upon the general conformation of the tubercular thorax, and we are informed that a misshapen or deformed chest is far from a common occurrence in the wards of the Consumption Hospital. Upon the subject of Percussion we notice some practical and novel views, the author regarding this mode of exploration as a less important part of diagnosis than is commonly supposed. Bronchophony also is similarly estimated, and plain reasons are given for the opinions expressed.

This book being rich in practical remarks, and free from stethoscopic refinements, cannot fail to be useful both to the Student and the Practitioner of Medicine.

ANOTHER triple birth is recorded as occurring recently at Sheerness; and has been noted by a Royal Bounty of 3*l.* to the prolific parent.

SMALL-POX IN MARYLEBONE.—Mr. Wilson, the Registrar of St. John, Marylebone, who registered a death from small-pox last week at 47, Princes-street, thus writes:—"About six weeks ago a gardener living at 48, Princes-street, Portman-market, was attacked by small-pox of a severe character, but recovered. The disease spread, and on the 29th of September the daughter of a railway porter, aged 8 years, on the 5th of October, the son of the same railway porter, aged 16 months, and on the 10th of October, the son of a journeyman plumber, aged 18 months died of it, all in the same house (No. 48). It then appeared in the next house (No. 47), where the child of a journeyman bricklayer, who was attacked on the 13th of October, died on the 25th of October, and the father of the same child, who is out of work from the present strike in the building trade, was taken ill of the small-pox on the 18th and is still under the attack. It will thus be seen that in rather less than a month small-pox of a virulent character attacked six persons in two adjoining houses, of whom the four children died. Some other cases, although not of a fatal character, have appeared in another part of my sub-district. It should be added that some of the children whose deaths are recorded had been very imperfectly vaccinated, some not at all, and others only after the appearance of the epidemic."

PROGRESS OF MEDICAL SCIENCE

Selections from Foreign Journals.

ON SOME OF THE ACCIDENTS PRODUCED BY THE DEVELOPMENT OF THE WISDOM-TEETH.

By M. ROBERT.

THE four last molars, vulgarly termed "wisdom-teeth," frequently cause, by reason of their slow development, various accidents which the treatises on Surgery pass by almost without notice. An interesting and useful monograph might be written upon the subject.

These teeth are short and broad, and have short and straight fangs. They seem to remain behind the others, both in regard to their dimensions and the period of their apparition; so that at first sight, these teeth, which seem to have, so to say, undergone a commencing atrophy, might be expected to make their appearance without inducing irritation. But there are various circumstances which may render this difficult or even dangerous. Thus, it often happens that at the period of the evolution of the large molar it is found to have undergone deviation. As it is always cut at a late period, the other teeth, situated in front, compress its follicle, and distort and thrust back its alveolus. The tooth is thus often found deviating in front or behind, within or outwards. So great is the deviation that the alveolus is occasionally found hollowed out in the ramus of the jaw, the tooth having undergone such a reversion that its crown abuts directly against that of the second great molar. It is easy to see that the eccentric movement executed by the wisdom-tooth at the moment of its evolution, may become, as regards the neighbouring teeth, the jaw, mouth, gums, or even itself, the source of various more or less serious accidents, such as osteitis, periostitis, necrosis, inflammation of the soft parts, etc. This will be easily understood, if we consider the enormous power exerted by the tooth, the effects of which cannot be better compared than to those exerted by water, which, infiltrated into the crevices of rocks, violently separates their fragments, on expanding during congelation.

To these accidents of an inflammatory nature, must be added another, which is hardly ever absent, and which often exists alone during a variable period, viz., the pains that sometimes last for months or years, and depend solely upon the development of the wisdom-tooth. This persistent pain is a nearly certain sign of chronic inflammation caused by obstructed evolution; but sometimes this phlegmasia, under the influence of some slight appreciable cause, or sometimes without any appreciable cause at all, may become transformed into acute inflammation, giving rise to various serious affections of the hard or soft parts as necrosis, periostitis, abscess, etc. Abscess may form either at the exterior of the jaw, or towards the mouth, whence the pus detaching the muscles and aponeuroses, may descend to the neck. In a case of Bérard's, the pus of an abscess which had formed in the mouth, descended to the subclavicular region, constituting a true migratory abscess, from the effects of which the patient succumbed. Sometimes it is on the side of the throat that the inflammatory symptoms are manifested, and then the enlarged tonsils may have to be excised. In other other cases it is towards the velum or the uvula that the inflammation is directed. Thus, an instance occurred to the author in which this was the case, and the hypertrophied uvula, hanging upon the base of the tongue, gave rise to anorexia and vomiting, and other symptoms, which during several months gave rise to the belief in an affection of the stomach. They arose, however, from the inflammation excited by evolution of a wisdom-tooth; and when analogous symptoms are present, at an age in which such evolution takes place, its possibility should always be borne in mind.

These observations were suggested to M. Robert by the presence in his wards of three persons in whom the development of the wisdom-tooth had given rise to various accidents. One of these was a delicate youth of 22, who had suffered from severe pains in the mouth during several weeks. In the furrow between the cheek and the anterior border of the ascending ramus was a vast and very painful ulcerated surface, covered with a whitish deposit; and, lower down, the

gum behind the third molar was likewise painful and swollen. The ulceration had been caused and kept up by the swelling of the gum, which itself depended upon the development of the wisdom-tooth. It was proposed to modify the condition of the ulcer by means of fuming nitric acid, and to freely excise the gum over the tooth. In the second case, a woman, aged 22 or 23, had suffered severe pains at the angle of the jaw during two years, and had every now and then inflammation and abscess in the vicinity. The gum had been incised with temporary relief, and now, after a severe attack of inflammation had been subdued, the tooth was found to be partially through, the gum which covered the remainder being ulcerated. This was excised, and the symptoms all subsided. In the third case, a robust man, aged 32, had suffered from his mouth, at the point corresponding to the last molar, during two years. Abscess, followed by an obstinate fistulous opening, occurred: but as the fistula opened near the chin, and all the teeth were sound, even an experienced dentist had not suspected the true cause. Another dentist, recognising the nature of the case, drew the second molar, in order to give room for this new one, but without avail. The patient then came to M. Robert, who at once recognised that he had a dental fistula. These fistulæ have, in fact, their peculiarities, being slightly depressed, with the skin around them plaited or wrinkled, and when lying on the lower jaw frequently adhering to the bone. The fistula was traced back with a probe to the tooth, and the latter having been extracted, recovery soon took place.—*Gazette des Hôp.* No. 8.

HEREDITARINESS OF THE EPILEPSY INDUCED IN THE GUINEA-PIG.

By M. BROWN-SÉQUARD.

One of the most interesting facts among those discovered by M. Brown-Séquard, is the production of epilepsy in the mammalia, and especially the guinea-pig, as a consequence of certain lesions of the spinal cord. He has frequently repeated these experiments, and with the same results. At a recent meeting of the Biological Society he related the results of the observations he had made during several years upon the young ones born of parents thus rendered epileptic. In some of these he has met with a very distinct epileptiform affection, with well characterised paroxysms, but differing somewhat from the epilepsy of the parents. In the latter, not only are there spontaneous paroxysms, but others may be induced at will, by irritating or pinching the skin of the face; but in the pigs which appear to derive their convulsive affection from their parents, paroxysms cannot be induced in this manner; while the form of those occurring spontaneously is not exactly the same. The animal is first seized with trembling, and then falling on its flank it agitates its limbs spasmodically. The young pigs thus affected have proceeded in about an equal number from epileptic mothers and fathers. Sometimes parents thus rendered epileptic by myelo-traumatism produce little ones, none of whom exhibit the affection, or while some do, others do not. M. Brown-Séquard has had under his observation a very large number of guinea-pigs, and while not denying the possibility of the fact, he has never seen a single animal present an analogous convulsive affection, unless it had previously undergone a lesion of the medulla, or was the offspring of a parent who had been rendered epileptic in this manner.—*Gazette Hebdomadaire*, No. 44.

HYDATID TUMOURS.—M. Wunderlich relates the following case:—A young man, aged 22, entered the Hospital, complaining of headache, vertigo, etc. On examination, two large tumours were discovered—one in the epigastrium, and the other in the right iliac fossa. He was feverish; his feet were cedematous; and there was albumen in his urine. The tumours gradually increased, and at length the patient died. Two days before his death he was suddenly seized with great pain in the epigastrium and intense dyspnoea. After death an hydatid vesicle was found in a branch of the right pulmonary artery. A tumour of a like nature, as large as the head of a child occupied the position of the left lobe of the liver, and communicated with the pericardium, which was highly inflamed. The liver was pressed back by the tumour, which adhered to the diaphragm and abdominal walls. There were other hydatid tumours in the spleen, in the cellular tissue beneath the peritoneum, in the omentum, under the cæcum, in the mesorectum, in the mesentery, and in the free extremity of the vermiform appendix.—*Gaz. Hebd.*

FOREIGN CORRESPONDENCE.

FRANCE.

PARIS, NOVEMBER 7, 1859.

THE Ecole de Médecine and its precincts which usually wear so dull an aspect during the summer recess, are now beginning to resume their wonted appearance, and the entire neighbourhood seems, within the last few days, to have undergone a change. The Secretary's bureau is literally besieged with Students, inscribing themselves for the coming Session, and the examinations for degrees in medicine, which usually take place at this season of the year, are now in full operation. The *Ecole pratique* has, I observe, undergone some important and long-desired changes. The old pavilions, where the Students dissect, notorious for their filth and general inconvenience, have at length been cleaned out and reformed, and some of them made larger. The "stars" of the Profession are returning from their autumnal holidays, and in the course of a week the work of the Session will have seriously commenced. Through the kindness of M. Hardy, one of the Physicians of the Hôpital St. Louis, I had an opportunity of seeing, some weeks ago, what is not met with every day in this part of Europe,—a well-marked case of genuine Hebrew leprosy, or, as it is called by writers of the present day, "elephantiasis of the Greeks." The subject of it, a man, aged about forty, and a native of the Mauritius, is at this moment under treatment in one of the private pavilions attached to the St. Louis Hospital. The disease is confined to the face, but threatens to spread to other parts of the body. Altogether he presents a peculiarly repulsive aspect. The face generally is swollen, and the extremity of the nose, where the affection is in its most advanced stage, is a mass of rugged and unhealthy ulcers, which pour forth a sanious-looking discharge. On the cheeks are several tuberculous patches, considerably elevated and separated by fissures. These patches are irregular in form and size, and the skin covering them is in a state of comparative anæsthesia. The sensibility of the healthy tissues in their immediate vicinity is, however, slightly increased. Although M. Hardy, in common with the majority of writers on this disease, regards it as incurable, still, in the present case, the treatment, together with the hygiene to which the patient has been subjected since his admission, have to a certain extent had a salutary influence. His general health has benefited, and the local symptoms present a shade of improvement. M. Hardy does not consider the affection as contagious; in proof of which I may mention, that the patient occupies a bed in a small room where there is another individual suffering from a totally different disease.

In the male ward of M. Nonat, at La Charité, I saw lately a highly interesting case of aneurism of the arch of the aorta. The aneurismal sac formed a prominent tumour, visible at some distance, situated below the right clavicle. It was as large as a full-sized orange, its outer covering being formed of the parietes of the chest. The pressure of the sac had completely destroyed by absorption considerable portions of the two superior ribs. The pulsations of the tumour were very marked, and were synchronous with the heart's action. The subject of the disease is a locksmith, aged forty-two, and its origin is attributed by him to an unusual effort made while he was engaged in raising a very heavy weight some two years ago; since that accident, he has been from time to time affected with palpitation, giddiness, dyspnoea, and hæmoptysis. It is only nine months ago that the tumour has become visible externally. For the first part of this time it was quite globular in shape, but latterly it has become flatter, and seems now to be extending in the direction of the axilla. It is to be presumed that the aneurism must be of unusual size, as it is more than probable that all the soft and less resisting parts in its vicinity would be displaced, before it produced that amount of pressure on the bony parietes of the chest, necessary to the absorption of the ribs. The patient, for whom little could be done, was dismissed from the Hospital, after having been relieved of an attack of distressing dyspnoea and hæmoptysis, by bleeding, cupping, and the internal use of astringents.

It would appear that the Medical Staff of the French Army, during the recent campaign in Italy, while courageously discharging the duties more immediately belonging to them, had

not been inattentive to other matters bearing on the sanitary condition of the inhabitants of Lombardy. During their hurried march they had collected some thirty specimens of water, taken from the streams and rivers of the country, particularly in those districts where goitre prevails. These specimens they analysed with great care on their arrival at Milan, with the view of ascertaining what influence they might have in the production of that curious affection, the causes of which have been for many years the subject of much conjecture, and concerning which so much mystery still prevails. The conclusions arrived at, and which were communicated, in the first instance, by M. Demortain, the Pharmacien-en-chef of the Army, to Marechal Vaillant, who afterwards submitted them to the Académie des Sciences, are altogether at variance with the observations made some time ago by Bouchardat. The researches of Bouchardat show that the salts of magnesia are found in abundance in the soil of all districts where goitre is endemic, and to them he is disposed to assign an important part in the production of that disease. The analysis conducted by M. Demortain and his assistants, show, on the contrary a total absence of the salts of magnesia in the water collected in those districts of Lombardy where goitre, or wen, is most prevalent, as also the simultaneous absence of all muriates. In fact it was only on treating large quantities of these waters at a time with nitrate of silver and nitric acid that even a trace of a muriate could be detected. M. Gosselin, of the Hôpital Cochin, at the meeting of the Academy of Medicine on the 25th ult., read a very interesting and somewhat remarkable paper on the taxis, and especially its *forcible* and *prolonged* employment in the treatment of strangulated hernia. In this paper, after alluding to some eighty-five cases which had come under his care, thirty-five of which he had treated with considerable success by the forcible and prolonged use of the taxis, he entered into details of his mode of procedure. He commences his manœuvres by exercising on the hernial tumour gentle and moderate pressure, and if at the end of five or six minutes the reduction has not been accomplished, he increases the pressure by using both hands at the same time leaning over the patient so as to add to the pressure made by his two hands, a certain part of the weight of his body, and sometimes even causes the hands of a powerful assistant to be placed over his own. To this latter manœuvre he gives the name of "*taxis à quatre mains*." He continues this prodigious force steadily during twenty, thirty, forty, or fifty minutes, until the hernia is reduced or until the resistance is such as at the end of this time its reduction appears impossible. He regards as of little value all the preparatory means usually recommended by authors previously to the employment of the taxis, such as warm baths, lacking the use of tobacco, enemata, etc.; such measures he considers lead only to the loss of valuable time. He however, subjects all his patients to the anæsthetic influence of chloroform, not for the purpose of producing muscular relaxation, but to overcome their sufferings and so permit him to employ an amount of force which the cries and expressions of pain on the part of the patient might otherwise deter him from using. The conclusions arrived at by M. Gosselin, and which, I venture to say, will not be generally accepted as orthodox, are, 1st. That the forcible and prolonged use of the taxis is not so dangerous as Surgeons generally suppose, and that its utility is far greater than that usually attributed to it; and, further, that it may be had recourse to without any risk during the first seventy hours in crural and umbilical hernias. 2nd. That the treatment of strangulated hernia is essentially Surgical, and should consist in the immediate employment of the taxis when this is possible, or in an operation where prudence does not sanction the use of the taxis. Temporisation is, according to M. Gosselin, permissible only when the diagnosis is not complete, and where, for the purpose of clearing up the difficulty, it is necessary to have recourse to a purgative.

Although the opinion of M. Gosselin is, from his position and great experience as a Surgeon, entitled to very considerable respect, still I cannot help thinking that in the reduction of strangulated hernia it is an exceedingly difficult, or, I ought rather to say, an extremely thankless task to lay down any fixed rules, either in reference to the amount of force to be employed in the taxis, or as regards the length of time the manipulation should be continued. On these two points Surgeons will, and must, in each individual case judge for

themselves. Besides, by tact and ability, one man will often succeed with one-half the amount of force (and consequently with less risk of doing mischief), than that required by another, who goes about his work clumsily and awkwardly. I well remember having seen an illustration of the deplorable results of the prolonged and forcible use of the taxis in the service of M. Robert some twelve months ago. The operation was performed by that distinguished Surgeon almost immediately on the admission of the patient, when the mesentery was found so much lacerated, and the gut so much injured in consequence, that a large portion of the former, together with some three or four inches of the latter, required to be cut away. M. Robert at the time expressed his conviction that the entire mischief had been the result of the injudicious and forcible employment of the taxis.

GENERAL CORRESPONDENCE.

PROPOSED REMOVAL OF ST. THOMAS'S HOSPITAL.

LETTER FROM DR. STONE.

[To the Editor of the Medical Times and Gazette.]

SIR,—An article appears in your Journal for October 29, 1859, on the subject of the probable removal of St. Thomas's Hospital to a suburban site.

It is perhaps fortunate that a question which has for some time excited considerable interest, and has been the subject of conversational discussion, should be brought to a more precise consideration through the medium of the Medical press.

It is not my intention to enter into the general arguments on either side. But the position of Medical Registrar to the Hospital enables me to speak with accuracy on certain statistical facts which seem liable to misrepresentation, and in which undetected error may vitiate the results of all consequent reasoning.

The first of these fallacies lies in a single word. The town establishment of the Hospital, "for the immediate reception of sufferers from accidents and attacks of acute disease" is proposed as *small*. Now the result of the figures which I will give leads me to fear that such an establishment could not be made small, at least in proportion to the size of the whole Hospital. For on examining the statistics of the year 1858, I find that the total number of Medical cases discharged or dying was 1953. Of these 67 need to be subtracted as "not treated," "turned out," or "leaving of their own accord" on the day of admission. There remain 1886, which underwent treatment more or less protracted. Of these 578 were from the first acute and serious in character; while 275 more were in such a state as would not have justified removal beyond the Hospital walls. Without making any further deductions from removable cases, such as would certainly have occurred from the necessity of instant surgical aid and the like, we have 1033 cases which would probably have borne removal, against 853 which would certainly have sustained injury by the process.

On the Medical side alone, therefore, the acute and urgent cases amount to 82.5 per cent. of the chronic and removable. It follows, that during the year 1858, a year not marked by any special epidemic which, like the cholera, would tend to crowd the urgent wards, very little more than half the beds on the Medical side of the Hospital could have been removed to a distance without risk of injury to the patients admitted into them.

A second error seems latent in most of the usual comparisons between mortality in large town Hospitals and corresponding Institutions in more rural districts. That there is some real difference cannot be doubted, nor that it is in favour of the country situations. But statistical comparisons of death-rates greatly exaggerate it, for the following reasons:—

1. The patients admitted into the country Institutions are in a more healthy previous vital condition, independent of the specific disease for which they seek admission; whatever intrinsic difference exists between town and country dwellers, tells doubly under the drain of serious illness; the countryman comes in with a stock of surplus health, whereas the

townsman is weighted with the accumulated depression of a life-long struggling against innumerable causes of exhaustion.

2. But a more real cause of error lies in the fact that the death-rate of Hospitals differs in kind from the same estimate in the general statistics of a district, and requires other grounds of appreciation. For Hospitals are special and exceptional places, to which ordinary rules do not apply. Their doors are practically always open to the call of disease; and as in most places the supply of beds falls far below the number of qualified applicants, it becomes necessary to reject the less acute and dangerous cases in favour of those which are acute, critical, or even moribund. Thus it comes about, that wherever a Hospital is in the greatest demand, its occupants will be the most dangerously ill, and its death-rate the highest proportionally to its admissions. A Hospital death-rate is thus not a measure of the cures performed, or of its internal healthiness, so much as of the number and intensity of cases of serious disease in its district, and of the general anxiety among the lower classes to avail themselves of its benefits. It is physically what the House of Correction is morally—the “*sentina reipublicæ*,”—and in the present state of society, the more foul its contents, the more efficiently is it doing its duty.

Indeed, largeness of death-rate, so far from being a sign of defective administration, or of bad sanitary condition in a Hospital, on the medical side at least is of quite an opposite import. This is exemplified in St. Thomas's by what are called the Clinical Wards, to which are brought at all hours, cases marked by the greatest urgency, requiring the closest attention, and affording the best school of instruction for the pupils. The death-rate in these wards is high, although it is obvious that in them more critical points of practice occur, and more real cures are brought about than can be attained in wards full of chronic disease, where the death-rate is much lower. But a far stronger evidence is found in the examination of death-rates in specific diseases. For this purpose a few have been selected from the Report for the year 1858, which I have recently had the honour of presenting to the Hospital authorities, and in which every case has been verified by personal observation of the reporter, independent and corroborative of the diagnosis appended to the bed-ticket.

From this it appears that the death-rate of typhus fever was 18.1 per cent.; in typhoid, 20.0 per cent.; in delirium tremens, 17.3 per cent.; in pneumonia, 17.0 per cent.; in diarrhoea, 16.0 per cent.; in erysipelas, 7.0 per cent.; and in poisoning cases, accidental or suicidal, 17.6 per cent. All these death-rates are very high, indeed; yet no person of any experience can deny that these are, of all others, types of disease which benefit by the accurate diagnosis, bold medication, liberal dietary, abundant stimulants, and careful nursing of a Hospital. Probably the chief medical triumphs of the year will be found among the cited instances; undoubtedly more lives have really been saved among these patients than among any other equal number. And yet the death-rates are some of the very highest of any on the register.

This seems to complete the appeal from blind figures to discriminating intellect. Abstract death-rate is evidently no fair method of testing the sanitary condition of a Hospital, whatever be its value in estimating the healthiness of a district. And it is always to be regretted that fallacious reasoning should be put forward in defence of an object which actually stands on more solid grounds, and offers some real advantages.

I am, &c.

WILLIAM H. STONE, M.B.

Medical Registrar to St. Thomas's Hospital.

FAMILY DOCTORS.

LETTER FROM MR. W. OGLE.

[To the Editor of the Medical Times and Gazette.]

SIR,—Though you advocate a measure in your leading article of October 22, which embodies principles for which I have long contended, and though you have adopted the very form that I have myself chosen for giving expression to those principles (a), yet my first feeling on coming to the close of

your interesting essay is one of fear lest your words should be mistaken.

So much oftentimes depends upon a single word, and especially when that word is the keystone of the arch, that it is all-important to have a clear understanding from the commencement if any doubt is admissible as to its meaning. Without this precaution we may discover, when too late, that the boon—as we think it—which we have acquired is something very much the reverse of what we expected.

The boon you offer to the Profession is, that instead of giving advice gratis so indiscriminately at Hospitals, we should receive many of these patients on terms which are in accordance with their circumstances, and that we should stand to them in the relation of “Family Doctor.”

You take it for granted, that at present it is not considered to be quite consistent with the dignity of a Physician that he should be a “Family Doctor;” and you seem rather to imply that in obedience to necessity he should give way. Forgive me if I have misunderstood you; but this doctrine of expediency is so common and so perilous, that it cannot be too jealously guarded against, nor too often exposed as a mistaken and short-sighted policy.

Customs are always worth looking at, and into. They have generally—may I not say universally?—some truth, more or less, to rest upon; and it is worse than folly to disregard the voice of past experience. There must be some good reason for the dislike on the part of the public and of the Profession to the office of “Family Doctor.” It may be that we shall discover that, strictly speaking, it is not consistent with the dignity of any Professional man whatsoever to be a “Family Doctor,” according to the general acceptance of the term; but that if the term be properly defined, the office, so far from being disreputable, is more honourable even than any other.

Much depends upon the meaning assigned to the word “reputable.” What is it that makes a Professional act reputable or the reverse? Surely it does not altogether depend upon the amount of the commercial return—else every guinea is reputedly gained; and to give advice gratis is to be guilty of a base act. Some would have it so; but morality is not so easily gauged. We know, on the contrary, that a guinea may cover a very base transaction, and that the act that was done “for nothing” may be the only one at the close of a long day which will bear to be looked at. There must be some other standard than that of gold whereby we measure Professional respectability.

It is a matter of congratulation to see on every side that a different standard is adopted, and that with reference to the particular element of a return, the *mode* of payment, and not the amount, is the point which is always held to be of most importance in our Profession.

The College of Physicians recognises this in maintaining that the fee is “an honorarium,” and consistently with that view it declines to accept the right to sue for a fee. The public tacitly affirms the same by wrapping the fee in paper, and by the common feeling of awkwardness that a fee gives rise to. The anatomist discovers a “guinea muscle,” because he cannot otherwise understand how his own hand can ever take a fee. There is a good reason why it is, that to receive a fee is not an unmixed pleasure, and that the giver may be actuated by the highest regard of what is due to the Profession when he feels a reluctance to offer one. This is as it ought to be; it is something more than the over-sensitiveness of a young Doctor; and it is not necessarily the close-fistedness of a selfish patient. It is strict Professional propriety, and it is matter for regret, and not of congratulation, when a man has lost *all* dislike to the guinea fee.

These remarks are true of fees in general, however small. The practice of taking small fees, or, which is doing the same thing less openly, of paying from two to ten visits for one fee, is a miserable subterfuge, and is only worth mentioning as a further proof that the dislike to the fee is more general than is commonly supposed. There is, however, danger, when the absurdity of the guinea fee as a rule is once admitted, lest it should be thought advisable to try a smaller sum. This would be a public—I say not Professional, but a public—disaster. A guinea, or more, or nothing, must be strenuously maintained; and not only maintained, but acted upon. For to say one thing, and to do another, is to be a rogue.

A hundred voices cry “Impossible!” Starving Doctors, needy patients echo and re-echo this easy solution to a

(a) See abstract of paper read at Bradford on “Professional Remuneration,” given in the Medical News of the Medical Times and Gazette, Oct. 22.

difficulty; but clamour is not argument. The truth remains firm. Small fees do not go to the root of the matter. Small fees would lower the Profession; and, therefore, small fees would be disastrous to the public. It is the mode of payment, and not the amount, that requires modification.

The question therefore is, How can the public establish a claim upon a Professional man for Medical aid, if not by fee? There seems to be but one answer possible, namely, by making a periodical payment. Rather, I would say, a periodical agreement, for the idea of money should be kept in its subordinate position. Under ordinary circumstances a payment would of course be part of the agreement, but even then only part. Under exceptional, or extraordinary circumstances—as of charity, relationship, or other social tie—money would form no essential part, and may be altogether out of place. A periodical agreement, therefore, is the answer to the question; but, as in the case of a fee, it depends upon the terms of the agreement, whether it is reputable or not to make it. Though the amount paid be nil, yea, less than nil, the agreement may be perfectly honourable. On the other hand, it may be in the highest degree un-Professional, though the money payment is considerable.

It is because the terms that accompany a periodical payment are generally so un-Professional that this office of "Family Doctor" is deservedly in disrepute. It matters not whether he receives three shillings per annum as a club Doctor, or a hundred a-year as a family Physician, it is generally considered to be not quite the thing. It is winked at, and of course the more readily the larger the sum offered. The fact, however, is undeniable that club-practice is a by-word, and that the office even of family Physician must be very highly spiced before it is considered reputable.

Thus we are on the horns of a dilemma. The rule of fees, and advice gratis (the two are inseparable), is not all that can be desired; and a salary seems to be still more objectionable. The difficulty vanishes when the attention is confined to a consideration of the necessities of the case. In every provision for the many an attempt to promise more than is necessary, ends in failure to perform that which is enough. "Efficient Medical Aid" is the necessity in this case. We are for the present only concerned with that part of the Medical aid which the Professional man supplies—viz. advice. In order to give this efficiently, it is essential that he be in the relation of a friend to his patient. Unless the terms of agreement imply this relationship, the transaction is *ipso facto* unprofessional. Now, the family doctor, according to the ordinary terms of agreement, is a servant; he may be paid well, and even treated with confidence, and ultimately he may become the friend of the family—but it would be far better to begin right, and until the wages be converted into an honorarium, and the terms themselves imply consideration as well as confidence, the post of family doctor must remain, as now, the refuge of the necessitous, but not the position of honour.

The following terms embody the principles that have been laid down:—

First.—The Agreement should be prospective; the payment, if any, should be in advance.

Second.—It should establish a claim upon Professional service only if made before a certain hour in the day.

Third.—A summons after the hour named, or at any time specifically determined by the patient, should be by fee.

I am, &c.

WILLIAM OGLE.

9, Lower Belgrave-street, Nov. 2, 1859.

THE "FELL" TREATMENT OF CANCER.

LETTER FROM OSWALD FOSTER, ESQ.

[To the Editor of the Medical Times and Gazette.]

SIR,—In consequence of a remark that you would be happy to receive and arrange information relative to cases of cancer that had been subjected to the "Fell treatment," I beg to forward you the following brief outline of a case that was under the care of Dr. Fell, and reported by him, and believed by the patient and her friends (for a time) to be a successful one; but a short time served to dispel the delusion under which the poor lady and her relatives laboured.

Miss M. W., from Ireland, aged 56, discovered, in October, 1854, that she had a tumour in the left breast, for which she consulted the best Surgical authorities in Dublin, who pronounced it to be malignant. She came to London on a visit, in 1856, when she consulted Sir Benjamin Brodie, who confirmed the opinion already given, and discouraged any active measures being taken; at this time the skin had commenced to ulcerate, and she had enlarged glands in the axilla. "The great success" attending Dr. Fell's treatment of such cases did not fail to have its due influence upon the sufferer, and he was consulted by her in March or April, 1857, when every prospect of success was held out to her and her friends if she would only come and be under his treatment. She complied, and remained under Dr. Fell's care through April, May, and June, 1857; and both the poor patient and her friends have often alluded to the "torture" which she endured until the "cancer dropped out," after which the wound healed, or nearly so, the case was pronounced cured, and a report of the same no doubt placed an additional laurel in the temporary wreath of Dr. Fell's reputation. But this laurel soon withered, for in October of the same year, only four months after the cure, the part began to swell, the pain to increase, and by the end of the year glands above the clavicle had become enlarged, while those in the axilla had increased in size. In March, 1858, Dr. Fell renewed his treatment again, holding out a prospect of ultimate success, stating that they were enlarged tubercles, which he hoped soon to get rid of. She continued more or less under his care and treatment until early in the year 1859, by which time the disease had made such progress, that Dr. Fell seeing her constitution giving way from the misery, the great discharge, and repeated hæmorrhage, was compelled to acknowledge that he could do nothing more for her.

As soon as the weather permitted, and family arrangements could be made to receive her, she came to the house of a near relative in this neighbourhood, that she might spend the remainder of the days that she had to live in quiet, when my attention was called to her, and I do not know that I ever saw a more appalling wound or suffering case than hers, for the last two or three months of her existence. She died August 2, 1859.

I am, &c.

Hitchin, Nov. 4, 1859.

OSWALD FOSTER.

ACADEMY OF MEDICINE OF BRUSSELS.—M. Fallot, retiring after serving his three years as President of this body, M. Vleminkx, the Military Surgeon, has been chosen as his successor.

STATE OF THE PUBLIC HEALTH.—"104,339 persons died in the last quarter. This number is 6079 in excess of the deaths, 98,260, in the corresponding summer quarter of last year; and the rate of mortality, 2.093 per cent., is below the average (2.138); the excess in that average being due to the epidemics of cholera. A certain number of the deaths in the quarter may be set down as natural deaths, and they would not have exceeded 73,533 if the mortality in sixty-three districts of England, by no means in unexceptionable sanitary condition, be taken as the standard. The 30,806 deaths in excess of that number are unnatural deaths, the results of causes which it is the duty of every member of the community to endeavour to remove. It is a remarkable fact that the mortality of the quarter in the small towns and the country parishes was above their average to the extent of more than one death annually out of every 1000 living. A still greater excess might have been expected in the large town districts, whereas the reverse was observed; the mortality having been at the rate of 2 in 1000 less than the average. The summer mortality in the town districts was formerly to that of the rest of the country as 26 to 18; in the last quarter it was as 23 to 19; and the difference will undoubtedly be still less considerable when all the dense districts are supplied with pure water, and with the means of returning all their refuse to the fields as manure in an innoxious state. The deaths in London during the quarter exceeded the average. The high temperature facilitated the decomposition of the impure refuse under the houses, in the streets, and in the river. Diarrhœa was unusually fatal all over the London area; scarlatina and diphtheria were epidemic. In the surrounding divisions the mortality was also above the average, as there the same diseases prevailed, with variable degrees of severity."

REPORTS OF SOCIETIES.

OBSTETRICAL SOCIETY OF LONDON.

WEDNESDAY, NOVEMBER 2, 1859.

DR. RIGBY, PRESIDENT, IN THE CHAIR.

Twenty-eight gentlemen were elected into the Society, and the names of thirteen were read as Candidates for the Fellowship.

The following eminent obstetricians were proposed by the Council for election as Honorary Fellows, according to the bye-laws. They will be balloted for at the next meeting of the Society, in December—viz.: Fleetwood Churchill, M.D., Professor of Midwifery in King and Queen's College of Physicians, Dublin; James Matthews Duncan, M.D., M.A., Lecturer on Midwifery and Diseases of Women, Surgeons' Hall, Edinburgh; Alfred H. McClinton, M.D., Master of the Lying-in Hospital, Dublin; Archibald Hall, M.D., Professor of Midwifery, University of McGill College, Montreal, Canada; W. F. H. Montgomery, M.D., M.A., Late Professor of Midwifery, King and Queen's College, Ireland; James Y. Simpson, M.D., Professor of Midwifery, University of Edinburgh; Ed. C. I. von Siebold, M.D., Professor of Midwifery, Göttingen; F. W. Scanzoni, M.D., Professor of Midwifery, Wurzburg; Rudolph Virchow, M.D., Professor of Pathological Anatomy, University of Berlin; F. J. Moreau, M.D., Professor of Midwifery in the Faculty of Medicine, Paris; Paul Dubois, M.D., Professor of Clinical Midwifery in the Faculty of Medicine, Paris; Chas. D. Meigs, M.D., Professor of Obstetrics in the Jefferson Medical College, Philadelphia; and Walter Channing, M.D., Professor of Midwifery in the University of Cambridge, Boston, United States.

A paper by F. W. MACKENZIE, M.D. etc. was read, entitled

NOTES OF A CASE OF CRANIOTOMY

IN WHICH DELIVERY WAS READILY EFFECTED BY TURNING AFTER PERFORATION, WHEN INSTRUMENTAL EXTRACTION WAS FOUND IMPOSSIBLE.

In this case the conjugate diameter at the brim was only two inches and three-eighths. As the woman had arrived at the full term of gestation, it was thought necessary to perforate the cranium; but all subsequent attempts at extraction by the crotchet and craniotomy forceps failed. Turning was, however, easily performed, and the child brought away. The mother died, apparently from exhaustion, a few hours afterwards. The paper concluded with the suggestion that turning should be had recourse to in all cases of craniotomy similar to the one detailed.

Some discussion followed, in which Drs. Rigby, Barnes, Hall Davis, Rogers, Tyler Smith, and Waller, and Mr. I. B. Brown, took part. It appeared to be generally thought that the plan of treatment recommended by Dr. Mackenzie was that usually followed in the present day; while Dr. Tyler Smith considered that turning would probably have succeeded, had it been at first tried, without resorting to perforation.

A paper by Dr. R. BATTY was read on—

A NEW PRINCIPLE OF TREATMENT AND APPARATUS FOR VESICO-VAGINAL FISTULA.

The principle which the author proposes to introduce in the treatment of this affection is moderate pressure upon the approximated edges of the fistula, with the object of so condensing the tissue as to make a water-tight joint, through which it shall be impossible for the urine to flow. The apparatus is so constructed as to give a power over an obstinate fistula for its ready closure, not heretofore possessed by any of the appliances in use—a power also which may be usefully exerted for bringing down the uterus and vagina so as to render the fistula easily accessible. It is so constructed as to permit a full inspection of the edges of the fistula up to the last step of the operation, so that the operator may determine by the eye the exact co-aptation of the edges. The compress and splint are combined in a simple leaden bar, which has a row of perforations on one edge and notches on the other; by this arrangement enabling the operator to avail himself of the advantages above mentioned.

Mr. BAKER BROWN observed that the plan recommended by

Dr. Batty would only apply to the simple transverse lesion, running in a straight line, and therefore could not be considered an improvement on Bozeman's button, which applied to all forms of fistula. It is notorious that these lesions are frequently very tortuous, and in such the plan just exhibited by Dr. Batty would not answer. Mr. Brown had lately invented a simple and certain mode of securing the sutures by a small bar clamp, which he exhibited to the Society. He intended shortly to place details of his plan before the Profession.

A paper by Dr. ROBERT DUNN, F.R.C.S., etc., was read

ON THE STATISTICS OF MIDWIFERY, FROM THE RECORDS OF PRIVATE PRACTICE.

In this paper was comprised a summary of the author's midwifery records for twenty years. He began by expressing his conviction that the records of private practice might be usefully and advantageously contrasted with the statistics of Lying-in Hospitals and public institutions; and that while his own experience could only be brought to bear upon the working and middle classes of society, he hoped—seeing how important was the influence which the different modes and habits of life had upon the parturient process—that other Fellows of the Society would not be wanting to supply the desiderata in relation to the other grades and ranks of social life: not only to the highest, to those living in the lap of luxury, surrounded by the elegances and enjoying all the indulgences of life, but also to the lowest, to those sunk in the depths of indigence, ignorance, and penury, and often without even the ordinary comforts of life. The author considered that what had been said of statistics in relation to medicine in general, applied with peculiar force to obstetrics in particular; for what we wanted in midwifery "were facts comparable facts, numerous facts, well observed, carefully arranged, minutely classified, and acutely analysed." From 1831 to 1850, a period of twenty years, he had registered 4049 cases of midwifery as occurring in his practice. Of these, after deducting 228 for premature births, there were 2133 male, and 1688 female children. In regard to plurality of infants, there were 2 cases of triplets and 45 of twins. He had met with 3 cases of monstrosity, one of which was worthy of notice, and had been put upon record in *The Lancet* for April 27, 1844. It was that form of monstrosity which Dr. A. G. Otto has designated *Monstrum humanum serciforme*. He had met with one instance of the hydatidiform or vesicular mole, and several cases of cranial blood-swellings, 3 of hare-lip, 4 of cleft palate, 3 of spina bifida, and 5 of imperforate anus. In one of the last, Amussat's operation for artificial anus in the left lumbar region was attempted, but was not successful—the descending colon was found to be impervious and not larger than a crow-quill. There were 170 still-born children in all, from various causes, and in 30 cases death was attributable to the pressure of the cranial bones upon the brain in tedious and difficult labours. There were 60 instances of preternatural presentations. Of 11 cases, in which there was a prolapsus of the funis, 8 were born dead; and of these, in 3 instances the cord came down with the head, in 2 with the head and arm, in 1 with the foot, and in 2 with the shoulder. Of 25 breech presentations, 9 were still-born; and of these, 5 were putrid. There were three face presentations, 1 child dead; 11 cases face to pubes; 2 head and arm, both dead; 3 hand, and 3 footling cases. In the use of the forceps the author confessed to have had but slender experience. Impressed with the importance of the maxim, that "a meddlesome midwifery is a bad midwifery," he had always, in the absence of danger to the life of the mother, and when convinced, in his own mind, that the natural efforts would effect delivery, been content to wait, and had avoided instrumental interference. He had had ten cases of craniotomy; two proved fatal to the mothers—one from sloughing of the bladder, the other from a tumour at the neck of the womb. Once satisfied that the child was dead, he had never hesitated to have recourse, without delay, to craniotomy. The use of the stethoscope in such cases he considered of paramount importance. Of placenta prævia, six cases had occurred in his practice; three since the promulgation of Dr. Simpson's views and mode of treatment. He gave a brief narrative of two of these; one as having presented evidence to his own mind that the detached portion of the placenta, from its appearance and condition, had afforded the channel through which the blood had gushed; and the other as being

an instance of the instantaneous arrest of the hæmorrhage as soon as the placenta had been entirely and completely separated from the uterus. He had met with thirty cases of adherent placenta requiring the introduction of the hand into the uterus; and four instances of the hour-glass contraction. He had witnessed two fatal cases from sheer exhaustion after delivery, where the hæmorrhage before the birth of the child had been great; and one fatal case of internal flooding. Other fatal cases of exhaustion he referred to, which were unconnected with the loss of blood. One interesting and instructive case had come under his notice, in which, while the mother lay in a state of coma from an apoplectic seizure, and the phenomena of life were reduced to a mere series of automatic movements, a foetus of five or six months was expelled from the womb. Of twelve cases of puerperal fever which had occurred, three were acute, and terminated fatally. In one of these, the placenta had been found adherent, with hour-glass contraction of the uterus, and great hæmorrhage. In all, excepting where an hereditary tendency existed to mental disease, the loss of blood had been great. Of puerperal convulsions, he had met with four cases—none fatal; of phlegmasia dolens, six, and two proved fatal; of scarlatina, three, and one died.

Dr. BARNES made some brief observations—the hour for the separation of the meeting had arrived—on Mr. Dunn's treatment of his cases of placenta prævia, to which Dr. WALLER replied, as he had partly been responsible for their management.

Dr. TANNER remarked that the ruling law in Dr. Dunn's practice seemed to have been the old proverb, that "meddlesome midwifery is bad." Dr. Tanner considered that this rule was the cause of a great deal of mischief. In practice it was not only necessary to consider the life of the mother, but also to how great an extent we might beneficially mitigate her sufferings. A lingering labour could hardly be otherwise than injurious to both mother and child. Although his practice had been much smaller than Mr. Dunn's, yet during the last twelve years he had employed the forceps much more frequently than this gentleman, and had obtained only the happiest results from such a proceeding. He had never found the slightest mischief result from it either to offspring or parent.

Mr. BAKER BROWN said he was glad to hear the opinion just expressed by Dr. Tanner. In almost all the cases of vesico-vaginal fistula which had come under his care, this accident had happened from the long retention of the foetal head in the pelvis, giving rise to inflammation and sloughing. In reply to an observation from Dr. Graily Hewitt, that he had traced cases of vesico-vaginal fistula to the improper use of instruments, Mr. Brown stated that he had only known of one such instance.

WHAT IS SOCIAL SCIENCE?—"It includes the Constitution of Woman—Total Abstinence—Decimal Coinage—the Encouragement of Natural History—Ought Punishment to be Vindictive or Medicinal?—Sewage Irrigation—the Statistics of Consumption—the Government Grant—Diseased Teeth—the Registration of Deeds—Competitive Examinations—Chambers of Commerce—the Mortality in Towns—the Relations of Law and Equity—the Condition of Journeymen Bakers—the Financial Reform Association—the Law of False Pretences—the Purchase of Stale Food—Patent Right—the Education Grant. If Social Science is all this, there is nothing which it is not. Only let us understand what the Associates are driving at. If this is what we are to take Sociology for, it is only what all books, all Parliaments, all pulpits, all leading articles are. If Sociology is only a fine name under which everybody who has some other profession or calling may become an essayist, preacher, lawyer, divine, or moralist, then what it comes to is, that everybody at these gatherings is to have an opportunity of airing his pet crotchet or riding his favourite hobby in very good company. The really pleasant thing is, that nobody seems to care about contradicting his brother Reformer at the great annual palaver; nor is there any reason that he should. Utopia is a spacious realm; and, as Uncle Toby said to the fly, the world is wide enough. Cuckoo Cloud-Town presents ample space in which Sociologists may buzz about without interfering with each other's airy schemes of pantological philanthropy."—*Saturday Review*.

MEDICAL NEWS.

ROYAL COLLEGE OF SURGEONS.—The following gentlemen, having undergone the necessary Examinations for the Diploma, were admitted Members of the College at a meeting of the Court of Examiners on November 4:—

BAXTER, JOSEPH, Clitheroe, Lancashire
BLAKELY, SAMUEL, Aughnacloy, Tyrone
COUPER, JOHN, Finsbury-circus
CROFTS, WILLIAM CARRICK, Church Gresley, Ashby de-la-Zouch
PENISTON, JOHN, Bury, Lancashire
ST. JOHN, CHARLES, Foulis-terrace, Onslow-square

APOTHECARIES' HALL. — Names of gentlemen who passed their Examination in the Science and Practice of Medicine, and received Certificates to Practise, on Thursday, the 3rd November:—

BOOTH, SAMUEL, jun., Huddersfield
DANIEL, THOMAS PALMER, Beaminster, Dorset
HUGHES, ADOLPHUS JAMES, Dartford, Kent
RUCK, DAVID, Cirencester
WHITE, WILLIAM AGRAMAN, Frome, Somerset

The following gentlemen also on the same day passed their First Examination:—

DUKE, STEPHEN, Chichester
HOCKING, JOSEPH, St. Ives, Cornwall
WILLIAMS, JOHN, Brecon, South Wales

APPOINTMENTS.

To be Honorary Physicians to her Majesty.

BRYSON.—September 27, Alexander Bryson, M.D. F.R.S. Inspector-General of Hospitals and Fleets.

LIDDELL.—September 27, Sir John Liddell, C.B. M.D. F.R.S. Director-General of the Medical Department of the Navy.

NISBETT.—September 27, Alexander Nisbett, M.D. Inspector-General of Hospitals and Fleets.

WILSON.—September 27, John Wilson (b), M.D. F.R.S. Inspector-General of Hospitals and Fleets.

To be Honorary Surgeons to her Majesty.

DUNN.—September 27, Thomas Russell Dunn, M.D. Deputy-Inspector-General of Hospitals and Fleets.

EVANS.—September 27, Oliver Evans, M.D. Deputy-Inspector-General of Hospitals and Fleets.

JOHNSTON.—September 27, James Wingate Johnston, M.D. Deputy-Inspector-General of Hospitals and Fleets.

STEWART.—September 27, John Grant Stewart, M.D. Deputy-Inspector-General of Hospitals and Fleets.

DEATHS.

ABRAM.—November 4, at North End, Fulham, John Frederick Abram, late of Kensington, M.R.C.S. and L.S.A.

CHOLMELEY.—September 9, at Calcutta, after a very short illness, Assistant-Surgeon Henry Cholmeley, M.D., Madras Army, Staff-Surgeon and Medical Storekeeper at Rangoon, aged 33.

DARWIN.—November 6, at Breadsall Priory, near Derby, Sir Francis Sacheverel Darwin, Kt. M.D. aged 74.

EASTCOTT.—November 1, at No. 20, Stratford-place, Camden Town, of a rapid decline, Richard Duke Eastcott, L.S.A.

EVEREST.—On board the "Earl of Eglintoun," on the homeward passage from Hong Kong, Dr. James Everest, R.N., late of H.M.S. "Highflyer," aged 38.

GROSVENOR.—November 2, at Tunstall, Staffordshire, John Boden Grosvenor, L.R.C.S. Edin. aged 29.

HATCH.—October 26, perished in the wreck of the "Royal Charter," George E. F. Hatch, Esq., M.R.C.S., of Farnham Royal, Bucks, Surgeon-Superintendent in the Government Emigration Service.

LEATH.—October 21, at his residence, at Notting-hill, aged 83, J. G. Leath, Esq., M.D., late of the Army Medical Staff.

MANUEL.—November 4, at his residence, 5, Albion-square, Dalston, the Rev. William Manuel, D.D. aged 74.

SHAW.—November 8, at the residence of his Father at Dublin, Henry Shaw, M.D., aged 25.

WILLIAMS.—November 1, at Mold, John Williams, M.D., formerly of Corwen, aged 59.

WILLIAMS.—November 3, very suddenly, at Ulanberis, William Rumsey Williams, formerly of Carnarvon, M.R.C.S. Eng., 1824, aged 51.

WILLIAMSON.—November 5, at 17, Gloucester-place, Brighton, late of Cupar, Fife, William Williamson, Esq. M.D. L.R.C.S. Edin. aged 43.

THE PRINCE CONSORT has honoured Dr. Mayne by accepting the dedication of his elaborate work, the "Expository Lexicon."

THE Society of Arts once offered a prize for a cheap microscope; and we are informed that the house which obtained the prize has sold above 1500 of such microscopes.

FRENCH SCIENTIFIC CONGRESS.—The next Meeting of this body will take place at Cherbourg, on September 3, 1860.

LORD ELGIN AND MR. DISRAELI are pitted against each other as candidates for the Rectorship of Glasgow University.

SIR EMMERSON TENNENT tells of a wealthy native of Ceylon, who kept a *cobra di capello*, as we keep house-dogs, to guard his house and protect him from unpleasant visitors.

ST. ANDREW'S UNIVERSITY.—Professor Forbes, who at present fills the chair of Natural Philosophy at the University of Edinburgh, has been appointed Principal of the United College of St. Salvador and St. Leonard, in the University of St. Andrews.

THE ACTUAL CAUTERY IN CANCER.—M. Sédillot, of Strasbourg, strongly recommends the use of the actual cautery in the removing of epithelial cancers; removing as early as possible (under chloroform) the healthy parts immediately surrounding the cancer.

MADAME LIND GOLDSCHMIDT, on the 27th ult., paid a visit to the Mercers' Hospital, Dublin, for the benefit of which she had given her gratuitous professional services. The Governor presented her with an address of a very flattering kind signed by most of the leading people of Dublin, and by the Medical men of the Hospital.

PROFESSOR CRUVEILHIER'S PURGATIVE MIXTURE.—Narbonne honey, 30 grammes; syrup of buckthorn, 30 grammes; powdered senna leaves, 4 grammes; powdered jalap, 4 grammes; powdered scammony, 1 gramme; powdered squills, 40 centigrammes; powdered calomel, 40 centigrammes; powdered digitalis, 40 centigrammes. Divide the mixture into four parts, and take the four doses in eight days—one every other day. Used in albuminuria.—*Répertoire de Pharm.*

RATIONS OF MEAT IN THE EUROPEAN ARMIES.—M. Lunda, a Spanish journalist, states that the daily distribution of meat amounts to 375 grammes in the English army; 250 in the French and Belgian; 250 in the Russian (given only four times a-week); 192 in the Neapolitan (twice a-week); 170 in the Prussian; 156 in the Piedmontese; and 125 in the Austrian. In Spain, with the exception of a few regiments, no butchers'-meat is furnished, the soldiers receiving only from 33 to 38 grammes of bacon.

SIR D. BREWSTER IN OFFICE.—The Winter Session of the University of Edinburgh was opened on Tuesday afternoon by an address from the Principal, Sir David Brewster. The chemistry class-room and the lobby and stairs leading to it were crowded to excess long before the hour for the delivery of the address, and many were unable to gain admission, while a large number of those who effected an entrance could not hear the address in consequence of the noise and confusion caused by the overcrowding. Sir David Brewster was accompanied to the class-room by nearly all the members of the Senatus, and by Bailies Grieve and Johnston.

WARM BATH IN BURNS.—Dr. Passavent, of Frankfort, has had an opportunity of observing this treatment in all the different degrees of burns. In the wounds of thirteen cases a permanent warm bath was used wherever it was applicable; to the wounds of the head, etc., warm fomentations were constantly applied; the water was kept at thirty-two degrees Réaumur, and the bath continued until cicatrization took place. Pain soon ceased; the reaction was moderate; exfoliation of the dead parts gradually took place; the wounds remained clean; in no case did purulent absorption occur. Dr. Passavent adds that this application softened, and rendered more extensible the cicatrices.

EDINBURGH UNIVERSITY.—The election for the office of Rector will, it is expected, lie between Mr. Gladstone, M.P., and Lord Neaves, one of the judges of the Court of Session, the other names mentioned having been withdrawn. The election will take place this day. The constituency, it is expected, will number from 1,200 to 1,400. It is to be hoped that the Students who have seen the Town Council elect such a Principal as Brewster, and the University Council such a Chancellor as Brougham, will not elect as Rector an unknown Lord of Session when a Gladstone is in the field. On Saturday last the Senatus Academicus unanimously made choice of Professor Christison to represent them in the University Court.

CAUSE OF THE RÂLE CREPITANT.—Professor Wintrich and Dr. Carr object to the explanation of this râle, as given by MM. Barth and Roger—viz.: "That it results from the passage of air through liquids contained in the pulmonary vesicles." They then give what they consider a *new* explanation of the fact, but one which we venture to think is pretty generally accepted at the present moment by Physicians:—"The mucous membrane of the vesicles and last ramifications of the bronchi is swollen and covered with a viscous mucus. During expiration, their walls come into contact and are stuck together; but during inspiration, on the contrary, the current of air dilates the tubes and vesicles, separates their walls thus stuck together, and so occasions a dry sound, which is, in fact, the *râle crépitant*." As we have said, surely there is nothing new in this explanation.

BROMIDE OF POTASSIUM.—The Fellows of the Medico-Chirurgical Society of London will recollect the alleged uses of bromide of potassium, as pointed out by their late President in reference to certain affections of the nervous system. Dr. Pfeiffer, of Paris, has lately experimented with the compound on the male sex. M. Thielman, in 1854, obtained good results, as he asserts, from its use in painful erections, satyriasis, and spermatorrhœa; and his results are now confirmed by Dr. Pfeiffer. He finds that it exercises a happy influence over seminal losses, abnormal erections, and neuralgia of the neck of the bladder. It has a special power over the muscular part of the genito-urinary apparatus, and at the same time causes a marked amelioration in the secreting action of the same organs. In large doses it appears to produce symptoms like those caused by iodide of potassium.

UNIVERSITY COLLEGE, LONDON.—The Council held their first session of the academical year 1859-60, on Saturday last. Requests to the Hospital were reported—viz., by Richard Joseph Reed, late of Middle Temple-lane, gentleman, 100*l.*; by Mrs. Hannah Bull, of Earl-court, Old Brompton, widow, 100*l.*; by Mrs. Mary Ann Worley, of Stoney Stratford, 1,000*l.*; by Mr. Sigismund Stiebel, late of Gordon-square, 200*l.*, free of duty. The Longridge Prize of 40*l.* for general proficiency in medicine and surgery, by the recommendation of the Faculty of Medicine, was conferred on Mr. Thomas Charles Kirby. The award by three physicians of the Hospitals—Professor Parkes, M.D., Professor Walshe, M.D., and Professor Garrod, M.D.—of Dr. Fellowes's Clinical gold medals, for the best observations on cases in the Hospital, to Mr. Thomas Charles Kirby and Mr. Augustus Mawley, equal in merit, was reported.

PNEUMONIA, BLEEDING, AND DELIRIUM.—A man, 53 years old, vigorous, but given to drink, was seized with acute pneumonia on the 14th, and falls into the hands of M. Degranges on the 16th, who bled him at once, and then gave oxide of antimony and morphia, then emetic tartar, and twenty-two leeches were also applied to the part in pain. Hereafter the breathing was slightly relieved; but on the 19th signs of delirium showed themselves, and the patient became very violent, calling out incessantly in the most vehement manner for food. M. Degranges, after duly weighing all circumstances of the case, took the happy determination of satisfying his desire. He ordered coffee and bread and a mutton chop, and some wine. Hereupon the delirium ceased, and the patient lay quietly down in bed and gradually recovered. [We are not told whether or no our French brother considered that the delirium was the consequence of the loss of blood. In this country we should say, that it undoubtedly was. Nor should we have required any deep weighing of the case, in order to have arrived at the conclusion that nutriment was necessary.]

THE INDUCTION OF PREMATURE LABOUR AUTHORISED AT ROME.—Professor Finizio, of the Obstetric Clinic of Naples, having received into the Maternity a rickety, deformed girl, about seven months gone with child, in whom the internal pelvimeter only indicated an antero-posterior diameter of three inches at the inlet of the pelvis, and a coccyx-pubic diameter of two inches, induced premature labour by means of uterine douches. The operation was quite successful both for mother and child; but the case having made much noise in Naples and formed the subject of the most injurious commentaries in the papers, Professor Finizio laid the circumstances before the metropolitan archbishop, who referred the case to the Sacred Penitentiary at

Rome. The following was the decision of the sacred Body: "*Si intelligatur partus immaturi qui prævenit ordinarium naturæ cursum, ita tamen ut fœtus eam maturitatem absecutus fuerit, ut in lucem editus vivere possit, affirmative. Cardinal Castracano.*" This decision, it will be seen, only applies to a child having attained the age of viability. The really thorny question of abortion is, therefore, reserved, or rather, if would appear from the care taken to separate it, resolved negatively.

LIST OF OFFICE-BEARERS OF THE ROYAL COLLEGE OF SURGEONS OF EDINBURGH, OCTOBER, 1859.—President—D. MacLagan, M.D. Treasurer—J. Gairdner, M.D. Secretary—J. Scott, W.S. President's Council—J. S. Combe, M.D.; J. Simson, M.D.; Andrew Wood, M.D.; Robert Omond, M.D.; Patrick S. K. Newbigging, M.D.; John Struthers, M.D. Librarian—Archibald Inglis, M.D. Library Committee—Archibald Inglis, M.D., Convener; Richard Huie, M.D.; Patrick S. K. Newbigging, M.D.; James Robertson, M.D.; William Husband, M.D. Curators of Museum—Professor Syme, and Professor Miller (*ex officio*); John Struthers, M.D. (*ordinary*); James D. Gillespie, M.D.; Joseph Lister; Patrick H. Watson, M.D.; Henry D. Littlejohn, M.D.; Alexander Mackenzie Edwards; Thomas Williamson, M.D.; David Wilson, M.D.; William Walker; Robert E. S. Jackson, M.D. Examiners—John Gairdner, M.D.; James Simson, M.D.; Richard Huie, M.D.; William Dumbreck, M.D. Archibald Inglis, M.D.; Andrew Wood, M.D.; Robert Omond, M.D.; Patrick S. K. Newbigging, M.D.; Benjamin Bell; James Dunsmore, M.D.; John Struthers, M.D.; James Spence. Inspector of Students, Course of Study—James Simson, M.D. Assessors to Examiners—David MacLagan, M.D.; James S. Combe, M.D.; James Syme; Samuel A. Pagan, M.D. Conservator of Museum—William R. Sanders, M.D. Officer—John Dickie.

SANITARY CONDITION OF ENGLAND.—The last quarterly return of the Registrar-General presents a favourable view of the state of the country. "The marriages increased as they do when the prospect of life among the working classes is cheering. Thousands of children in excess of the average were born; and the rate of mortality diminished; and the population increased at an unusual rate. As the diminution in the rate of mortality took place in the towns it may be fairly ascribed to the prosperous state of trade, to the supply of better water, the abolition of cesspools, the purification of the air, and the various sanitary works which many of them have carried out. 63,972 was the excess of the number of births over the number of deaths, and that was therefore the natural increase of the population of England and Wales in 92 days. On an average 695 were added to the population daily, and the probable daily increase of the population of the United Kingdom was 1042, which at the ordinary rates of mortality will supply 347 men daily at the age of twenty. The youth of the country are growing at such a rate as to add a battalion to its strength every two or three days. A certain number of them are transplanted, and go to people the colonies. 34,864 emigrants sailed during the quarter, or 379 men, women and children on an average daily, from the ports of the United Kingdom at which there are Government agents; of whom about 12,464 were of English origin. The mean temperature of the quarter was 62°·8, or 3°·3 above the average temperature of the season during eighty-eight years. The excessive heat was accumulated chiefly in July, when the mean temperature was 68°·1; while on July 12, the air in the shade reached 92½°, and 93° on the 13th and the 18th; so that during ten successive days the mean temperature of day and night exceeded 70°, a thing unprecedented during the period over which correct observations extended. The air was drier (·72) than usual; but the rain-fall (8·2 inches) somewhat exceeded the quarterly average. The thermometer on the grass never fell below 40° in July and August, whereas it usually falls several times to the freezing point of water. Pauperism is below the average in the kingdom. The average number of paupers in receipt of relief during the quarter was 783,449, or less by about 29,000 than the numbers receiving relief in the corresponding quarters of the two previous years."

THE LATE DR. MALCOM, OF PERTH.—Death has just removed one of the best known and most highly respected citizens of Perth. Dr. Malcom, whose age was about seventy, became a licentiate of the Royal College of Surgeons of Edin-

burgh in 1808, and a graduate of St. Andrews in 1813. He was also a member of the Royal Medical Society of Edinburgh. Soon after taking his diploma as L.R.C.S. Edinburgh, he entered the service of the East India Company, and became Assistant-Surgeon in the Bengal Army. He was twice made a prisoner by the French; and after being two years in India, he returned home with a system somewhat shattered by the climate. He soon after retired from the East India Company's service on half-pay. Dr. Malcom settled as a Medical Practitioner in Perth about the year 1813; and after a few years, attained to high distinction in his Profession, being especially acceptable to the nobility and gentry in the city and county, while at the same time, he gathered "golden opinions from all sorts of people." For very many years he has held several public offices of high trust and responsibility. He was promoted to the office of Physician to Murray's Royal Asylum and Surgeon to the General Prison for Scotland at the opening of these Institutions; and in his later years he was consulting Physician to both. In these official situations it is well known to the authorities that he fulfilled his professional duties with zeal and singular ability. As a Professional man, he was much valued by his brethren, being always ready to oblige and lend his aid and advice.

A MEDICAL VIEW OF YORKSHIRE.—In one of those eloquent passages with which the Registrar-General—or Dr. Farr, in the name of this officer—concludes so frequently his statistical quarterly return, and enforces the lessons taught by figures, we find the following admirable picture of Yorkshire:—"Yorkshire, lying between the Humber and the Tees, lofty moorlands and the German Ocean, is now occupied by nearly 2,000,000 of people, living much in aggregated masses, but with families characteristically distributed in 400,000 separate dwellings. The varieties of the geological strata—the coal and iron of the earth—the plains and hills, feeding flocks of sheep, and horses—the rapid hill streams, and the smooth waters, easily made navigable far into the interior from the Humber—the position between Lancashire and Germany—between Ireland and the North of Europe—enabled a hardy, intelligent race of men not only to obtain all the ordinary products of the English soil, but to found the chief manufactories of woollen goods in the world. The men of the West Riding became the clothiers of mankind. And so intent were they on their work, that the health of the workpeople was sacrificed, and the race in a few generations must have degenerated. But a reaction set in; Lord Shaftesbury's Bill, limiting the hours of children's labour, was first agitated at Bradford, and promoted actively by some of the heads of the leading firms. The first temperance society, it is said, was formed in this centre. As substitutes for insalubrious processes, exquisite pieces of mechanism not only card but comb the wool, spin it, weave it, dye it, and finally convert the fleeces of England, with the fleeces of Germany, and the finer wools of Australia, either alone or combined with cotton, silk, and alpaca, into the finest textures, which vie in beauty and utility with the furs of animals or the gayer plumage of birds. The workpeople are now in average town health; and, through the incessant noises of machinery are often heard as the day declines pleasant voices singing the concerted songs of the Bradford minstrels. The mortality of Yorkshire during the ten years 1841—50 was at the rate of 23 in 1000; so 6 in 1000 died in excess of the deaths out of the same numbers living in comparatively healthy districts; and the unnatural deaths in the ten years amounted to 101,195. The loss of life in Yorkshire was unequally distributed; in the North Riding the mortality was at the rate of 19, in the East Riding (with York) 24, and in the West Riding 23 in 1000. The climate of Yorkshire is not naturally unhealthy; in the Guisbrough District the mortality was at the low rate of 16 in 1000, in Easingwold it was 17, in eight districts it was 18. Upon the other hand the mortality in the Hull District was at the rate of 31 in 1000; Sculcoates, 25; Leeds District, 30; Hunslet (including parts of the borough of Leeds), 25; Bradford, 25 in 1000. As Yorkshire chimneys do not yet consume their own smoke, it covers whole districts, and is necessarily consumed by the people, its producers say, with medicinal effect, which may, however, well be questioned. If we suppose, for a moment, all the causes of mortality suddenly to become visible like smoke over Yorkshire, then the disease particles will be seen to hang densely over Hull, Sheffield, Leeds, York, and their environs, less densely over the

Southern Districts and the East Districts of the coast, clearing as you ascend the rivers to their sources in the moors, and almost disappearing over Easingwold, and the Guisbrough District by the side of the sea and the waters of the Tees. Bradford has commenced various works which have already reduced the mortality. In the fourteen years 1841—54, the people of the Bradford District died at the rate of 26 in 1000 annually; while the mortality during the three years 1855—57 has been nearly at the rate of 21 in 1000. Mr. Hudson, the town clerk, has shown at the meeting of the National Association, that a part of this satisfactory result is fairly referable to sanitary measures. The full water supply, and the rapid removal of the entire refuse of the town to the surrounding land, are still on hand; and when these salutary measures are achieved, and others that an intelligent Medical Health Officer will suggest, Bradford will realise benefits which all the county will desire to share. The race of Yorkshire men, instead of degenerating, will then every year grow finer, more vigorous, more intelligent, better."

VITAL STATISTICS OF LONDON.

Week ending Saturday, November 5, 1859.

BIRTHS.

Births of Boys, 980; Girls, 908; Total, 1888.
Average of 10 corresponding weeks, 1849—58, 1569.5.

DEATHS.

	Males.	Females.	Total.
Deaths during the week	595	587	1182
Average of the ten years 1849-58	524.4	513.5	1037.9
Average corrected to increased population	1141
Deaths of people above 90
Deaths in 15 General Hospitals	47	18	65

DEATHS IN SUB-DISTRICTS FROM EPIDEMICS.

	Popula- tion, 1851.	Small pox.	Mea- sles.	Scar- latina.	Diph- theria.	Whoop- ing- Cough.	Dia- rrhoea.	Ty- phus.

METEOROLOGY.

From Observations at the Greenwich Observatory.

Mean height of barometer	29.218 in.
Mean temperature	47.6
Highest point of thermometer	58.0
Lowest point of thermometer	34.8
Mean dew-point temperature	43.1
General direction of wind	S.W.
Whole amount of rain in the week	0.97
Amount of horizontal movement of air in the week	2607 miles.

TO CORRESPONDENTS.

We are obliged, by an accidental circumstance, to defer replies to several Correspondents until next week.

Emeritus has not sent his real name.

Dr. Henderson's case of Moveable Kidney shall appear.

Dr. Ladd.—The report only arrived on Thursday, too late to be of use.

Mr. Long.—If friends on the spot cannot settle the dispute, we do not see that any good could be done by submitting it to the Profession in our columns. So far as we can judge of the case by Mr. Long's account, the remarks of the Coroner upon Mr. Salmon's conduct were quite just.

Graph.—Syphilis ends much more frequently in death than is generally supposed, if we are to credit M. Bazin. And this termination of it is brought about especially by syphilitic affections of the brain and spinal marrow, whose nature is entirely unknown. In his opinion, these affections are very common, and he calls the earnest attention of observers to them.

Scabies.—Chloroform aspersions have been found by Professor Bock a useful remedy for itch. The chloroform destroys the insect, and diminishes the irritability of the skin. Its use is not followed by any unpleasant consequences. The sensation of burning, momentarily produced by the chloroform, is nothing—according to the patients—in comparison with the insupportable itching caused by the disease.

Mr. Chavasse has sent us a reply to Dr. Barker's letter to the Medical men of Birmingham. The following extract ought to close this discussion. Mr. Chavasse says:—"I hereby declare that I never once wrote to Mrs. Barker, nor did Mrs. Barker ever write to me; that I never gave directions to my solicitors to write to Mrs. Barker; that I was not aware that my solicitors had written to Mrs. Barker, until I received a copy of a letter from them to that effect; that I regretted at the time, and regret still, that they had taken such a step."

ERRATUM.—No. 488, third line from foot of p. 466, for "volunt" read "lunult."

A KNOTTY POINT.

TO THE EDITOR OF THE MEDICAL TIMES AND GAZETTE.

Sir,—Can you give me an opinion as to how the New Medical Act applies to such a case as the following:—A quack Doctor has for some years pursued his calling, placing after his name the initials M.D., in virtue of some purchased foreign diploma. He applies to be registered and is refused on the ground of his not having been examined for his diploma, and for his quack practices. Can he now legally continue to advertise himself on his bills and bottles as M.D., by adding thereto the clause "Not Registered under the New Medical Act?" Can he claim the title of "Doctor" before his name, as on the address of letters? This is not a hypothetical case, but I know an actual instance where an irregular Practitioner, as above described, claims to have letters simply addressed "Dr." followed by his surname and name of the town, and transmitted through the Post-office, and forwarded to his house, when there. At the same time, resides in the same town a regular Practitioner of the same surname who is a registered M.D.—on the ground that the latter is the junior of the former in point of residence in the town. The Postmaster-General has been already applied to on the matter, and has replied that the case comes under a rule which provides that where two or more individuals of the same name reside in one town, and when letters are not distinguishable as for which intended, the Postmaster of the town shall transmit the said letters to the London office, there to be opened and sent back to their writers. The local Postmaster, however, asserts that he has discretionary powers; and in the present instance his discretion evidently leans to forwarding undistinguishable letters to the quack—the style of reasoning being, that as the quack gets by far the greater number of letters, the chances are on the side of any equivocally-addressed letter being for him. This plan, of course, saves the Postmaster trouble, but frequently inflicts injustice and annoyance on the legal Practitioner.

November 9.

I am, &c.

CIVITAS.

COMMUNICATIONS have been received from:—

Sir JAMES CLARK; Professor SIMPSON; Dr. WEST; Dr. ROBERT LEE; Dr. PEACOCK; Mr. WALTON; Mr. LAURENCE; REGISTRAR-GENERAL; Dr. R. D. THOMSON; Mr. LONG; Dr. LADD; Dr. JOHNSON; Mr. LONGDON; Mr. CHAVASSE, &c., &c.

APPOINTMENTS FOR THE WEEK.

November 12. Saturday (this day).

Operations at St. Bartholomew's, 1½ p.m.; St. Thomas's, 1 p.m. King's, 2 p.m.; Charing-Cross, 1 p.m.

14. Monday.

Operations at the Royal Free Hospital, 1 p.m.; Metropolitan Free Hospital, 2 p.m.

MEDICAL SOCIETY OF LONDON, 8½ p.m. Dr. Habershon "On Pain as a Symptom of Disease of the Stomach."

15. Tuesday.

Operations at Guy's, 1 p.m.; Westminster, 2 p.m.

PATHOLOGICAL SOCIETY, 8 p.m.

16. Wednesday.

Operations at University College Hospital, 2 p.m.; St. Mary's, 1 p.m. Orthopaedic Hospital, 2 p.m.; Middlesex, 1 p.m.

HUNTERIAN SOCIETY, 8 p.m. Mr. Solly "On Aneurism of the Arch of the Aorta."

17. Thursday.

Operations at St. George's, 1 p.m.; Central London Ophthalmic, 1 p.m.; London, 1½ p.m.; Great Northern, 2½ p.m.

HARVEIAN SOCIETY OF LONDON, 8 p.m.

18. Friday.

Operations, Westminster Ophthalmic, 1½ p.m.

WESTERN MEDICAL AND SURGICAL SOCIETY OF LONDON, 8 p.m. Practical Evening for the Narration of Cases and Exhibition of Specimens.

EXPECTED OPERATIONS.

King's College Hospital.—The following Operations will be performed this day (Saturday):—

Mr. Ferguson: Fistula in Ano; for Prolapsus Ani. Mr. Bowman: for Varicose Veins.

And on Monday, Nov. 14, 1859, by Mr. Partridge: Stricture of Urethra; Examination of Stump after Amputation.

FACULTY OF PHYSICIANS AND SURGEONS OF GLASGOW.

The following Gentlemen have been admitted Fellows and Licentiates of

FACULTY BETWEEN THE 1st OCTOBER, 1858, AND 1st OCTOBER, 1859.

FELLOWS.

James M'Ghie, M.D., Glasgow
James Stewart, M.D., Glasgow
Thomas M'Call Anderson, M.D., Glasgow
William Leishman, M.D., Glasgow
William B. M'Kinlay, M.D., Paisley
George H. B. M'Leod, M.D., Glasgow
Peter Stewart, M.D., Glasgow
George Henry Achison, Gilford, Co. Down, Ireland
John Robertson, Airdrie
David Taylor, M.D., Paisley
William J. Williams, Prescott, Lancashire

LICENTIATES.

John M'Quat, Glasgow
Edward Downing, Deptford
Peter Thornton, Dewsbury
Joseph Ruscombe Lansdown, Bristol
Robert Matthew Inman, London
William Furdon Blakeney, Birkenhead, Cheshire
Charles Oscar Murphy, Manchester
Ralph Heathcote, Waltham
Charles F. R. Gill, Whittington
Francis Smith, London
Edwin Reynolds Chick, Manchester
Herbert Smith Renshaw, Manchester
Malcolm Macfee, Greenock
Richard Perry Williams, Wrexham
Thomas Lyster Mathews, M.D., Omagh
Garret Barry, M.D., Southampton
James Stewart, jun., Glasgow
Andrew M'Leitchie, Glasgow
Charles Atkinson, Dublin
Joseph Denbigh Sainier, Macclesfield
Robert Clements, Glasgow

Alexander Forbes Thomson, Easdale
Donald M'Gillivray Davidson, Glasgow
Robert Rogerson, Lockerbie
Roderick Hope Bain, Lockerbie
Samuel Howard Cheetham, Stockport

The following Gentlemen have passed their First Professional Examination during the same period:—

Allan Gilmour, Glasgow
Hugh Brownlie Craig, Strathearn
James Hair, Port-Glasgow
Charles George Ritchie, Glasgow
James Smeal, Glasgow
Robert Bryce Gilland, Stewarton
James Cowan Woodburn, Edinburgh
John Aitken, Govan
John Copleston Baker, Sidmouth
George Robertson, Glasgow
William Marshall, St. Thomas
Joseph Conway, Greenock
John Sibley Hicks, Rothsay
John Wilson, Tollcross
William Wotherspoon, Hamilton
William Whitelaw, Kirkintloch
William Sloan, Glasgow
Alexander M. Scott, Glasgow

Extracted from the Minutes of Faculty,
R. D. TANNAHILL, M.D., Registrar.

Scammony Manufactured from the

ROOT.—This Pure Resin may be had of all Wholesale Druggists at 25 per cent. under the price of the best Virgin Scammony. And the superiority of its quality was fully explained at a meeting of the Pharmaceutical Society, and reported at length in their Journal of March last, from which the following are extracts:—

"From these numerous observations, one hundred and twenty in number, together with many others which have not been tabulated, I am quite convinced that the scammony prepared by the new process from the untapped root is quite equal, as a remedy, to the very best virgin scammony which is met with in commerce, and equal, in fact, to the resin which is extracted from commercial scammony by means of ether; and it possesses this most important advantage over the scammony of commerce, namely, of being entirely free from the frauds which are almost constantly practised upon it in the country where the plant grows, and in which it has hitherto been collected, and, therefore, being perfectly uniform in its physical characters, composition and therapeutic action. There can, therefore, be no objection, but, on the other hand, manifest advantage, in employing it in place of the scammony commonly met with.

"A. B. GARROD, M.D., F.R.S., F.R.C.P.

"Professor of Materia Medica, Therapeutics and Clinical Medicine at University College; Physician to University College Hospital."

"I have endeavoured to ascertain the relative activity of Messrs. M'Andrew's scammony, and of a fine specimen of commercial virgin scammony, by prescribing these drugs alternately in equal doses to the same patient. The results, according to the judgment of myself and others who have assisted me in watching the cases, is that in most instances Messrs. M'Andrew's scammony has proved itself decidedly more active than the virgin scammony. As to pleasantness of operation, or the reverse, there seemed to be no choice between the two specimens.

"That a preparation of scammony should be a little more or a little less active is of comparatively small importance. It is far more important that the drug should have a fixed and uniform composition and activity, so that the prescriber may know, with an approach to certainty, what doses are required to produce a given effect. This advantage of uniform activity Messrs. M'Andrew's Scammony seems likely to possess over the scammony which has hitherto been in common use, and which is a drug notoriously of most uncertain composition and power.

"GEORGE JOHNSON, M.D., F.R.C.P.

"Professor of Materia Medica and Therapeutics in King's College; Physician to King's College Hospital."

Health, Fresh Air, and Pure Water.

—By Her Majesty's Letters Patent.—CONDY'S FLUID contains NASCENT OXYGEN, *nature's true and only purifying agent*, instantly removes all offensive smells; renders impure water fresh, and the air pure; when diluted for use, is of a beautiful colour, not soiling the finest linen; is harmless, and particularly adapted for toilet use, being both refreshing and exhilarating. The Medical Profession have expressed their unqualified approbation of its merits. One gallon makes 200 gallons adapted for use. The cooling, healing, gently stimulating and invigorating properties of this Fluid render it, when diluted, a lotion possessing peculiar and valuable characteristics, whether for bathing the bodies of invalids, incorporating in poultices, or washing and healing wounds. Patronised by the Board of Health, and most public departments, hospitals, schools, and adopted by the India Council in preference to all other disinfectants. In bottles, 6d. 1s. and 2s.; stronger and purer, 1s. 2s. and 4s.

CONDY'S PATENT HEALTH POWDER also contains NASCENT OXYGEN, is odourless, and destroys all smells; in bottles, 1s. 6d. and 3s., and in casks of 1 cwt. 36s.—Wholesale agents, John Bell and Co. chemists, No. 338, Oxford-st. W.; Butler and Crisp, 5, Cheapside, St. Paul's; Ferris and Co., Bristol.—Chemical Works, Battersea, S.W.

"PULVIS JACOBI VER., NEWBERRY'S."

Diphtheria, Fevers, Hooping Cough,

&c.—We beg to caution the Profession against imitations of this invaluable Medicine, for so many years prescribed as "Pulvis Jacobi Ver." but to which it is now necessary to add the name "NEWBERRY'S," to secure prescribers against the substitution of articles advertised as James' Powder, BUT WHICH HAVE NOTHING IN CHARACTER, DOSE, OR EFFECT, with the original article, which has been sold by the Newbery Family continuously since its introduction in 1746.

Price, for dispensing: 1 oz. bottles, 9s.; ½ oz. do. 3s. 4d.

45, St. Paul's-churchyard, London. (Signed) F. NEWBERRY & SON.

Wines from the Cape of Good Hope.

W. and A. GILBEY'S SOUTH AFRICAN PORT, SHERRY, &c. &c., 20s. per Dozen. First growths only. Two samples for 12 stamps. Wine Importers and Distillers, 357, Oxford-street, London (W.); 31, Upper Sackville-street, Dublin; and 12, St. Andrew-square, Edinburgh. Medical Reports, Price Lists, &c. sent post free.

Pepsine.—M. Boudault begs to state

that he cannot be answerable for the purity and strength of any Preparation sold under his name unless obtained from his sole Agent, Mr. PETER SQUIRE, Her Majesty's Chemist, 277, Oxford-street, London, to whom all applications respecting it must be addressed.

Second Edition of Boudault on "Pepsine," with Remarks by English Physicians. Edited by W. S. SQUIRE, Ph. D., published by J. Churchill, London, may be also had of the Author, 277, Oxford-street, price Sixpence.

Great Reduction in the Prices of New

MEDICAL GLASS BOTTLES and PHIALS, at the Islington Glass Bottle Works, Islington-place, Park-road. London Warehouses, 19, Bread-street-hill, near Thames-street, City, E.C., and 2, Upper Copenhagen-street, Barnsbury-road, Islington. E. and H. HARRIS and CO. Proprietors.

6 & 8 oz., any shape, plain or graduated	do.	clear	{ 8s. per gross.
3 & 4 oz., do.	do.	blue tinted	{ 7s. 6d. do.
1 oz. white moulded phials	do.	of a very	{ 4s. 6d. do.
1 oz. do.	do.	superior	{ 5s. 6d. do.
1 1/2 oz. do.	do.	quality.	{ 6s. do.
2 oz. do.	do.		{ 7s. do.

Immediate attention to country orders. No remittance required until the goods are received. Packages free. Goods delivered free within 7 miles. Post-office orders made payable to E. and H. HARRIS and Co., at the Chief Office, London. Bankers: Union Bank of London.

N.B.—Orders sent to either Establishment will have prompt attention.

Varicose Veins and Supporting Bands.

—SURGICAL ELASTIC STOCKINGS AND KNEE CAPS, pervious, light in texture, and inexpensive, yielding an efficient and unvarying support, without the trouble of lacing. Likewise, a strong low-priced article for Hospitals and the Working-Classes. ABDOMINAL SUPPORTING BANDS for both Sexes; those for Ladies' use, before and after accouchement, are admirably adapted for giving adequate support with extreme lightness—a point little attended to in the comparatively clumsy contrivances and fabrics hitherto employed. Instruction for measurement and prices on application, and the articles sent by post from the Manufacturers and Inventors, POPE and PLANTE, 4, Waterloo-place, Pall-mall, London, S.W.

The Profession, Trade, and Hospitals, supplied.

Superphosphate of Iron and Super-

PHOSPHATE OF IRON and LIME. New Remedial Agents introduced to the notice of the Profession at the Meetings of the Medical Society of London, and now extensively employed by the most eminent members of the Medical Profession. The Syrup is the most eligible mode of administering these valuable Remedial Agents. Mr. GREENISH will be happy to forward a variety of cases which have been furnished to him, where its success has been most marked, and which will serve to indicate where it may be most advantageously employed.—20, New-street, Dorset-square.

Great Saving in the Purchase of New

MEDICAL GLASS BOTTLES and PHIALS at the NORTH LONDON GLASS BOTTLE WORKS, ISAACS and SON (Proprietors).—London Warehouses, 24 and 25, Francis-st., Tottenham-court-road, W.C.

2 oz. ditto		{ 7s. 6d. do.

A remittance not required till the goods are received. Packages free. Delivered free within seven miles. Post-office Orders payable to "S. Isaacs and Son," at Tottenham-court-road. Bankers: Unity Bank.

PURE SPIRITS FOR THE FACULTY.

S. V. R. 56 o.p., 17s. net Cash.—

This quotation admits of neither credit nor discount, and 1s. per gallon must be added for packages, to be allowed on their return.

HENRY BRETT and CO., Old Furnival's Distillery, Holborn.

H. Silverlock's Medical Label Ware-

HOUSE, Letter-Press, Copper-plate, and Lithographic Printing Offices, Wardrobe-terrace, Doctors'-commons, London, E.C.

H. SILVERLOCK'S stock of Labels for Dispensing purposes having been recently revised and enlarged, now consists of upwards of 800 different kinds. Yellow and Green Labels for Drug Bottles, Drawers, &c., at per book or dozen: a Book, containing a selection in general use in Surgeries or Dispensaries, 10s. 6d. Priced Catalogues of the above may be had, post free, on application. Printing of every Description at Moderate Prices.

To Students and others.—You will do

well to inspect the NEW STOCK of Messrs. MILLIKIN and LAWLEY, 161, Strand, adjoining King's College, where the best and most modern INSTRUMENTS may be had at very reasonable charges. Trusses, Crutches, Splints, Legs, and all kinds of Surgical Appliances, made to order with precision and despatch.

Dr. Caplin's Electro-Chemical Bath

ESTABLISHMENT, 9, YORK PLACE, BAKER STREET, PORTMAN SQUARE, for the extraction of Mercury, and other Metallic or Extraneous Substances, and the Treatment of Chronic Diseases. For the demonstration of this new system, vide the Second Edition, price 1s., 8vo, of Dr. Caplin's Treatise on the Electro-Chemical Bath, and the Relation of Electricity to the Phenomena of Life, Health, and Disease. Sold at the Author's Establishment

Those who cannot swallow Cod-Liver

OIL in its crude state should try NEWBERRY'S COD-LIVER OIL CAKES.—"The gingerbread is extremely light and pleasant, the flavour of the oil being completely covered."—Medical Times, Feb. 12th, 1859. Packets, 1s. 9d. and 3s. F. NEWBERRY and SONS (Proprietors of the "PULVIS JACOBI VER., NEWBERRY'S,") 45, St. Paul's-Churchyard, London. ESTABLISHED A. D. 1746.

Carriages, New and Second-hand, of

superior style, sterling quality, and finest finish at reasonable rates, for cash, credit, job, or exchange. Circular of prices on application. Credit given when required. Buyers should take carriages on trial, with power to purchase by yearly payments, and thus prove them.

OFFORD'S PATENT MEDICAL MAN'S BROUGHAM MANUFACTORY, 79, WELLS-STREET, OXFORD-STREET.

Human Osteology from France,

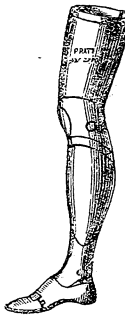

RAGINEL, 38, Ludgate-hill, City, E.C., London. Patronised by the Royal College of Surgeons of England. Illustrated Osteology on the bones themselves. Very large Stock on the lowest possible terms. Disarticulated Skulls, in twenty-two pieces, in box. All the bones of the disarticulated skulls will be fitted in right order in the presence of the purchaser so as to shew that every bone of each set belongs to the same Skull; it will be the same for all other disarticulated pieces. Skulls with Sections. Hands and Feet on catgut. Disarticulated Skeletons, quite complete, with the Skull same body. Articulated Male Skeletons, the bones very well marked. STUDENT'S CASE OF OSTEOLOGY, COMPLETE. Splendid Pieces for Lecturers and Museums.

Professors of Anatomy and STUDENTS

are invited to inspect the Stock of Skeletons, Skulls, separated and entire—Vertebrae, Hands and Feet on catgut, and various loose bones, which are well prepared, perfectly white, and free from grease or smell. The selection of this stock having been made by a good Anatomist, W. M. can confidently recommend them as being well marked, perfect bones, at low prices.

W. MATTHEWS, 8, Portugal-street, Lincoln's-inn-fields, London.

Pratt's Artificial Leg.

J. PRATT begs to call the attention of the Profession to the following Testimonial, just received:—

"Somerset,

June 20th, 1858.

"DEAR SIR,—It affords me much pleasure in being able to state that the Artificial Leg which you supplied me with is far beyond my best anticipations. From its being so LIGHT in WEIGHT, and its action in the foot so natural, I can walk, or ride on horseback, with ease and comfort; and few indeed would detect it as being other than natural. It has given me full satisfaction.

I am, dear Sir, yours very truly,

J. W.

To Mr. J. Pratt,
Surgical Instrument Maker,
420, Oxford-street."

TRADE MARK.

Brown & Polson's Patent Corn Flour,

preferred to the best Arrowroot. DELICIOUS in PUDDINGS, CUSTARDS, BLANCMANGE, CAKE, &c., and especially suited to the delicacy of CHILDREN and INVALIDS.

The Lancet states—"This is superior to anything of the kind known."

Trade Mark and Recipes, on each Packet, 4, 8, and 16 oz.

Obtain it from Family Grocers, Cheats, &c.

77A, Market-street, Manchester; and 23, Ironmonger-lane, London.

J. & E. BRADSHAW, late

Shoolbred and Bradshaw,

34, JERMYN-STREET,

beg to call attention to the various improvements in Patent ELASTIC STOCKINGS, BELTS, KNEE-CAPS, SOCKS, and Ladies' and Gentlemen's SPINE SUPPORTERS. A new description of BELT, invaluable for prevention of Cholera and the cure of Rheumatism, Lumbago, &c.

N.B. Every description of INDIA-RUBBER BANDAGE, vulcanised on the newest principle.

Directions for measurement sent by post.

N.B. A Liberal Discount to the Profession.

A Female to attend on Ladies.

GLENFIELD PATENT STARCH,
USED IN THE ROYAL LAUNDRY,
AND PRONOUNCED BY HER MAJESTY'S LAUNDRESS TO BE
THE FINEST STARCH SHE EVER USED.
Sold by all Chandlers, Grocers, &c. &c.

NEPENTHE, OR ANODYNE TINCTURE

(OBTAINED EXCLUSIVELY FROM OPIUM),

PREPARED AT THE LABORATORY OF FERRIS, TOWNSEND, LAMOTTE, & BOORNE,
MANUFACTURING CHEMISTS AND WHOLESALE DRUGGISTS, BRISTOL.

This preparation has now been for many years extensively used by a large number of eminent members of the Medical Profession with the greatest success. It does not produce headache, stupor, giddiness, prostration of strength, constipation, or the usual unpleasant symptoms attending the use of other preparations of opium.

Nepenthe has frequently been found of essential service in cases of Cancer, where every other opiate has failed.

The following Testimonials received from Medical gentlemen in extensive practice will be regarded as satisfactory proof of its efficacy:—

MEDICAL TESTIMONIALS.

"Having prescribed your 'Anodyne Tincture' in many cases, I would strongly recommend its more general adoption. It is especially useful in the wakefulness common after parturition, or other unusual exertion or excitement. It produces a refreshing sleep, and I do not remember any case in which it has caused the objectionable effects of the other opiate preparations."

"S. Wellington-street, London-bridge, August 14, 1856.

"SAML. GRIFFITH, M.D. London, M.R.C.P.
Consulting Physician-Accoucheur to the Farringdon Dispensary,
Physician-Accoucheur to St. Thomas's Hospital, &c."

"Gentlemen,—I have great satisfaction in bearing testimony to the value of your 'Nepenthe,' in relieving suffering from disease, and in procuring sleep where ordinary narcotics fail or disagree. For several months I have found it very effectual in relieving a great sufferer when all the ordinary anodynes had ceased to benefit, and although the dose has not been increased for months, the relief is as complete.

"Ipswich, March, 1859.

"'Nepenthe' is a very valuable addition to our means of relief, and the Profession and the public are greatly your debtors for it.

"I am, Gentlemen, yours obediently,

"EDWD. BECK, M.D. Cantab.

Physician to the East Suffolk and Ipswich Hospital."

"To Messrs. Ferris & Co.

"Gentlemen,—'Nepenthe' has, for some time, been a favourite narcotic with me, and I infinitely prefer it to any preparation of opium now extant. It has proved a remedy of great value in all cases of Neuralgia, Chronic Rheumatism, Hypochondriacism, and indeed all affections where the use of a sedative is indicated; and in Delirium Tremens it is certainly invaluable, performing its operation upon the system, without leaving those distressing feelings consequent upon the use of opiates in general.

"Portland-place, Reading, Nov. 21, 1856.

"I remain, Gentlemen, your obedient Servant,

"WILL. WOOD BRADSHAW, M.D. M.R.C.P. & F.R.C.S. Lond. &c. &c. &c."

Extract of a Letter from the late G. W. CAINES, Esq. M.R.C.S.

"Uffculme (Devon), Feb. 16, 1854.

"Please to send me some 'Nepenthe,' as I have a patient with cancer in the breast, with whom no other preparation of opium agrees. I have tried them all."

NEPENTHE may be procured direct from Messrs. FERRIS and CO., 4 and 5, Union-street, Bristol; from respectable Dispensing Chemist^s throughout the Kingdom; and from the following Agents:—

LONDON:—Mr. Thos. Keating, 79, St. Paul's-churchyard; Messrs. Evans, Lescher, and Evans, 60, Bartholomew-close; Messrs. Savory and Moore, 143, New Bond-street; Messrs. J. Bell and Co., 338, Oxford-st.
MANCHESTER:—Mr. James Woolley.
LIVERPOOL:—Messrs. Clay and Abraham; Messrs. Evans, Son, and Co.; Messrs. Clay, Dod, and Case.

BIRMINGHAM:—Messrs. Southall Bros. and Co.
YORK:—Messrs. Butterfield, Clarke and Co.
NORWICH:—Messrs. Smith and Sons.
PLYMOUTH:—Messrs. Balkwill and Co.
EXETER:—Mr. Geo. Cooper; Messrs. A. Evans and Co.
EDINBURGH:—Messrs. Raimes and Co.

As many imitations of Nepenthe have been attempted, the signature of FERRIS and COMPANY is placed over the cork of every bottle of the true preparation; and none purchased without this protection can be depended upon.

DR. DE JONGH'S

(Knight of the Order of Leopold of Belgium)

LIGHT-BROWN COD-LIVER OIL.

OPINION OF

EDWIN LANKESTER, Esq., M.D., LL.D., F.R.S.,

Late Lecturer on the Practice of Physic at St. George's Medical School, Superintendent of the Food Collection at the South Kensington Museum, &c. &c.

"I have much pleasure in bearing testimony to the excellent qualities of the Cod-liver Oil prepared under the superintendence of Dr. DE JONGH, of the Hague. I believe that the purity and genuineness of this Oil are secured in its preparation by the personal attention of so good a Chemist and intelligent a Physician as Dr. DE JONGH. He was the first Chemist who gave an accurate analysis of the Cod-liver Oil, and the discoverer of an organic substance which it contains.

He has also written the best Medical treatise on the Oil with which I am acquainted. Hence I should deem the Cod-liver Oil sold under his guarantee to be preferable to any other kind as regard genuineness and medicinal efficacy.—8, Savile-row, W., August 1st, 1859."

SOLE CONSIGNEES AND AGENTS,

ANSAR, HARFORD, & CO., 77, Strand, London, W.C.

WALTERS' INDIA-RUBBER URINALS.

F. WALTERS having originally invented these Urinals, begs to warn the Profession of the many bad and useless imitations which are now sold, and he would advise them, before purchasing, to look that they are stamped with his name; as, unless that be the case, he cannot guarantee them.

These conveniences are made for those who require them only occasionally, during a long journey, as well as for those invalids who use them always. Mr. WALTERS has much improved them by making them of *Etherised India-Rubber*, which adds very greatly to the strength of the India-Rubber, at the same time that it prevents its sticking together; by this means he is enabled to make them less stiff and harsh than hitherto, and yet to retain all the advantages of that stiffness. There is a patent valve, which prevents the return of the fluid; and they may be worn either sitting, walking, or lying, without the slightest inconvenience, and without being perceived by any one.

WALTERS' CONVENIENCES FOR LADIES will be found particularly useful during pregnancy. They are perfectly soft and flexible, and may be worn with perfect comfort.

All Orders must be accompanied by a Post-office order or reference.—Entrance for Ladies at the private door, where a Female attends.

MANUFACTURER OF ELASTIC STOCKINGS, BELTS, &c.

16, MOORGATE STREET, NEAR THE BANK, LONDON. E.C.

MEDICAL AGENCY.

NOTICE OF REMOVAL AND CHANGE OF FIRM.

Mr. Lara (for the last eight years the sole representative of LANE and LARA, Medical Agents and Arbitrators and Lunatic Asylum Registrars,) begs to inform the Profession that, in consequence of the daily increasing support with which he has been favoured, and for which he tenders his sincerest thanks and acknowledgments, he has taken into PARTNERSHIP Mr. James Maxfield Walters, a gentleman who has had considerable experience in the business. It will, therefore, from and after Christmas, 1858, be carried on, under the Firm of LARA and WALTERS, at 6, PUMP-COURT Middle Temple, E.C., whither they have removed their Offices from 22, Buckingham-street, Adelphi, in order to provide that larger accommodation which a constant intercourse with a great majority of the entire body of General Practitioners in England has rendered necessary.

Partnerships and Practices sold and valued: Asylums transferred: Arbitrations effected: Assistants provided (if for a permanence without charge to Employers): and every other description of business transacted for the Profession at a fixed and moderate cost. Attendance from 11 till 4.

King's College, London.—Professor-SHIP OF BOTANY.

This Office being now VACANT, the Council are ready to receive applications from gentlemen desirous of occupying themselves for the same. For further particulars apply to J. W. CUNNINGHAM, Secretary.

Royal Free Hospital.—Vacancy in the

Office of RESIDENT HOUSE-SURGEON. Candidates must be Members of the Royal College of Surgeons, London. Testimonials to be sent on or before the 16th inst. to the Secretary's office, where any further information may be obtained.

Evening Demonstrations of Anatomy.

—Mr. CHRISTOPHER HEATH, Demonstrator of Anatomy at the Westminster Hospital, will resume his Evening Course of DEMONSTRATIONS and EXAMINATIONS upon the DISSECTED SUBJECT on Wednesday, the 5th of October. The Demonstrations take place on Monday, Wednesday, and Friday evenings, during the Winter Session, from Seven to Nine o'clock, at the Westminster Hospital. Entrance Fee (perpetual), Five Guineas.

Stockport Infirmary.—Wanted, an

ASSISTANT HOUSE-SURGEON and APOTHECARY. He must be a Member of one of the Royal Colleges of Surgeons, and a Licentiate of the Apothecaries' Hall. His duties will be to visit home patients and assist in the duties of the house. Engagement for two years, at a salary of £50 per annum, with Board and Apartments in the Infirmary. Testimonials to be sent prepaid to Mr. S. W. Wilkinson, Hon. Sec., at the Infirmary on or before the 3rd of December. The Election will take place on Monday December 5th.

By Order of the Committee, S. W. WILKINSON, Hon. Sec.
Stockport Infirmary, October, 1859.

A Country Practice in a Manufacturing

District in Lancashire is for Disposal (or exchange with any gentleman's Practice of equal value). He must be of active habits; and may realise double the present value, £300. Apply, L. B. Medical Times Office

A Partnership Wanted immediately,

or ASSISTANTSHIP with a view to above, in the Country, by a M.R.C.S. Eng. and L.S.A., where a Moderate Premium is required. The most satisfactory references can be given. Address, Medicus, S. R., 13, Blenheim-terrace, St. John's-wood, London.

The Committee of Visitors of the

LUNATIC ASYLUM for the Counties of Bedford, Hertford, and Huntingdon lately erected near Arisey, Bedfordshire, are prepared to appoint an ASSISTANT MEDICAL OFFICER to the Asylum, with a salary of £70 per Annum, with Board, Washing, and Furnished Apartments. He must be a Member of the Royal College of Surgeons, London, and a Licentiate of the Apothecaries' Company, and duly registered according to law. He will be expected to enter upon his duties early in the ensuing year, on the opening of the Asylum. Applications, with testimonials, and a statement of Professional Qualifications, age, and previous engagements, to be addressed to the Committee of Visitors, under cover to the Clerk to the Visitors, St. Cuthbert-street, Bedford, on or before the 19th of December next, who will give any further information that may be required.

Bedford, October 10, 1859.

Northampton General Lunatic

ASYLUM.—A RESIDENT MEDICAL SUPERINTENDENT is REQUIRED for this Institution. He must be either a Doctor of Medicine of one of the Universities of the United Kingdom, where residence and exercise are required to take a Degree, or a Fellow or Member of the Royal College of Surgeons of England, and must have had experience in the treatment of Insanity. He must be a Member of the Church of England, and married. Salary, £400 per annum, with Furnished Apartments, Board and Attendance. Candidates qualified as above are requested to send in their Testimonials to the Secretary, on or before the 23rd day of November next. Candidates whose qualifications are approved will be invited to attend a Meeting of the Directors (at their own expense), of which they will receive notice, and the Testimonials of other Candidates will be returned. The Gentleman selected will be required to enter upon his duties on the First day of February, 1860.

The Asylum, Oct. 27th, 1859.

JOHN GODFREY, Secretary.

Medical Transfer and Partnership.

30, Bucklersbury, Cheapside.

Mr. Orridge, Medical Transfer Agent,

Referee, and Valuer of Medical Property, may be consulted, at the above Address, by Gentlemen about to receive PARTNERS, or to RELINQUISH or to COMMENCE Practice.

Mr. Orridge is known to many of the Hospital Physicians and Surgeons of London.

He has been concerned professionally for a considerable proportion of the most influential Practitioners (including Partners in many of the leading Medical Firms), to whom he has the satisfaction of being permitted to refer—a privilege that he trusts will be regarded as a proof of the sincerity of his endeavours to conduct these transactions in an honourable and straightforward manner.

Gentlemen desirous of obtaining Mr. Orridge's opinion, or requiring his attendance professionally in any part of England, can obtain terms on application, by (confidentially) transmitting name and address.

Office Hours, from Eleven to Four.

Surgeon-Dentist.—The Committee of

the City of London and East London Dispensary desire to receive applications for the above office. The appointment is Honorary, and attendance required two mornings each week. Applications, enclosing testimonials, to be forwarded on or before Monday, the 21st inst., to the Secretary, G. Reid, Esq., at the Dispensary, 40, Wilson-street, Finsbury, E.C.

Tunbridge-Wells Infirmary and

DISPENSARY.—WANTED, a RESIDENT HOUSE-SURGEON and MEDICAL ASSISTANT. He must be unmarried, a Registered Surgeon, and a Licentiate of the London Company of Apothecaries. His duties will be to dispense, and to attend, under the direction of the Physicians and Surgeons, the in-patients, and those out-patients who reside within one mile of the Infirmary, and are too ill to attend there. He will also be required to act as Secretary. No Private Practice allowed, and he must engage not to practise within five miles of the Infirmary for three years after quitting office. Salary to commence at £100 per annum; furnished apartments, rent free in the Infirmary, with coals and candles. Candidates must forward their certificates and testimonials, carriage paid, to "the Secretary, Infirmary, Tunbridge-Wells," on or before Saturday, December 3. Personal attendance not necessary. The appointment will be made on Monday, December 5. The duties will commence on Saturday, December 17.

November 8, 1859.

To the Medical Profession.—W. Barclay

SNOW is instructed to LET a very DESIRABLE RESIDENCE, with its appropriate Fashionable FURNITURE, the Property of a Gentleman who has received an Appointment. The whole will be Sold under its Value, and an introduction given which might be greatly extended in a first-class and promising district near Town, in Kent. This is a rare opportunity for a Gentleman commencing. For particulars and terms apply at the Agency Offices, 47, Mortimer-street, Cavendish-square, W.

Medical Society of London, Lettsomian

LECTURES, "On Certain Points connected with Diabetes," with Experimental Illustrations. By F. W. PAVY, M.D., Professor of Physiology at Guy's Hospital. Each Lecture will commence on the three following Wednesdays, viz. Nov. 23, 30, and Dec. 7, at Half-past Eight, p.m. precisely.

F. W. MACKENZIE, M.D., } Hon. Secretaries.
THOMAS BRYANT,

32A, George-street, Hanover-square, W.

Insanity, Nervous Debility, &c.—Male

and FEMALE ATTENDANTS of good character and experience can be immediately obtained on application to S. Brookes, Chemist, 62, Lisson-grove, N.W., London.

The Transfer of an excellent and good

class COUNTRY PRACTICE of between £700 and £800 a-year, can be immediately arranged. The Vendor will shortly be in Town, and will be happy to give full personal particulars of the Practice. Address, F.R.C.S., care of J. Bowmer, Esq., 50, Lincoln's-Inn-Fields, W.C.

Medical.—For immediate Transfer, a

SMALL GENERAL PRACTICE, pleasantly situated in the County of Kent. Population about 2,000. Opposition limited. A convenient house, with excellent Surgery well fitted up and stocked, Coach-house, and three acres of Garden and Orchard Ground. Rent £22 a-year Premium to an immediate purchaser, 75 Guineas. Apply to Mr. Bowmer, 50, Lincoln's-Inn-Fields, W.C.

BASTICK'S OLEO CUBEbine.

This Elegant Preparation consists of

the active principles of cubebs—namely, the cubebine and the essential oil in their most effective and least nauseous form. It has been administered with very satisfactory results in gonorrhoea and other diseases where the use of cubebs is indicated. It forms an excellent combination with copaiba balsam. Dose, thirty to sixty minims in an emulsion or floating on water.

Pharmaceutical Laboratory, 2, Brook-street, Bond-street, London.

London: Printed by CHARLES REED and BENJAMIN PARDON of 1, 2, and 3, Lovell's-court, Paternoster-row, in the City of London, and published by JOHN CHURCHILL, at the Publishing Office, No. 11, New Burlington-street, in the Parish of St. James, in the City of Westminster.—November 12, 1859.

The Urine, in Health and Disease;

or, a Simple Explanation of the Physical Properties, Composition, and Uses of the Urine, of the Functions of the Kidneys, and of the Treatment of Urinary Disorders. By ARTHUR HILL HASSALL, M.D. "For the production of a work like the present, a very full knowledge of the subject is required on the part of the writer, and for the successful execution of the task none could be better qualified than Dr. Hassall. . . . From its perusal the student or practitioner may in a brief period become acquainted with nearly everything connected with the urine and urinary disorders which is really important."—The Lancet.

John Churchill, New Burlington-street.

Just published, 8vo, cloth, 12s.

Illustrated by 17 Coloured Figures and 41 Woodcuts,

On Wounds and Injuries of the Eye.

By W. WHITE COOPER, F.R.C.S., Surgeon-Oculist in Ordinary to Her Majesty, Ophthalmic Surgeon to St. Mary's Hospital, &c.

"A book of very practical character, and one that contains a large amount of information on a subject upon which hitherto we have possessed no English monograph. The volume is profusely and elegantly illustrated, and bids fair to become a favourite with the Profession."—Medico-Chirurgical Review.

"We consider that a more able exposition of the doctrines of the new school of Ophthalmic Surgery, than Mr. White Cooper's work, has not emanated from the Medical press of this country."—British Medical Journal.

John Churchill, New Burlington-street.

Just published, 8vo, cloth, 7s.

Dedicated by permission to the Right Hon. the Earl of Shaftesbury,

On the State of Lunacy and the Legal

PROVISION for the INSANE; with Observations on the Construction and Organisation of Asylums. By J. T. ARLIDGE, M.B., A.B., L.R.C.P. (Lond.), formerly Medical Superintendent of St. Luke's Hospital.

John Churchill, New Burlington-street.

Third Edition, fcap. 8vo, cloth, 12s. 6d.

A Manual of Materia Medica and THERAPEUTICS.

By J. FORBES ROYLE, M.D., F.R.S., and F. W. HEADLAND, M.D. "The style and method of Dr. Royle are all that could be desired in an elementary work. The wood engravings, by which the different crystals, the various parts of the vegetable products, and the medicinal animals, are illustrated, are better than anything hitherto attempted in this department of Materia Medica, and must prove a great assistance to the student, appealing as they do more powerfully to the mind than the most careful verbal descriptions taken alone could do."—Lancet.

John Churchill, New Burlington-street.

8vo, cloth, with numerous Tables, price 15s.

Practical Midwifery: comprising an

Account of 13,748 Deliveries, which occurred in the Dublin Lying-in Hospital, during a period of Seven Years, commencing November, 1847. By EDWARD B SINCLAIR, A.B.T.C.D., Fellow of the King and Queen's College of Physicians in Ireland; Member of the Royal College of Surgeons of England; Ex-Assistant Physician to the Dublin Lying-in Hospital; &c. &c.: and GEORGE JOHNSTON, M.D. Edin., Licentiate of the King and Queen's College of Physicians in Ireland; Member of the Royal College of Surgeons of England; Ex-Assistant Physician to the Dublin Lying-in Hospital: &c. &c.

OPINIONS OF THE PRESS.

"Drs. Johnston and Sinclair aim at putting the Profession, as far as possible, in the same enviable possession of extensive experience as they have themselves. This they do by giving as complete an account as they can of all that they have seen and done, using the form of statistics to secure accuracy and brevity. This is a most useful work, and admirably done."—Edinburgh Medical Journal.

"We cannot withhold our conviction that, whether this work be viewed as a record of clinical experience, or as a depository of well-digested statistical data, it stands unequalled in obstetrics, or, we believe we may truly add, in Medical literature."—Dublin Medical Press.

"Drs. Johnston and Sinclair have had no small field for close observation, and undoubtedly they have done very wisely in presenting the results of their experience to the Profession."—The Lancet.

"We now leave this part of the Report (Instrumental Deliveries), of which, if we have not grievously failed in our purpose, we have said enough to make our readers anxious to study it for themselves; and we have no doubt but that those who do so will agree in pronouncing it one of the most important contributions that has been ever made to practical Midwifery, and one that will afford material for thought so long as obstetric science is cultivated. The anxious care with which the facts have been arranged, tabulated, and compared, so as to bring all into due prominence, must ever reflect credit on the authors, and will, without doubt, serve to advance obstetric medicine."—Dublin Quarterly Journal of Medical Science.

"It is, in truth, an inexhaustible mine of clinical and statistical information upon all subjects connected with Practical Midwifery. The details of practice are particular, without being tedious or unnecessarily minute."—Dublin Hospital Gazette.

London: John Churchill, New Burlington-street.

STUDENT'S CASE OF OSTEOLOGY, COMPLETE. Splendid Pieces for Lecturers and Museums.

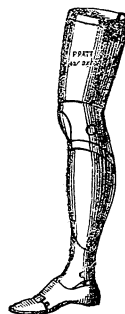

Anatomical Students are

invited to inspect the Stock of Skeletons, Skulls, separated and entire—Vertebrae, Hands and Feet on catgut, and various loose bones, which are well prepared, perfectly white, and free from grease or smell. The selection of this stock having been made by a good Anatomist W. M. can confidently recommend them as being well marked, perfect bones, at low prices.

W. MATTHEWS,

Surgical Instrument Maker to King's College Hospital, 8, Portugal-street, Lincoln's-inn, W.C.

Pratt's Artificial Leg.

J. PRATT begs to call the attention of the Profession to the following Testimonial, just received:—

“Somerset, June 20th, 1858.

“DEAR SIR,—It affords me much pleasure in being able to state that the Artificial Leg which you supplied me with is far beyond my best anticipations. From its being so LIGHT IN WEIGHT, and its action in the foot so natural, I can walk, or ride on horseback, with ease and comfort; and few indeed would detect it as being other than natural. It has given me full satisfaction.

I am, dear Sir, yours very truly, J. W.

To Mr. J. Pratt, Surgical Instrument Maker, 420, Oxford-street.”

Brown & Polson's Patent Corn Flour,

preferred to the best Arrowroot. DELICIOUS IN PUDDINGS, CUSTARDS, BLANCMANGE, CAKE, &c., and especially suited to the delicacy of CHILDREN and INVALIDS.

The Lancet states—“This is superior to anything of the kind known.”

Trade Mark and Recipes, on each Packet, 4, 8, and 16 oz.

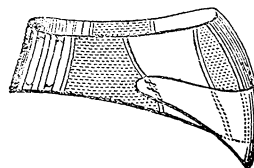

Obtain it from Family Grocers, Chemists, &c.

77A, Market-street, Manchester; and 23, Ironmonger-lane, London.

J. & E. BRADSHAW, late

Shoolbred and Bradshaw, 34, Jermyn-

STREET, beg to call attention to the various improvements in

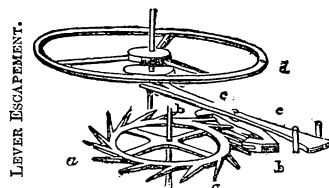

PATENT ELASTIC STOCKINGS, BELTS, KNEE-CAPS, SOCKS, and Ladies' and Gentlemen's SPINE-SUPPORTERS. A new description of BELT invaluable for prevention of Cholera, and the cure of Rheumatism, Lumbago, &c.—N.B. Every description of INDIA-RUBBER BANDAGE, vulcanized on the newest principle.

Directions for measurement sent by post. N.B. A liberal Discount to the Profession.

A female to attend on Ladies.

JOZEAU'S COPAHINE MEGE

Or SACCCHARATED CAPSULES.—Copaiba and Cubebs are, doubtless, the best remedies, but these drugs are of a repulsive taste and odour, and occasion colicky pains, nausea, and gastric disturbance. M. Jozeau has succeeded in rendering these valuable therapeutic agents perfectly innocuous, by increasing, in his Copahine, all the curative properties. This preparation has been adopted by the Paris Academy of Medicine, after more than a thousand trials in Paris, and the different London Hospitals, viz., St. Thomas's, Guy's, and St. Bartholomew's, under the care of Messrs. Lloyd, Poland, and Le Gros Clark. “Lancet,” Nov. 6, and Dec. 10, 1852. The Copahine, which is in form of a pretty pink sugar-plum, effects a cure in about six days, either in recent or chronic diseases. 100 Capsules, 4s. 6d., at G. JOZEAU'S, French Chemist, 49, Haymarket, London; 22, Rue St. Quentin, Paris; and all the most important Chemists.

Benson's
WATCHES.

33 & 34, LUDGATE-HILL, LONDON, E.C. ESTABLISHED 1749.

For Infants.—The British Feeding

BOTTLE (registered) may be placed in any position without the Food running out. The supply can be regulated by a stop-cock; being electroplated, it may be instantaneously cleaned. Unlike wood, ivory, or bone, it is impervious to moisture, cannot crack or become sour; there is no possibility of the infant drawing air with the food.

By W. T. COOPER, Pharmaceutical Chemist, 26, Oxford-street, London.
Price 7s. 6d., or free to any Railway Station, 8s. 6d.

Pillischer's Achromatic Microscopes.—

To meet the daily increasing demand for his Microscopes, M. PILLISCHER has recently completed extensive alterations in his workshops to enable him to manufacture MICROSCOPES and their Object Glasses upon a more expeditious and extensive scale. M. P. has the pleasure of informing the Profession that he is now able to furnish Microscopes of the very greatest perfection; possessing every modern improvement; and with Object Glasses of a quality unsurpassed by any other maker, on the shortest notice, and at very moderate prices.

PILLISCHER'S £7 7s. STUDENT'S MICROSCOPE, for which a Prize Medal was awarded to him at Paris Exhibition, 1855, deserves particular notice. It consists of a well-constructed Stand, with coarse and fine adjustments, a capital Stage, with Diaphragm and Large Mirror, one Eye-glass, one and one quarter inch Object Glasses, 16" and 75" angular aperture, and a neat Mahogany Case about 7 in. square. The above, Microscope when further completed with the addition of a Second Eye-glass, Condenser for Opaque Objects, Live Box, Stage Forceps, large Glass Stage, and Polarising Apparatus, price £10, forms a most complete and valuable Microscope, and in every respect as useful as a much more expensive one.

A Catalogue post free on application to M. Pillischer, Optician, 88, New Bond-street, London, W.

TREASURER—Robert Dunn, Esq.

BANKERS—Messrs. Gosling and Sharpe, 19, Fleet-street.

SECRETARY—John Capes, Esq.

The objects of the Society are—

1st. To provide a safe and efficient medium by which the Medical Profession may secure more certain and regular payment for their services, with every consideration for the convenience of those who are willing, but unable directly to discharge their liabilities; with rigour from those who are able, but have not the disposition, to remunerate medical men.

These ends to be accomplished without interfering with the valuable time of the Members of the Profession, or exposing them to the unpleasantness which necessarily attends applications for money, or to the uncertainty and risk of employing private collectors.

2nd. To assist members with information and advice in the purchase and sale of practices.

3rd. To raise a Benevolent Fund by devoting to that object the profits arising from the general operations of the Society.

The Society consists of qualified Medical Practitioners only. Annual Subscription, One Guinea; a Firm, consisting of Two Partners, a Guinea and a-half; a Firm of three Partners, Two Guineas. Fixed rates of Commission are also charged on Business transacted.

The general business is carried on by a staff of officers at the Central Office, 43, Lincoln's-inn-fields, together with trustworthy employes appointed in town and country, the whole of whom are under the direction and superintendence of the Committee.

The Metropolitan Members of the Committee, with the Trustees, are responsible for all moneys received by the Staff.

ESTABLISHED 1834.

Universal Life Assurance Society,

1, KING WILLIAM-STREET, E.C.

BRANCHES AT CALCUTTA, MADRAS, AND BOMBAY.

Empowered by Special Act of Parliament, 6 William IV. c. 54.
For the Assurance of Lives, at Home and Abroad, in the Civil, Military, and Naval Services.

The Funds Invested and the Subscribed Capital exceed £1,180,000.

DIRECTORS.

John Stewart, Esq., Chairman.
Charles Dashwood Bruce, Esq., Deputy-Chairman.
Augustus Bosanquet, Esq.
Ellis Watkin Cunliffe, Esq.
Herbert George Jones, Esq., at-Law.
William Kilburn, Esq.
John Farley Leith, Esq.
Francis Macnaghten, Esq.
Major John Arthur Moore.
William Norris Nicholson, Esq.
William Rothery, Esq.
Brodie M'Ghie Wilcox, Esq. M.P.

AUDITORS—Rt. Gardner, Esq.; Rt. Hichens, Esq.; H. W. Ripley, Esq.

BANKERS—The Bank of England, and Messrs. Currie and Co.

SOLICITORS—Messrs. Cotterill and Sons, and Messrs. Parke and Pollock.

PHYSICIAN—Geo. Burrows, M.D., F.R.S., 18, Cavendish-square.

SECRETARY—Michael Elijah Impey, Esq.

After the operations of a Quarter of a Century, the Directors invite, with great confidence, the attention of the Public to the marked success which has attended this Society, and to the strong claims it possesses to the confidence and support of all classes desirous of effecting Assurances on Lives. Combining the advantages of a Mutual and a Proprietary Company, and without attempting a rash competition with other Offices, it has pursued a steady, progressive course, affording all the benefits which, consistently with security to Assurers and Assured, can possibly be given.

The amount of the Society's Funds actually Invested exceeds £730,000. Upwards of £997,380 have been already paid in Claims and Bonuses, and the existing Policies amount to £2,214,928.

The Tables of Rates for Residents in Europe have been prepared upon the most approved principles to ensure moderation and security.

Assurances can be effected with or without a Participation of Profits; on ascending or descending scales; and for a limited number of payments.

The Society advance money on Mortgage; purchase Reversions and Life Interests; and grant Loans on such Securities and on Policies.

An Annual Division of One-fifth of the Profits is made, 75 per cent. of which is appropriated to Policy-holders, and 25 per cent. to the Shareholders; the remaining four-fifths are set apart towards the average of succeeding years. The Assurers can apply their Profits to the immediate Reduction of their Premiums, or as a Bonus to the sum assured.

All Medical Fees and Stamps are paid by the Society.

INDIAN BRANCH.

The Universal was the first Assurance Society that secured to Residents in India fixed rates and the advantages enjoyed by those in Great Britain.

Separate Tables for the Civil and Military Services were originally framed with the utmost care from the Records of the India House, and valuable statistical returns accessible to this Society alone. To test their adaptation to the present time, and to ascertain whether any reduction could be safely made, they have recently undergone a minute and laborious investigation by two eminent London Actuaries, whose Report has established their soundness and accuracy.

Notwithstanding the extraordinary mortality occasioned by the late Mutiny, the Directors were enabled at the last Annual Division of Profits to announce a Reduction of Premiums on all Policies dated prior to 11th May, 1854, of £36 per cent.—a result attributable, in a great measure, to the correctness of the Rates and the judicious management of the Local Committees in India.

The attention of persons proceeding to India, and of residents there, is requested to a peculiar and most important advantage offered by this Society,—that on the return of Assurers to Europe the premiums on their Policies will be reduced to the English scale corresponding with the age when the Assurance was effected, without reference to the state of their health on their return.

Tables of Rates and all further information will be afforded at the Office in London, or by the Agents in India:—

Messrs. BRADDON and Co., Calcutta.

Messrs. BAINBRIDGE, BYARD, GAIR, and Co., Madras.

Messrs. LECKIE and Co., Bombay.

MICHAEL ELIJAH IMPEY, Secretary.

King William-street, E.C., June 1, 1859.

INDIA RISK ASSURANCES.

Family Endowment Life Assurance

AND ANNUITY SOCIETY.

Established 1835, empowered by Special Act of Parliament. Head Office, 42, New Bridge-street, London, E.C., with Branches and Agents at Calcutta, Madras, Bombay, Agra, and Hongkong, as well as throughout the United Kingdom.

Subscribed Capital, Half-a-Million. Annual Income, upwards of £50,000. Accumulated Invested Fund, £200,000.

This Society transacts every description of Assurance business, and offers to Insurers great facilities and advantages, combined with perfect security. Eighty per cent. of the profits belong to the assured.

Parties about to proceed to India may effect insurances on highly favourable terms, and are invited to examine the Society's general and special advantages, as set forth in the prospectus of the Indian Branch.

Active Agents are required in all districts not efficiently represented, to whom liberal commissions will be allowed, and at the death of an agent one-half of the ordinary renewal commissions of the agency will (under a fixed condition), be continued to his widow or other nominee during life.

Medical men introducing business to the Society are allowed the same Commissions as are allowed to Solicitors.

Applications for agencies, prospectuses, and further information may be addressed to

EDWIN H. GALSWORTHY, Actuary and Secretary.

ORIGINAL LECTURES.

CLINICAL LECTURES

ON

THE DISEASES OF WOMEN.

By J. Y. SIMPSON, M.D. F.R.S.E.

Professor of Medicine and Midwifery in the University of Edinburgh.

LECTURE XXIV.

ON OVARIAN DROPSY.—ITS SYMPTOMS AND DIAGNOSIS.

GENTLEMEN,—In my last lecture I spoke of some of the leading points in connection with the pathological anatomy of cystic diseases or dropsies of the ovary, and showed you that they sometimes, though rarely, assumed the unilocular form,—that by far their most frequent type was the multilocular,—that in some cases the malady appeared in the form of a colloid growth,—and that, lastly, it was sometimes combined and complicated with malignant disease or degeneration of the component walls of the cysts. Before passing on to the consideration of the Symptomatology of the disease, let me only state in addition here, that there has been a great deal of discussion as to the probable causes, or

THE ÆTIOLOGY OF THE DISEASE.

Now this is a point regarding which our positive knowledge amounts to almost nothing. We do not know why an ovary ever enlarges and assumes this form of morbid growth or dropsy; nor why the tumour should take on a different type of development in different cases. We know that the disease occurs alike in the married and in the unmarried; and when present in the former it does not always form a necessary hindrance to the occurrence of impregnation. Sometimes ovarian dropsy is found to be associated with an overturn of all the menstrual functions; but in many cases these functions are carried on, in the earlier stages, at least, of the malady unaltered and unimpaired. Age seems to have little specific influence; for although the disease is most frequently seen between the ages of thirty and forty, yet it sometimes does not occur, or, at least, is not observed till much later in life, and till the function of menstruation has long passed; while again, in other instances, you will occasionally find the malady fully developed by the twentieth or twenty-fifth year of life. In some few and rare cases ovarian dropsy seems to be hereditary, being developed in one or two females in successive generations of a family. I have known the disease affect three sisters in a family. The right ovary is somewhat more frequently affected than the left. Both ovaries may be simultaneously diseased, and in that case we usually find one preponderating greatly in size over the other; but I know of no satisfactory reason that has been given to explain why the one should become the seat of the disease in any case in preference to the other. The fact that both ovaries are not unfrequently affected in the same patient is a strong reason for the belief that the malady has its origin often, though it may not be always, in constitutional rather than in local causes and changes. But, I again repeat, we know as yet little, or indeed nothing, regarding the ætiology of ovarian dropsy, and let us pass on to the consideration of

THE SYMPTOMATOLOGY OF THE DISEASE.

In studying the symptoms of any disease of the organs of generation, the first point for inquiry is, as to whether there be any particular disturbance of the functions of these organs, which should lead us to guess at the probable occurrence of the special disease.

1. *Functional Derangements of the Generative System.*—You will greatly err, let me at once tell you, if you expect to find any particular disturbance of the generative organs, or any special and constant interference with their functions in connexion with ovarian dropsy, dependent on the presence of that disease, and, therefore, indicative of its occurrence. The strangest mistakes have often enough been made by those who have become possessed of erroneous ideas upon this point, and the most unmistakable cases of the disease have been altogether misunderstood in consequence. I once saw

VOL. XL. No. 1051.—NEW SERIES, No. 490.

a case, where the nature of the disease was most evident, and the merest tyro could have diagnosed it correctly, and with certainty by physical diagnostic means; yet the old and excellent Practitioner who had charge of the patient, could hardly be convinced that the case was one of ovarian dropsy, because the menstrual functions were unaffected, and altogether normal. That these functions may proceed naturally and normally in cases of this disease is a fact, then, that you would do well to impress upon your memory. Often enough, indeed, these functions are interfered with; and they may be altered in every possible way. The catamenia may be suppressed and the patient has Amenorrhœa—a condition of little moment as a diagnostic mark, particularly in those who have passed the climacteric period of life. Or, on the other hand, the flow may be excessive; though such a form of altered menstruation is of more rare occurrence; and the patient suffers from Menorrhagia. Or the performance of the function may be attended with pain; and the patient is the subject of ovarian Dysmenorrhœa. Any of these deviations from the normal course of menstruation, may be found present in any case of ovarian disease; but often enough we can find none of them; and, most certainly, no one of them can be regarded as in any way pathognomonic of the disease. In short, all our knowledge of the matter amounts to this,—that the menstrual functions may be found quite natural, especially in the earlier stages of the malady; or they may be perverted in every possible way. But does the disease not interfere, you may ask, with the other functions of the generative organs? Though the uterine hæmorrhagic secretion be duly furnished, may not the product of the ovary be withheld and sterility result from the ova not being formed, or not finding their way into the cavity of the uterus? Even here there is not necessarily any disturbance, for patients affected with ovarian dropsy occasionally become pregnant and bear children; though, assuredly, in a smaller proportion than married women who are free from all disease. Many years ago, in investigating the subject of the alleged comparative sterility of females born co-twins with males, I had occasion to estimate the proportion of barren women among ordinary married females in general society, and I found that about one in every ten was sterile. In the case of married persons suffering from ovarian dropsy, the proportion of childless to child-bearing patients is usually estimated as one to three or four; so that the presence of the disease has a marked effect upon the chances of conception. But the disease, I repeat, does not necessarily prevent impregnation, even when the ovary is very much enlarged. If, then, you try to lay down any rule as to the diagnosis of ovarian dropsy, founded upon aberrations in the functions of the generative organs,—that is to say, in the functions of menstruation, conception, and pregnancy,—you will fail completely; for, as I have said, there is no deviation or disturbance of these functions found in such constant connection with the disease as to make it of any sufficient value as a diagnostic sign.

2. *Constitutional Symptoms.*—Some authors have spoken of nausea and vomiting as symptoms indicative of the presence of ovarian tumours; and patients who are the subject of them do suffer, not unfrequently, from disorder of the stomach. But nausea and vomiting do not, by any means, necessarily or even frequently occur when the ovary becomes enlarged and dropsical; and these same symptoms too frequently result from other causes to be of any value as a sign of this form of disease.

3. *Local Mechanical Symptoms.*—The earliest indications of any certainty seen in connexion with the development of an ovarian growth, are usually the symptoms produced by the pressure of the tumour on the surrounding pelvic organs; and they are thus all chiefly of a mechanical kind. Thus the patient may complain of a numbness and relative weakness of one of the lower extremities, caused by the pressure of the tumour on the sacral nerves of the limb. Or she has a feeling of dragging, or of a weight in one or other side, from the stretching of the ovarian and uterine ligaments, and the size of the enlarging growth. From its pressure on the bladder, again, the tumour may give rise to dysuria; or it may interfere with defecation, from its pressure on the rectum. But the existence of these symptoms is not at all enough to entitle you to decide upon the presence of an ovarian tumour; for you may have mechanical irritations and injuries of precisely the same kind from totally different causes. In

short, there are no rational symptoms on which you can depend as pathognomonic of the presence of an ovarian tumour. This observation holds good for almost every form of disease to which the organs of generation are liable; and for ovarian dropsy, as for all the others, you can, as a very general if not a universal law, never make perfectly and practically sure of the real nature of the case without having recourse to

PHYSICAL DIAGNOSIS.

The physical signs of ovarian dropsy vary according as the tumour is in the first or second stage of its growth—according, namely, as it still is limited in size, and lies in the pelvic cavity, or has enlarged and ascended above the pelvic brim and begun to occupy a space among the abdominal organs. For I must here remark—as perhaps I ought to have done sooner—that when the tumour is small in size it still lodges within the pelvis, and it does not rise into the abdominal cavity until it has attained such dimensions that there is no longer any room for its expansion within the pelvic cavity. We see the same phenomenon in the case of the retroverted uterus when it becomes impregnated; for, instead of rising gradually into the abdominal cavity, it remains hidden in the pelvis till about the fourth month of utero-gestation, and then ascends, sometimes almost suddenly, into the more roomy abdomen above.

I. WHEN THE TUMOUR IS STILL IN THE PELVIS.

It is comparatively rare that the advice of the Medical Practitioner is required for a cystic ovarian tumour while the tumour is still of such small dimensions as to find space enough for its development within the confines of the pelvic cavity. The mere mechanical symptoms produced by pressure and irritation upon the neighbouring pelvic organs, sometimes induces the patient to consult her Medical attendant, and the diseased ovary may be thus discovered by a vaginal examination while still early in its course. There are also other cases in which cystic tumours of the ovary become the objects of diagnosis and treatment while still small, and contained within the pelvic cavity; as, for example, when the tumour happens to be attacked with inflammation and becomes the seat of pain, or where the patient has become pregnant and the ovarian growth is found obstructing the passage of the child when the time comes for her delivery; or, when the enlarged ovary has changed its place and fallen down into the bottom of the peritoneal sac between the rectum and the vagina. It is certainly not very common to meet with a simple cystic tumour of the ovary small enough to be lodged within the pelvis, maintaining its normal position up at the inlet of the cavity, and yet causing so much distress to the patient as to lead her to seek for Medical aid. But when, instead of remaining at the brim and enlarging towards the abdominal cavity, the tumour sinks down into the lower part of the pelvis, then its presence comes to interfere with the function of the pelvic organs, and may prove a source of great discomfort and distress. Such displacements of the ovary, as you know, have been shown by Dr. Rigby to be of not unfrequent occurrence, even when the organ is healthy and unchanged; and if the normally-sized ovary proves a source of annoyance to the patient when it prolapses down upon the roof of the vagina, it will only distress and annoy her the more when, in addition to being displaced, it is at the same time increased in size. When such a dislocation of the ovary occurs, where is it to be found? When the ovary, in enlarging maintains its normal position at the inlet of the pelvis, it is felt, per vaginam, to lie mostly to one or other side of the uterus, and somewhat behind it; and if the enlargement have gone to any considerable extent the uterus will most likely be found displaced, being pushed forward and lying to one or other side. But when the ovary is dislocated the uterus is felt to be in its normal situation, while at the upper part of the vagina, behind the cervix uteri, the exploring finger comes into contact with an unusual projection, due to the presence of the prolapsed organ in the recto-vaginal fold of the peritoneum. For, you will please to remember, the ovary is attached to the broad ligament on its posterior aspect, and when such a relaxation of the ligament of the ovary itself occurs as to permit the ovary to fall out of its place, it necessarily falls backwards and downwards behind the uterus till it comes to rest, as I have said, in the sac of the peritoneum, which is known as the cavity of Douglas. There it forms a

tumour oval in form, and readily moveable with the finger, projecting into the posterior cul-de-sac of the vagina on the one hand, and on the other pressing upon and partially occluding the cavity of the rectum. The situation, the form, and the mobility of the tumour, more especially when conjoined with the peculiar sickening pain which is sometimes produced in it by pressure—a pain resembling in character that which results from pressure on the testicle—will usually serve to guide you to a correct diagnosis of the nature of the case. But to attain absolute certainty something more is required; for a tumour situated on the back wall of the uterus, or even the fundus of the retroflexed uterus itself, might be found to present all the characters of which I have spoken, and to distinguish between such tumours and a prolapsed ovary, you must endeavour to ascertain whether the tumour moves consentaneously with the uterus; or whether it is still capable of free and independent motion after the uterus has been fixed. With this view you must keep the finger always in contact with the cervix uteri, while testing the degree of mobility of the tumour; or, better still, you must introduce a sound into the cavity of the uterus, which will at once dispel all doubt as to the probability of a retroflexion of that organ, and by which you can keep the uterus steadily fixed, while with the finger you ascertain whether or not the tumour is still freely moveable. If, let me add, you find the tumour to be soft and fluctuating, your certainty as to the nature of it will be all the greater, and in such a case you would rightly conclude that the organ had begun to be the seat of a cystic degeneration.

II. WHEN THE TUMOUR HAS ENTERED THE ABDOMEN.

Usually, however, it is not till an ovarian cystic growth has risen above the brim of the pelvis, and ascended into the cavity of the abdomen so as to have become partially or entirely abdominal, that the disease gives rise to symptoms of such urgency as to lead the patient to seek for Medical advice or aid, and then you will have to make out the nature of this abdominal tumour. In attempting to do this there are various points to be attended to.

1. *The Position of the Tumour.*—Reasoning hypothetically only, you might think it would always be easy to distinguish between an ovarian and a uterine tumour by finding the former lying to one side of the abdominal cavity. The uterus you know to be placed in the mesial line of the body, while the ovaries are situated on either side, and you might naturally suppose that in enlarging the organs would maintain these respective positions. Such actually does occur in some cases, and to a certain extent. You will sometimes be guided to a direct diagnosis of the existence of an ovarian tumour by being told by the patient that she noticed it first in one or other side, and in the lowest part of the abdomen. But when the tumour has attained such a size as to cause it to interfere seriously with the functions of the abdominal organs and the diaphragm, and to bring the patient into such distress or danger as to induce her to seek your aid—and, let me warn you, the tumour may sometimes have attained to a great bulk before

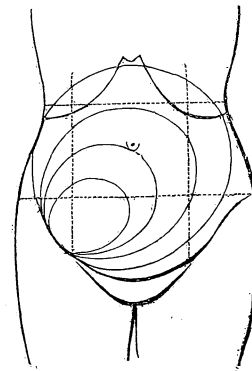

Figure showing the lateral position of ovarian tumours in their earlier stages, as contrasted with the central position assumed in the later stages of their growth.

the patient begins to be aware of its existence—when, I say, the ovarian tumour has come to be of considerable dimensions, then it is very often found to occupy a position in the cavity of

the abdomen, which is at least as central as that of the gravid uterus; and if the patient have not had her attention attracted to the first beginning of the growth, all observation of its position may only serve to lead you astray in your diagnosis. An enlarged ovarian cyst, I repeat, may come to fill up the whole of the abdominal cavity, and to press forward the walls equally on both sides of the mesial line; while on the other hand, you must remember that the gravid uterus is very frequently somewhat lateral; and where this deviation was very distinct, as is not unfrequently the case, the pregnant uterus has been tapped under the impression that it was a dropsical ovary.

2. *Form of the Tumour.*—The tumour may vary in form, but it is usually more or less rounded or spherical. Often its surface feels smooth and equable; but often, also, it is unequal in its form and bossellated on its surface from the projections and protuberances formed by the unequally enlarging cysts. When development has taken place to such an extent that the small cysts have all coalesced to the formation of a single large one, the surface is perfectly regular, and feels as smooth and even to the touch as the surface of the gravid uterus. In those cases also where the tumour is made up of an infinite number of very small cysts filled with a glairy fluid, the surface is very smooth and unbroken. But in the ordinary multilocular ovarian growth you can usually trace on the surface indentations surrounding protuberances of larger or smaller dimensions, and corresponding to the walls of the subsidiary cysts. Sometimes, in its earlier stages, it presents an irregular mass, as if a series of large balls or cysts were tied together within one investing membrane.

3. *Consistence of the Tumour.*—When still small, or when composed of a multitude of separate and distinct cysts, an ovarian tumour feels firm and elastic; but, usually, when a patient comes to consult a Practitioner, it is already soft and fluctuating. The feeling of fluctuation is in most cases quite unmistakeable; but you must bear in mind that when the quantity of liquor amnii is very great the gravid uterus will likewise be felt to give a feeling of fluctuation; and, besides, the elasticity of solid tumours sometimes comes to resemble fluctuation in a most deceptive manner. The colloid tumour of the ovary—that which is made up of many small cysts, and which usually is only elastic to the feel—may sometimes be so soft and fluctuating as to lead you to tap it under the idea that it is formed of one or two large cysts; and even a soft fibroid tumour of the uterus, when infiltrated with fluid, may yield a deceptively fluctuating feeling. Besides, if you lay too much stress on fluctuation as a diagnostic sign of ovarian dropsy, you may sometimes be led into error by mistaking encysted ascitic collections for examples of this disease. In short, the observations I have been making in regard to the physical characteristics of ovarian tumours are only sufficient to guide us to the discovery of a case, without enabling us to recognise it with certainty. A positive diagnosis is only to be arrived at by remembering the various forms of disease with which ovarian growths may be confounded, and by knowing how to distinguish between them; and, therefore, the hints that I have still to offer for your guidance will best be classified under the head of the

DIFFERENTIAL DIAGNOSIS OF THE DISEASE.

There are a great many pathological products, and many physiological conditions of the pelvic and abdominal organs as well, with which ovarian tumours are very liable to be confounded, and for which they are very frequently mistaken. In what I am about to say, however, I shall not enter into a discussion of all the signs and symptoms of these several morbid and functional changes, but must content myself with pointing out in what they differ from ovarian tumours, and by what means the distinction may most readily be made between them.

1. *Retroverted Unimpregnated Uterus.*—When an ovarian tumour is still of small dimensions, and is still contained within the pelvic cavity, one form of disease with which it may readily be confounded is retroversion of the uterus. I have not yet had occasion to direct your attention to the displacements of the womb; but I may so far anticipate my remarks on that subject, as to say that a very frequent kind of displacement is that in which the whole organ is turned backwards, or retroverted, or in which it is bent backwards, upon itself, or retroflexed, so that the fundus comes to lie in the Douglas' space, where it can be felt by the finger

on making a vaginal examination. Unless when bound down by inflammatory adhesions, it is readily moveable in this position; and as the mechanical and functional disturbances which it produces are the same in character and kind as those caused by a small ovarian tumour which has descended into the same situation, it is not always easy by the mere touch of the finger to make a definite distinction between them. The great mark of distinction between the two diseases is that when the body, felt through the posterior portion of the roof, or cul-de-sac, of the vagina, is moved with the finger, a consentaneous movement is produced in the whole uterine organ in the case of retroversion, while the tumour and the uterus are each capable of a distinct degree or amount of independent movement when that tumour is of ovarian origin. If the finger be kept in contact with the cervix uteri, when movement of the doubtful body is attempted to be made, the consentaneous or independent movement of the uterus may usually be easily recognised. But to make sure of your diagnosis you may require to introduce a sound into the cavity of the uterus; and if the case be one of retroversion of that organ, you will find that the sound, instead of passing upwards and forwards, as it always does when the uterus is in its normal position, passes nearly directly backwards, and by simply turning round the instrument after it has been passed in this unusual direction, you can make the supposed tumour disappear, if you should find this step necessary to complete the diagnosis; for by this means the displacement is rectified, and the womb restored to its proper position. On the other hand, if you have to deal with an ovarian tumour, you will find that the sound passes readily upwards and forwards behind the pubis, and when it has been thus introduced into the interior of the uterine cavity, you can use it to fix the womb with perfect certainty, while the tumour remains freely moveable in every direction. Should the retroversion be complicated, as it sometimes is, by the presence of a small fibroid tumour of the uterus, growing from the posterior wall, its fixity when the uterus is fixed and its consentaneous motion when the uterus is moved, will prove its connexion with the organ, and prevent your falling into the error of mistaking it for a small cystic tumour of the ovary, an error which has been often committed.

2. *The Gravid Uterus.*—Perhaps there is no mistake more frequently made in connection with the diagnosis of ovarian tumours than that of confounding them with the enlargement of the uterus consequent on impregnation. Patients have often been suspected and pronounced to be pregnant when they were the subjects of ovarian dropsy; and, on the other hand, the more dangerous error has often been fallen into of supposing the patient to be the subject of so grave a malady when she was merely in an advanced stage of utero-gestation. Many years ago, perhaps thirty or forty, a case of this kind occurred, where a female, with an abdominal tumour, was supposed to be the subject of an ovarian tumour, and where it was decided that the best hope of a successful termination was to be obtained from the operation of ovariectomy. Several gentlemen, who ought perhaps to have known better, saw the case and concurred in their diagnosis, and in their opinion as to the propriety of performing the operation. The day was fixed and everything prepared for the operation, when the patient saved herself all the horrors and dangers of it by giving birth to a baby a few hours beforehand, dispelling most satisfactorily and efficiently the supposed morbid growth. Such an error was more excusable in those days when obstetric auscultation was still unknown, than it would be now that we can have such a certain sign of the existence of a fetus as the sounds discovered by the stethoscope. The sounds of the fetal heart enable us now to recognise a case of pregnancy in the later months, and prevent us from mistaking it for one of ovarian tumour, in which no sound at all is heard on listening with the stethoscope. But even in the use of the stethoscope there is a possible source of error against which you must be warned. The sounds of the fetal heart are usually recognised by the rapidity of the beats, 120 or more in the minute. But when you apply a stethoscope over an abdominal tumour, and hear through it heart-sounds beating at the rate of 120 or 130 times in the minute, you must not immediately decide these sounds to be indubitably of fetal origin, and thence conclude on the existence of pregnancy. The frequency of the pulsations is not always enough. The late Dr. Mcree, of Manchester, once brought a patient for me to see, who had an abdominal tumour, the

nature of which it was rather difficult to determine. From palpation and vaginal examination I had a conviction that the tumour was of ovarian origin, but on listening with the stethoscope we could hear beatings in it between 120 and 130 in the minute. These sounds were very like the pulsations of the foetal heart; but on applying the finger to the patient's pulse at the wrist found her heart to be beating at this same rate of frequency. The sounds were not those of a foetal heart, but of the patient's heart, transmitted through an ovarian tumour. Whenever, therefore, you hear a pulsating sound in the abdominal tumour, however rapid or however slow, you must always carefully determine whether it corresponds or not to the impulse derived from the patient's heart, before you can decide as to its foetal or maternal origin. Other points of difference between ovarian tumours and the gravid uterus have been insisted on, but the great distinction, as I have been saying, is the absence in the former of those foetal heart-sounds which are usually so distinct in the latter; and all other marks of distinction are of such secondary importance that I need hardly enumerate them. The rapidity with which the pregnant uterus enlarges is usually so much greater than is seen in the case of ovarian growths that it may sometimes serve to aid the diagnosis. But in using it you must bear in mind that the ovarian tumour, in some cases grows as rapidly in size as ever the pregnant uterus does. Then, in pregnancy, you have further the placental bruit; and on making a vaginal examination you can produce the movements in the womb which is described as *ballotement*, both of which signs are absent in ovarian growths.

(To be continued.)

ORIGINAL COMMUNICATIONS.

ON PRURITUS PUDENDI MULIEBRIS.

By EDWARD RIGBY, M.D.

IN my previous communication on the subject of Pruritus Pudendi Muliebris (a) I gave the details of a severe case arising from constipation and chylopoietic derangement, and pointed out the frequent connection of pruritus with a rheumatic or gouty condition of the system. The subject is one of considerable interest, not only on account of the great importance of being able to relieve such severe sufferings, but also as regards the different characters which the local affection will assume (although arising from the same constitutional cause), depending chiefly on different states of the circulation, and therefore, as in gout affections, requiring very different and even opposite remedies. The frequent occurrence of Pruritus, in connection with these forms of constitutional derangement, and the numerous modifications which it presents, renders its nature and habits especially worthy of our consideration, and must be my apology for giving the details of some more cases of this character:—

Miss B——, aged 32, brunette, May 2, 1848.—Constant sense of fulness, swelling, flushing, and throbbing of the vagina, with intolerable itching, and occasional pain on sitting down, uterine flatulence, hæmorrhoidal congestion, bowels offensive, urine thick, much gastric derangement, general lassitude. Catamenia regular, is of a rheumatic habit, has had rheumatic fever.

℞ Extr. taraxaci cochl. min. ½ o.n.

℞ Potassæ bicarb., gr. x.; potassæ nitrat., gr. v.; tinct. colchici, ℥xv.; aquæ ʒj. M. ft. haustus bis die post cibum sumendus.

19th.—Writes from the country that she is better in every respect. Rep. taraxacum, o.n.

℞ Pulv. guaiaci, magnesiae, āā gr. x.; o.m.

℞ Potassii iodidi, gr. ij.; liq. potassæ ℥x. ex decoct.; sarzæ co. bis die post cibum. Let her walk before breakfast.

June 14.—Feels much better. Catamenia have appeared twice, quite healthy. All internal flushing and irritation have ceased, bowels confined. Has left off her medicine for the last few days.

℞ Pil. hydr. extr. colocynth. comp. ext. hyosc. āā ʒj. M. ft. pil. xij. sumat ij. h. s. p. r. n. Rep. mistura.

(a) Vol. XXXIX, page 4.

Oct. 28, 1851.—Has had another attack of rheumatic fever two years ago with pericarditis; since which has enjoyed tolerable health till lately, when the vaginal flushing and throbbing returned, with a slight amount of uterine flatulence; has been regulating the bowels by the pills and guaiacum powders. Urine thick, catamenia regular, except that at the last period the discharge was discoloured and somewhat clotted; must take more exercise. Rep. pil. pulv. and mist. potassæ bicarb. and nitr.

Nov. 5, 1852.—Has been pretty well till lately, when having overtaxed her strength in nursing a sick relative day and night for a fortnight, her former symptoms have returned. Rheumatic pains of left arm, and so much vaginal flushing and swelling that she can scarcely sit down; much flatulence, bowels latterly have been confined, frequent profuse perspirations with a strong disagreeable odour. Catamenia regular.

℞ Acidi hydrochlor. dil., acidi nitrici dil. āā ʒj.; liq. taraxaci, ʒj.; infusi aurantii co. ʒvij. M. Rep. pil. hydr. coloc. and hyosc.

℞ Sodæ potassio-tart., primo mane p. r. n.

10th.—Writes that her general health is improved, but that the irritation is very distressing. Rep. med., lotio plumbi c. decoct. papaveris.

Dec. 15.—Pruritus very troublesome; says that there is a hard lump inside one of the labia, which swells and becomes purple at the catamenial periods and before an attack of the pruritus, when the whole vagina is intensely congested; the pulse is feeble, and she finds that the irritation is relieved by taking a glass of wine at these times.

℞ Acid. nitro-mur. c. liq. taraxaci ex infuso cinchonæ cordifol. bis die.

℞ Hydrarg. nitrico-oxydi, ol. jecoris aselli āā ʒj. M. ft. linimentum inter labia applicandum.

Date omitted, but early in 1853.—States that her general health is good, but that the local irritation and inflammation are much increased.

Examination per Vaginam.—Os externum intensely tender; os uteri natural. ℞ Sodæ biberatis, ʒj.; vini colchici, ʒss.; decoct. papaveris, ʒvijss. M. ft. lotio.

October 5, 1855.—For two years and a-half has been completely relieved by the above lotion until lately; returns with much general gastric derangement; unhealthy bowels; cold extremities; great flatulence; a clammy, damp state of skin, etc.; a slight return of the pruritus. Pil. hydr., extr. coloc. co., extr. hyosc. āā ʒj. M. ft. pil. xij., sumat ij. alt. noctibus, acidi nitro-mur., liq. taraxaci ex. infus. aurantii co. bis die ante cibum. ℞. Potassæ bicarb. gr. x., potassæ nitr. gr. v., post cibum. Rep. lotio colchici.

August 8, 1857.—Has had a slight return of the pruritus before and after the catamenial period; leucorrhœa; pulse feeble; tongue pale, indented; face sallow; has alternate chills and flushings; urine very high-coloured; says that the bowels are regular. Rep. pilulæ. ℞. Pulv. guaiaci, magnesiae, āā gr. x., o. m. ℞ Potassæ bicarb. ʒiv.; potassæ nitr. ʒij.; sp. ætheris nitr. ʒss.; aquæ ʒvijss. M. ft. mist. sumat cochl. magna ij., bis terve die post cibum.

September 5.—Writes that the pruritus is troublesome, especially at night; leucorrhœa; says that she is "bilious." ℞ Pil. hydrarg. extr. hyosc., āā ʒj.; M. ft. pil. viij., sumat ij. alt. noctibus. ℞ liq. potassæ, flʒiv.; potassii iodidi gr. xvj., liq. taraxaci ʒj.; decoct. sarzæ co. ʒvij. M. ft. mist. sumat cochl. magna ij. bis die post cibum.

23rd.—Health improved, but complexion still dusky; tongue pale; pruritus has diminished; has been suffering from a boil in the vagina. Nitro-mur. acid c. liq. taraxaci ex infuso cinchonæ oblongifoliae, bis die ante cibum. ℞. Ferri sulph. gr. ij.; magnesiae sulph. ʒj.; acidi sulph. dil. mʒij.; syrupi rhœados, ʒss.; aquæ menthæ pip. ʒvijss. M. ft. haustus primo mane sumendus; applicetur glycerina vulvæ.

October 23.—Great local discomfort; much vaginal swelling, heat, and soreness; at times the vagina is so swollen as to induce an inclination to bear down; tongue very pale; pulse feeble. Mist. ferri. citratis effervesce. Rep. lotio sodæ biberat. c. vino colchici.

November 21.—Much relieved by the lotion. Rep. mist. and lotio. Pil. Plummeri, gr. v. in septimanâ, let her apply some glycerine after using the lotion.

The above is a severe case of pruritus very distinctly connected with a rheumatic, or rheumatic-gouty condition of the system, as is not only shown by her rheumatic habit, her former rheumatic fever, hæmorrhoidal congestion, and disposi-

tion to gastro-enteric derangement, but also by the relief produced by those remedies which are known to give relief under such conditions of the system. After a preliminary treatment for two or three weeks with taraxacum and salines, with colchicum to rectify the deranged state of the chylopoietic functions. I ventured to attack the pervading taint of her system in a more decided manner, with a course of liq. potassæ, and potassii iodidi in decoct. sarzæ co., keeping up a moderate action on the liver by means of taraxacum, and regulating the bowels by Dr. Prout's well-known combination of guaiacum and magnesia, which is so valuable in these atonic cases. I did not see her again for more than three years; in about a year after she had ceased to call upon me, she experienced another outbreak of rheumatic fever, which appears to have relieved the system, and enabled her to enjoy tolerable health for two years, until October, 1851, when she again began to suffer from vaginal irritation, etc. The rheumatic-gouty nature of the local affection was now still further indicated by that remarkable symptom, uterine flatulence, which I hold to be a certain diagnostic of this condition when it occurs, and which I have found to be a valuable guide in these and other complicated cases depending upon, or connected with, this general taint of the system. She returned to the same course of treatment, and continued in tolerable health and freedom from her annoyance for more than a year; when, in consequence of prolonged over-exertion in nursing a relative, the symptoms returned. Besides well-marked rheumatism of the left arm, and considerable gastro-enteric derangement, the vaginal congestion was so severe as to almost prevent her sitting down, having probably been much aggravated by being constantly on her legs for a fortnight. Her powers were much reduced, and this, coupled with the frequent profuse and unhealthy perspirations, appeared to contra-indicate her previous treatment, and require the use of the nitro-muriatic acid with a mild tonic.

It is curious to observe how the effects of salines appear to depend on a certain amount of vigour in the system. As long as the pulse is tolerably strong, they agree with the stomach, neutralise the acid urine, and relieve the patient; but if the pulse is feeble they give no relief, and have no effect in removing the sediment of lithate of ammonia; whereas the urine will now become clear under the use of nitro-muriatic acid, combined with some light tonic.

Under this treatment the general health rapidly improved, but her local sufferings experienced little if any abatement. A lotion of Goulard and poppy decoction failed to relieve her, and the health began again to suffer; her debility had increased, and the engorgement of the vulva at times was worse than ever. Guided by the fact that a glass of wine mitigated the severity of these attacks, I now prescribed an infusion of yellow bark with the nitro-muriatic acid, and reasoning on her feeble condition, I ventured to try the liniment of red precipitate and cod-liver oil, for which I am indebted to my late friend, Dr. Girgens, of Wiesbaden. In this I erred sadly, for experience had hitherto told me that this application was successful only in that form of pruritus where the part affected is pale and relaxed—the tonic agreed well, but the local application made matters worse; and, finding her strength improved, I returned to the lotion of borax and colchicum, which had given her on former occasions so much relief. For two years and a-half she kept free from her enemy; but, again failing in health, it returned, and gradually assumed a greater degree of severity than ever. A similar plan of treatment was adopted, and again the application of the lotion was attended with complete relief.

36, Berkeley-square.

MOVEABLE KIDNEY IN CONNEXION WITH SPINAL DISEASE.

By WILLIAM HENDERSON, M.D.

Physician to the Clifton Dispensary, etc., and formerly House-Surgeon to St. Bartholomew's Hospital.

IN addition to the cases of moveable kidney already recorded by Rayer, Oppolzer, Dr. Hare, Hennoch, Dr. George Johnson, etc.—in all, I think, about thirty cases—I wish to publish the following, as there are some points of especial interest attached to it, and which were elucidated by a post-mortem examination.

On July 10, 1858, I was consulted by Mrs. —, aged 51, on account of a tumour in the abdomen, which she said she had observed for a long time, but she could not say exactly when she first noticed it; and, as it caused her no pain nor inconvenience, she had not paid much attention to it.

On examination I found a solid tumour situated in the right hypochondriac region, and which could be easily moved towards, and to within an inch of, the umbilicus; on slight pressure the tumour would disappear under the liver, and there remain imperceptible until by an effort of bearing down the patient caused it to again protrude. It appeared to resemble a healthy kidney in form and size, and was not in the slightest degree painful, even when freely handled. Her digestive organs were not in any way affected, and she passed a normal amount of healthy urine, which was not increased after free examination of the tumour.

She had curvature of the spine caused by disease of the bodies of the fifth and sixth dorsal vertebræ, which had commenced four years ago; but reparation had apparently taken place, for she could now move about with ease, and had performed her ordinary domestic duties for two years without much inconvenience. She was the mother of four children, the youngest being ten years old. Her menstruation had always been regular. As the tumour, which I conceived to be a moveable kidney, caused no inconvenience, and as she was in good health, I did not then prescribe any treatment.

On August 19 I was summoned to see her, when I found her suffering from pleuro-pneumonia; she complained of great pain in the region of the diseased vertebræ, and declared that she could feel the bones grate when she tried to turn in bed, and when she coughed; she complained also of shooting pains extending round the abdomen. After five days she expectorated about four ounces of very fetid pus, and after that she gradually improved under treatment by counter-irritation, a generous diet, with a free allowance of wine, and small doses of dilute phosphoric acid, being, of course, kept at perfect rest, and by the middle of October she could again get about by wearing an apparatus; but she still complained of the shooting pains occasionally passing through the abdomen, and which she referred to the tumour. These pains being entirely distinct from the constant pain caused by the diseased vertebræ, I was at that time led to suppose the tumour to be of a malignant nature, and probably connected with the mesentery or omentum. She continued in much the same state, and occasionally expectorating fetid matter, until June 12, 1859, when she had a severe attack of hæmorrhoids, attended by intense pain; these, however, disappeared under treatment by application of ice, etc.

The tumour at this time could not be discovered; and any effort on her part to cause it to protrude was attended by the same shooting pain passing through the abdomen. I now felt convinced that the tumour was malignant, especially as she had that anxious expression of countenance so peculiar to those suffering from malignant disease.

The grating sensation of the spine, and occasional expectation of fetid pus, still continued, but there was not the slightest symptom of paralysis; the appetite continued good, and the digestive organs in perfect order. On September 6, she again had a severe attack of pleuro-pneumonia, with intense pain in the back, and under this she gradually sank and died on October 25, 1859. The day before her death there was anasarca of the right leg, but no diminution of the power of sensation, nor any sign of paralysis. She died rather suddenly, having at five p.m. declared that something had burst in her abdomen, and in half-an-hour she was dead.

Post-mortem, twenty hours after death.—The right lung was firmly adherent to the parietes of the chest to its whole extent, and the pleura had the appearance of a sheet of parchment; round the diseased bone there was a very firm band of adhesion, which enclosed a cavity containing fetid fluid, and several spicula of bone. The lung round this spot was consolidated, but all the other parts were pervious to air. There was no tubercular disease; the left lung was firmly adherent, but not consolidated; the pericardium contained about an ounce of fluid; the heart was healthy; the bodies of the fifth and sixth dorsal vertebræ were so far gone, as to leave an open space by which the two fingers could be passed into the spinal canal.

On examining the abdomen, the right kidney was found to be perfectly moveable, and was suspended, as it were, by a prolongation of the peritoneum enclosing the kidney, and

forming a distinct mesentery, which allowed it to be moved in all directions. Both in size and structure the kidney was perfectly healthy. The left kidney was loosely attached, but not moveable from its position. The liver was smaller than natural, but not apparently diseased; all the other abdominal organs appeared perfectly healthy and normal, and there was no appearance of any malignant disease.

It is curious that, with such extensive spinal disorganisation, there was not at any time the slightest symptom of paralysis, and that the digestive organs performed their functions so perfectly; the moveable kidney I conceive to have been a congenital affection, as the mesentery which held it was perfect, and the vessels were greatly lengthened; it is singular, however, that it had never been noticed at the time of her different confinements.

The disease of the spine was so far above the ordinary position of the kidney, that it does not appear to have been the cause of the latter being moved; indeed, she had observed the tumour before the spinal disease commenced. What could have caused the sensation of something bursting in the abdomen just before death I cannot conceive; the shooting pains, which induced the belief that the tumour was malignant, must have been caused by the spinal disease.

Clifton, Bristol.

DIFFICULTY OF DELIVERY IN RUPTURE OF THE UTERUS.

By J. H. AVELING, M.D.

Fellow of the Obstetrical Society of London, and Hon. Member of the Obstetrical Societies of Edinburgh and Dublin.

THE cases to which I wish to call the attention of the reader in this paper, are those in which either the body or the fundus of the uterus has become ruptured, and in which either one or both of the child's legs have escaped into the abdominal cavity.

Dr. Dewees, in the treatment of these cases, where the child is only partially protruded into the abdominal cavity, says that "pains may effect the delivery of the child, or it may be readily extracted by art." But how different is the pleasant reading of a fluently-written work on Midwifery, to the painful practice of it with a suffering patient before you, and alarmed faces around! That the child may be readily extracted when the rent extends to the vagina, I do not deny; but, if the rupture be situated in the fundus or body of the uterus, great difficulty may be expected frequently to be met with.

In support of this statement, I shall quote two cases, the first of which Mr. James Baron, of Gosforth, has the credit of having given to the Profession in the *Medical Times and Gazette*, December 3, 1853.

Case 1.—The woman, aged 38, was in her twelfth labour, which proving to be lingering, two doses of ergot were given. About an hour and a-half after, the head was found bearing well down towards the perineum, when the patient became violently excited, and cried out that "the pain was dreadful, of an intense burning character, which never left her, and which she could not live under." After an ineffectual attempt to restrain her, she got out of bed, but scarcely had she done so when she was observed to become deathly pale, and she said, quite calmly, "I feel very waffish." Rupture of the uterus was at once suspected, and after some delay, caused by having to send for his instruments, Mr. Baron proceeded to deliver. After a little difficulty in locking his forceps, Mr. Baron began to extract. But I will here use his own words:—"Immediately on doing so (extracting) she commenced to complain of the 'burning' pain, and, as I proceeded, she became excited in the same violent way as before; but having more help, we restrained her. In about half-an-hour, after much labour, I succeeded in delivering the head, but, as I did so, she expired. The shoulders defied all my efforts to extricate them, and I was obliged to be content, and allow the child to remain. It showed no symptoms of life."

At the post-mortem examination, immediately on cutting into the abdomen, the breech and legs of the child, together with the placenta, were found lying in the peritoneal cavity. The contracted uterus was found low down in the left iliac region, hid from sight by the intestines. The rent was exten-

sive, and situated in the anterior wall; but whether it was continued through the os tincæ could not be ascertained, as the child occupied the entire pelvis, and could not be moved.

Case 2.—I received a note in the middle of the night from a Practitioner in the country, saying that he had met with a difficulty, and would be glad if I would come directly. On arriving, I found two Medical men in the house, and the patient, a fine dark, handsome woman, of about 30 years of age, in a very weak state, with an anxious, dusky countenance, and suffering from violent and rapid pains. The arm had presented, and my Medical friend had succeeded in bringing down the left foot, with the intention of turning. No amount of traction, however, on this foot produced any other effect than that of causing the patient intense agony and violent contractions of the uterus. Hoping to relax the uterus, I put the patient under chloroform, but with no effect, for the uterus continued as firmly contracted as ever, and the fœtus remained as immovable. A dose of opium was given, hoping that the spasmodic character of the pains would abate, but the patient sank rapidly, and died undelivered.

On examining the body the next day the whole of the right lower extremity of the child was found protruding through a rent in the uterus into the abdominal cavity. The rupture had taken place in the anterior and upper part of the body of the uterus, and was not large enough to allow the child to be drawn through it without being enlarged by the knife. Very little hæmorrhage had taken place. The child was a fine healthy male.

The great question which arises after reading these two cases must be with everyone, What was the cause of the difficulty in delivering? And the answer to this question, as far as my reading goes, is not to be found in any work on Midwifery. If the reader will recal to his mind the position of the fœtus in the uterus, and more especially the manner in which its thighs are firmly flexed upon the abdomen, he will have no difficulty in understanding how one or both of these flexed thighs may, when protruded through the walls of the uterus, become hooked over the edge of the ruptured opening, and thus defy any effort to extract the child short of that which would be sufficient to bring the uterus with it.

In Mr. Baron's case, the same "burning" pain and violent excitement was produced when he began to extract with the forceps, as had occurred at the time of the rupture. These were, doubtless, caused by the strain upon the edges of the rent caused by the body of the child, and the two thighs hooked over, being pulled downwards. At the post-mortem the uterus was found low down in the iliac region. This is exactly the position, supposing the child to have presented naturally, in which one would have expected to have found it: for the legs of the child would naturally incline to the right, and being protruded from the uterus, would occupy the right side of the abdominal space. Mr. Baron attributed the difficulty of delivery to the shoulders of the child; but, at all events, in Case 2, such could not have been the cause.

Treatment.—Baudelocque, in the treatment of these cases, says:—"When the head presents after the rupture of the uterus, even if it should not be engaged in the pelvis, provided the deformity of the latter does not offer any great obstacles to it, we ought to terminate the delivery with the forceps—whatever part may have penetrated into the abdomen. We ought not to extract the child by the feet, but when they are found in the neighbourhood of the orifice of the uterus; or when the child is still entirely in that viscus."

Dr. Collins says,—"When the head presents and does not recede, it is rarely that lessening it and delivering with the crochet will not be found the most eligible mode of proceeding. Efforts have been frequently made to deliver with the forceps in such cases; but this instrument is seldom applicable, as the introduction of the blades generally forces the head out of our reach; besides, but little would be thus gained, for the child dies shortly after the rupture takes place."

Dr. Burns, in the treatment of these cases, says,—"Delivery by turning the child, has advantages over the other modes, and certainly ought, with scarcely any exception, to be resorted to. When the uterus is spasmodically and violently contracted between the rent and the os uteri, which I know is apt to happen if the fundus be lacerated, I consider attempts to deliver as adding to the danger." In Case 2, therefore, he would have done nothing.

Madame Boivin says,—"Sila tête est engagée dans l'excava-

tion, il faut l'extraire avec les forceps. Si la tête n'était point susceptible d'être saisie avec l'instrument, il faudrait faire l'extraction de l'enfant par les pieds; si ces extrémités étaient passées par la crevasse de l'utérus, il faudrait y faire pénétrer la main pour les ramener dans la cavité utérine et les extraire par l'orifice naturel."

So almost universally fatal are these cases that many authors have advised that they should be left to Nature, some patients having recovered when so treated. They have been, perhaps, led to this conclusion, partly from the humane feeling that the few remaining minutes of the patient's life ought not to be embittered by the agony which any attempt at delivery would be sure to produce. But these feelings must be allowed to have no weight with us when we know that any little chance a woman may have is greatly decreased by her remaining undelivered. Out of thirty-four cases reported by Dr. Collins, two recovered. Who can tell, when he has the misfortune to meet with a case of ruptured uterus, that the patient under his care may not be one of the few who, if properly delivered, may again be restored to health? It is our duty, therefore, to consider no case as hopeless, and to continue to exercise, while life remains, our utmost skill. The question left then is:—

What is the Best Treatment in these Cases?

(a) All modern writers are pretty generally agreed that in cases of rupture of the uterus the child speedily dies. Unless, therefore, delivery be rapidly completed, the child must necessarily be sacrificed. The knowledge of this is of great importance, for we might sometimes be induced to adopt modes of delivery both more painful to the mother and more difficult to the attendant, if we thought there was any likelihood of saving the child.

(b) If rupture of the uterus takes place during the presence of the Medical attendant, and be at once recognised, turning, if practicable, should at once be accomplished—unless

(c) The head be so nearly born that the forceps can be readily applied, and the labour to all appearances be easily terminated. In this case the forceps should certainly be used, for as the laceration usually takes place at the junction of the uterus with the vagina, the obstacle to delivery, which it has been the object of this paper to demonstrate, would in a large proportion of cases not exist. The patient should have the benefit of our knowledge on this point, for if we attempted to push back the head for the purpose of turning we might either increase the extent of the laceration or cause the child to be protruded still further into the abdominal cavity.

(d) If at the time of the rupture the head of the child is firmly fixed in the pelvis, and does not recede before the hand, turning in such a case would be madness. The child must be considered doomed, and the treatment recommended by Dr. Collins would be the best to adopt. The head should be lessened and the child brought away by the crotchet.

(e) But if, after lessening the head, delivery be still impracticable, the thighs of the child will then be found most likely to be hooked over the edge of the rupture, and in this case the treatment of Madame Boivin would be best. The hand must be introduced into the uterus, and the extremity or extremities of the child must be withdrawn from the abdominal cavity into the uterus and the child extracted by the feet. Case 2 shows how necessary it is to secure both feet.

(f) If at the time of the rupture the head recedes so as to make it difficult to operate upon it, it will be better to turn at once, and to secure both extremities as above.

(g) If the arm presents, as in Case 2, it will be best to lessen the thorax and to bring down the hips. If it be found from the difficulty in extracting, or from external examination, that the thighs were hooked through the uterus, the operation will still have been of service, for the hand will be more easily passed for the purpose of securing the extremities and turning as above.

(h) Whatever mode of treatment is adopted, it will be found worse than useless to drag away at the child while one or more of its thighs are hooked over the edge of any laceration of the uterus not extending into the vagina.

THE EMPEROR OF THE FRENCH has presented a gold snuff-box to Dr. Kenny, of Hong Kong, for services rendered to the French Mission in China.

THE LONDON PRACTICE OF MEDICINE AND SURGERY.

THE LONDON HOSPITAL.

DELIRIUM TREMENS OCCURRING AFTER FRACTURE—DEATH DURING THE ADMINISTRATION OF CHLOROFORM.

J. P., aged 57, was admitted into the London Hospital on November 5, for fracture of the tibia and fibula. The fracture extended into the knee-joint. He was a waiter at a low public-house, and suffered the injury by falling through a trapdoorway. He was immediately taken to the Hospital, and the limb placed in a swing apparatus. He was a stout, not flabby, muscular man, and apparently vigorous, although it was ascertained that he was very intemperate, and was accustomed to drink largely of gin (half-a-pint before breakfast).

The next day symptoms of delirium tremens set in. His usual stimulants and nutritious diet, etc., were freely supplied, but the delirium increased. He also took forty drops of tincture of opium on two occasions, but without any apparent benefit. An attempt was made to examine the heart, but from its extremely rapid action, and from his great restlessness, it was impossible to come to any conclusion.

Early on the morning of Tuesday, the 7th he became furious, shouting and raving, and trying to get out of bed. Mr. Braden (House-Surgeon) was called to him, and, with the assistance of Mr. Griffiths, attempted to administer chloroform. About half-a-drachm was placed on a little lint, and with difficulty was kept applied. After no more than three inspirations, however, the man "writhed," and fell back dead. Very little of the chloroform could have been given, as, independently of the short time the man respired, there was necessarily the greater portion lost by his struggling.

The autopsy was performed next day by Mr. Braden. No disease whatever was found anywhere, except some slight deposit on the tricuspid and mitral valves, not sufficient to cause any symptoms during life. The brain was apparently quite healthy. The fracture was found, as stated, to extend into the knee-joint.

ST. BARTHOLOMEW'S HOSPITAL.

RETENTION OF URINE IN A CHILD —DEATH—EXTENSIVE TUBERCULOSIS OF THE GENTO-URINARY ORGANS.

(Under the care of Mr. WORMALD.)

A very instructive case has recently occurred under Mr. Wormald's care, in which symptoms of urinary disease in a young child were exceedingly difficult of interpretation. Pathologically, as well as practically, the case is also well worthy of attention, inasmuch as the conditions found at the autopsy were such as are but very rarely seen, more especially at so early an age.

An emaciated child, aged 9, but looking more like 6, was brought to the out-patients' room, complaining of pain in the lower part of the abdomen. Mr. Wormald remarked to the students that the child had an aspect as if it were suffering from phthisis, and prescribed accordingly. This was on a Monday. On the following Thursday the child was much worse, and his mother stated that he had much difficulty in making water. It was now ascertained that the bladder was distended, and also that there was a circumscribed effusion of urine into the perineum. It appeared on inquiry that the retention had been incomplete, and that there had been some dribbling away. Mr. Wormald at once admitted the child into the Hospital, and made an incision into the perineal effusion. An instrument was passed with great care into the bladder, and that viscus was emptied. No stone was felt, nor any impediment whatever encountered. The cause of the retention of urine and of the urinary abscess were exceedingly obscure. The child appeared at first relieved, but subsequently fell off, and, having gradually lost strength, died about three weeks after his admission. It should be stated that he had not suffered any very great degree of pain while under observation, nor was he particularly restless or fretful.

The autopsy gave a very complete explanation of the symptoms which his case had presented. Both kidneys were found totally disorganised by the deposit of masses of tubercle. The ureters were filled with tuberculous matter, and the prostate, which was enlarged, was riddled throughout by tuberculous abscesses. Beneath the mucous membrane of the bladder there were also deposits of tubercle. A little anterior to the bulb was an abscess cavity into which the urine had been extravasated, and which had evidently originated from the giving way into the urethra of a sub-mucous collection of tubercle. In addition to this extensive disease of the genito-urinary apparatus, tubercles were also found in both lungs and in the mesenteric glands. The retention of urine had in all probability been caused by the pressure of the tuberculous collection under the track of the urethra prior to its giving way.

SYMPTOMS OF STONE—PASSAGE OF CALCULOUS MATTER—DEATH—CALCULOUS CONCRETION LINING THE INTERIOR OF BLADDER.

(Under the care of Mr. WORMALD.)

A lad, aged 19, was sent up from the country to be placed under Mr. Wormald's care for what was supposed to be stone in the bladder. His symptoms had existed for about a year, and although somewhat emaciated he was not very ill. The condition of his urine was very peculiar, as it contained a deposit which much resembled mortar. He had repeatedly suffered from retention, which after lasting for a time, would be relieved on the expulsion of a softish mass of mortar-like concretion. Mr. Wormald attempted to introduce an instrument, but could not get it into the bladder. During the attempt a large quantity of glairy mucus escaped, and the discharge continued for some time afterwards. Mineral acids with opiates were prescribed, but the lad continued to suffer severely and failed in general health. On a subsequent occasion Mr. Wormald succeeded in introducing an instrument and ascertained the presence of a large quantity of calculous matter in the bladder. Wherever the point of the instrument was turned this concrete matter was felt, but no where did it give to the finger the impression of hardness and density usually afforded by a stone. A consultation was held on the lad's case, when Mr. Wormald stated that he was not inclined to submit the lad to lithotomy believing that the whole interior of the bladder was diseased, and that there was no isolated calculus. This opinion, as the result proved, was a well founded one. The lad got gradually worse, and after the lapse of some weeks died.

At the autopsy the whole lining membrane of the bladder was found concealed by a thick crust of concretion, which looked exactly as if mortar had been plastered on. Both kidneys were tuberculous, and the urethra was extensively ulcerated, apparently from the irritation of impacted masses of calculous matter.

MALIGNANT DISEASE OF THE TESTIS WITH MASKED SYMPTOMS—EXCISION.—RECOVERY.

(Under the care of Mr. STANLEY.)

About five weeks ago, among the operations at St. Bartholomew's Hospital, was one on a case of diseased testis, which presented features of unusual interest. The patient was a somewhat cachectic man, aged 24, and by trade a blacksmith. When placed on the table, the right side of his scrotum was seen to be distended by a swelling larger than an adult fist. The integuments were adherent, and of a dusky red colour. In one part it appeared as if pointing were about to take place, and pseudo-fluctuation was present. The cord in its lower part was somewhat thickened, but higher up was quite healthy. The left testis was normal in all respects. Mr. Stanley gave the following history of the case:—He stated that he had not yet been able to make any positive diagnosis as to the nature of the disease. Whether the tumour was an inflamed hæmatocele, an abscess in the testis, or medullary cancer, he was still in doubt. The proposed operation would, therefore, be one of exploration, and its ultimate extent would be determined by the condition reached by the first incision. The man had stated that his testicle had only been enlarged for about eight weeks, before admission (he had been in the Hospital six weeks). Not long before the enlargement was first noticed, he had received a blow on the part from the handle of his hammer. This

pointed to hæmatocele; but against such diagnosis was the fact that the swelling had increased gradually, and had not formed suddenly after the blow. The increase in size, both prior to and since the man's admission to the Hospital, had been attended by considerable pain, and there had also been aching in the back and loss of flesh. No positive history of cancer in the patient's family had been made out, but one of his aunts had died from "tumour in the side."

The Operation.—The man having been rendered insensible by chloroform, Mr. Stanley made a long and free incision into the front of the tumour. This opened a cavity, which most took for that of the tunica vaginalis, and from which Mr. Stanley turned out with his finger nearly a tea-cup-full of softish material, somewhat resembling decolorised blood clot. In this material, however, were small portions which were evidently organised, and which looked like medullary cancer. Mr. Savory, to whom the parts were handed for minute examination, gave a confident opinion on this point. Mr. Stanley accordingly removed the testis in the usual way. After its removal it was found that the large cavity which had been supposed to be that of the tunica vaginalis, was in reality that of the distended tunica albuginea. The latter tunic had been freely laid open by the knife, and the whole of the gland, which had been converted into soft medullary cancer, had been scooped out by the finger. Not a trace of normal testis-structure remained, but the condition of things was most deceptive, and unless a careful examination of the removed material had been made it might easily have been supposed that the cavity was that of an inflamed hæmatocele. The medullary material had in most parts undergone the change known as "saponification of cancer," thus being converted into an opaque material very dissimilar from its original and typical state, and closely resembling altered blood clot. To make the deception still greater there was at the posterior part of the cavity a mass of firmer structure, connected with the epididymis, which closely resembled, both in position and form, a testis in the cavity of an inflamed hæmatocele. It should be stated that the opinion given at the time of the operation, as to the malignant nature of the disease, was afterwards fully confirmed by microscopic examination.

Subsequent Progress.—Since the operation, the man has done well in every respect; he has been free from pain in the groin, and has had less of aching in the loin. The wound is now, after the lapse of five weeks, just healed. He has already gained flesh, and is of clearer complexion.

LARGE FIBROID AND FIBRO-PLASTIC TUMOUR CONNECTED WITH THE FEMUR.—AMPUTATION.

(Under the care of Mr. STANLEY.)

A fairly healthy young woman, aged 26, was brought into the operating theatre on Saturday last, to have her thigh amputated on account of a large tumour surrounding the lower third of her right femur. She had known of its existence for five years; she had experienced but little pain during its growth, and had not materially suffered in her general health. The tumour was irregular and bossy in outline, and was developed both before and behind in the shaft of the bone. The inguinal glands were not enlarged, nor were there any indications of internal disease. Mr. Stanley stated that the history and present symptoms both inclined him to the opinion that the tumour was not malignant. He proposed, therefore, to amputate not at the hip-joint, but through the upper third of the bone.

The patient having been put under the influence of chloroform, the limb was removed in the usual manner, and with but little loss of blood. Some suspicions being entertained as to the condition of the medulla at the point of section of the bone, another inch of its shaft was subsequently sawn away.

On examination, the tumour, which in its whole bulk was little less than an adult head, was seen to be of a firm fibroid structure. It involved the shaft of the lower third of the bone, and extended down into its condyles. At the upper part some large bossy out-growths appeared to have been developed between the periosteum and the shaft. The knee-joint was healthy, and the muscles, etc., overlying the tumour were in their normal state, there being no tendency to the infiltration of adjacent parts. In the middle of the tumour, that is, in the parts nearest to the interior of the bony shaft, were portions of soft structure, and of yellow or reddish colour, closely resembling myeloid. Portions of deposit of the

same fluid were also seen in the medullary cavity of the shaft for several inches above the tumour.

There could be little doubt that in this case the tumour was of mixed fibrous and fibro-plastic elements. The history of its comparatively slow growth corresponded with this character, and so in all probability will its future progress. Its myeloid elements were evidently very limited in extent, and nowhere was there any structure which resembled true cerebriiform cancer. If called upon to decide as to the malignancy or non-malignancy of such a growth, the answer ought to be, that the question is one of degree more than of kind. As compared with a typical specimen of myeloid, or of enchondroma, it is probably malignant, that is, the risks of its return are much greater; but if contrasted in regard to the same points with medullary cancer of bone, then it is innocent. The Hibernian verdict of "Guilty, but not much," might be said to be fairly applicable to it.

On Thursday last, November 16, she was reported as doing well in every respect.

**POPLITEAL ANEURISM.—LIGATURE.—
SECONDARY HÆMORRHAGE. — DEATH.—
AUTOPSY.**

(Under the care of Mr. PAGET.)

W. N., aged 30, was admitted into Darker Ward, in St. Bartholomew's Hospital, under the care of Mr. Paget, June 13, 1859.

June 13.—Is a sparely-nourished man of temperate habits. He has been actively engaged as a cheesemonger up to the time of his admission. He states that five weeks previously he first noticed a swelling in the left popliteal space, which has not since increased in size, and has caused him no inconvenience except a slight feeling of stiffness in that leg. This tumour, about the size of a hen's egg, is situated just below the bend of the knee, between the two heads of the gastrocnemius, is soft, and has the pulsating character of an aneurism. The femoral arteries on both sides are remarkably large, compared with the radial, which are small; the posterior tibial artery on the left side cannot be felt, but the anterior pulsates strongly. There is some slight œdema of the left leg. His tongue is clean; pulse good, about seventy per minute. There is no evidence of any other disease, and he has always previously been in good health.

15th.—The circumference of the tumour, measured at the most prominent part, is 14½ inches.

20th.—It having been determined to treat the case by flexion, the leg and thigh were to-day rolled, and the knee bent nearly to a right angle. This occasioned him no inconvenience, and stopped all pulsation in the anterior tibial artery.

23rd.—The bandage becoming loose in the night after it was first applied, it was replaced on the 21st, but has been removed to-day, as he complains of its feeling painfully tight. The whole leg is much more œdematous, and warmer than the right. The tumour now extends about three inches down the calf, pulsation in it is much less evident, and none can be felt in the arteries below it. The circumference of the leg measured at the point before mentioned, is now 15½ inches. His general health seems unaffected, his pulse scarcely more frequent than natural; tongue clean; appetite good, etc.

At a consultation of some of the Surgeons of the Hospital, the conclusions arrived at were either that the sac of the aneurism had given way, or that inflammation of the sac, and the parts around it, had set in. Mr. Lawrence held the former opinion, and advised the immediate ligature of the femoral artery. Mr. Paget the latter, and fearing lest that operation should be followed by gangrene of the leg, thought it best to postpone it for a few days, and ordered his leg to be raised, and kept cold with Goulard's lotion, and changed his diet from meat to broth.

28th.—His condition has not much changed. The circumference of the leg at the same point as before, now measures 16½ inches; the tumour, too, extends rather lower down the calf of the leg, and is harder than before. Mr. Paget to-day tied the femoral artery in Scarpa's triangle, and all pulsation in the aneurism has since ceased.

July 8th.—Has not had a bad symptom since the operation; the ligature has come away to-day; only a small part of the wound at the lower end has healed, the remainder is suppurating healthily. The œdema of the leg has much decreased, but the tumour is but little changed. Ordered a mutton-chop daily.

16th.—The wound healing very slowly, and the granulations looking pale, it was ordered to be dressed with a weak solution of sulphate of zinc, and he is to have four ounces of wine daily.

August 6.—The wound has not yet healed, and he progresses but slowly, though his general health is good. The tumour is rather smaller, and has a feeling of fluctuation. The œdema has almost entirely subsided; the skin to a small extent has sloughed at two points at the outer side of the leg where it rested on the bed. Ordered full meat diet, and a pint of porter daily.

13th.—As the wound had nearly healed, but had a very unhealthy appearance, he was to have left the Hospital to-day; but, after walking down stairs, he observed some blood trickling down his leg on the pavement, he was therefore at once carried back to his bed. The quantity of blood lost was rather more than an ounce, and appeared to come from the upper end of the wound, close above which the femoral artery could be felt pulsating strongly. He is to take sulphate of iron and quinine, of each one grain three times a-day, and six ounces of wine, in addition to his pint of porter daily.

23rd.—There has been no recurrence of the bleeding, the wound still looks very unhealthy, and scarcely progresses at all, and he has to-day been carefully removed to his home at Twickenham.

Sept. 3, 8 p.m.—Is again brought to the Hospital, with the account that the wound was quite healed on the 1st, when while walking from one room to another, the cicatrix gave way, and he lost a large quantity of blood. This morning again there was a sudden and profuse hæmorrhage from the wound, which was scarcely restrained by a tourniquet. He is perfectly conscious, and his manner is quite natural. His skin is cold, and no pulse can be felt at the wrist, and his stomach rejects all food and stimulants. The cicatrix seems to have given way in its whole extent, and the wound is filled with a large clot. Thinking him too ill for any operative interference, and not knowing from which end of the artery the blood came, Mr. Paget firmly bandaged the leg and thigh, placing compresses over the femoral artery both above and below the place of ligature.

4th.—Slept a little during the night. Skin cold; still no pulse to be felt at the wrist. He took a little beef-tea, and iced milk; but vomited the greater part of it. About five o'clock this morning, about half-an-ounce of arterial blood escaped by the side of the clot, which now projects considerably above the margins of the wound. 3.30 p.m.—About half-an-hour ago, a small quantity of blood escaped from the side of the clot. A sudden gush has just taken place from its centre, and although the wound was at once cleared out, filled with lint, and a tourniquet placed over it, he must have lost not less than six ounces of blood. 9 p.m.—Became more restless after the last bleeding, but retained his consciousness up to an hour ago, when he became a little delirious, and has just died.

A post-mortem examination was made eighteen hours after death. The femoral artery below the place of ligature was obliterated for about two inches, but above it was filled only with a soft and recent clot, and showed no sign of any reparative process having taken place after the separation of the ligature; the profunda was given off about seven-eighths of an inch above this spot. On examining the tumour, it was found to have no sac separable from the parts around, and was filled with coagula and blood-stained serum. Mr. Paget considered that it was not a true aneurism, but that it must have originated in an ulceration of the popliteal artery. No trace of disease was found in any other part of the body.

KING'S COLLEGE HOSPITAL.

**ILIAC ABSCESS.—FÆCAL FISTULA.—OPERATION
FOR CLOSURE OF THE ARTIFICIAL ANUS.**

(Under the care of Mr. FERGUSSON.)

W. O., aged 25, was admitted into King's College Hospital, in October of this year, suffering from an artificial anus. The patient is a healthy-looking man, and states that about six years ago he entered the navy, and was engaged in an action against the Russians in the Baltic. It seems that during the engagement he struck himself against the corner of "the companion hatchway," which gave him at the

time most exquisite pain; but he did not consult the Surgeon. The pain continued, and after three weeks he sought Medical advice. The bowels were now obstinately confined; aperients were ordered, and he experienced temporary relief. A few days after he was attacked with the diarrhoea, which was so prevalent at that time; this reduced his strength very materially, and he was sent to the Hospital-ship. Two months had now elapsed since the receipt of the injury, and he now noticed that a swelling had appeared in the right iliac region, and had attained so large a size that he was advised to go home on sick-leave. The tumour now gradually increased in size, and was as large as a child's head; this was punctured, and nearly a pint of fetid pus was evacuated. For six weeks the abscess discharged freely, and there appeared to be no communication with the bowel; but the patient having eaten a fig, the seeds were observed to pass through the opening. Various methods were adopted to close the aperture,—the actual cautery and pads were used, and the edges of the wound pared and brought in apposition without any benefit being derived. On admission into King's College Hospital, a fistulous opening was seen in the right iliac region, an inch and a-half above Poupart's ligament, and situated about two inches from the median line of the body; through this, fluid faeces were constantly escaping; but the discharge of evacuations from the rectum took place every four or five days, and were of a solid nature. A probe introduced into the opening clearly went into the bowel. His appetite was good, and all the secretions were healthy. Mr. Fergusson determined to make an attempt to close the opening; and chloroform having been administered by Dr. Anstie, the edges of the wound were pared, and the cut margins brought into apposition by silver-wire sutures. A pad of lint and a bandage were then applied, and the patient sent to bed. No bad symptoms supervened; but the faeces, which were still fluid, oozed through the wound. The external aperture was, however, clearly smaller than before the operation. Anxious that the patient should be improved as much as possible, Mr. Fergusson made a further attempt to close the opening, and on Saturday week, pared the edges and brought the parts together with iron-wire sutures, and the latter having been passed through a pad of cork, were then twisted. There was a good deal of irritation about the wound after the operation, and the pad was removed on the third day, but the granulations seemed to be healthy.

OBLITERATION OF VARICOSE VEINS FOR ULCER OF THE LEG.

On Saturday last Mr. Bowman tied the veins in the inner side of the leg above and below the knee by the subcutaneous method. The patient, a man, had had the ulcer for twenty-five years, but had continued at work. He was admitted when it was in almost a phagedenic state, the bed of the ulcer being matted with pus, and the edge for two or three inches hard and callous. It extended for a great distance over the front of the leg. The veins were enlarged and tortuous above and below, Mr. Bowman remarked that probably the same condition existed behind the ulcer. By rest in the horizontal position, the ulcer improved, became healthy, and commenced healing; but the source of the mischief still existed, and would certainly cause return of the disease. Mr. Bowman, therefore, decided on the operation. The patient was directed to stand on the operating-table until the veins were marked out by ink. Mr. Bowman next (the patient being now recumbent) passed two needles under each mass, an inch intervening between each. He next tied them, just tight enough to bring the included parts closely together and arrest the circulation, but not tight enough to strangle them; he then divided the part of the vein included between the needle subcutaneously with a small tenotomy-knife, closing the opening immediately by a compress. Mr. Bowman remarked that in this mode of operating, he had found suppuration extremely infrequent, especially when compression was used after the incision; and that when it did occur, it did not extend into the vein above, and thus the pus ran no risk of being absorbed into the general circulation. In a few days he would remove the lower needle, but as a matter of precaution would leave the upper one in a little longer, in order to render certain the complete coagulation of the included blood. This operation, he stated, was similar to that of Mr. Lee; but differed in this, that Mr. Lee did not divide the veins until several days after the ligation of the veins.

Medical Times & Gazette.

SATURDAY, NOVEMBER 19.

ADVERTISING QUACKS.

THE efforts of the various Medical Registration Associations which have been formed since the Medical Act was passed, have been directed, for the most part very successfully, against those who have illegally assumed Medical titles. It will be well for these Associations to consider if they cannot protect the public from the swindling daily perpetrated, under the guise of philanthropy, by the "Manhood" class of practitioners. There are cases in which, under any other circumstances, we should not know which to wonder at most, the almost fabulous credulity and blindness of the duped, or the audacity and transparent roguery of the duper. We question, indeed, if more money is not lost among the middle classes of society, through the machinations of these pseudo-Medical sharpers, than in all the gambling-houses of the metropolis. Yet the law still allows them to ply their horrible trade with impunity, and the press lends itself to further their designs. To guard the timid and unwary youth against their toils has been the only course left to the Medical journalist; but more perhaps may be done by taking the public behind the scenes, and showing them the kind of language the "Silent Friend" will most probably use to them when once he has them within his clutches, and what the meaning of "self-preservation" is according to the views of the *soi-disant* counsellor. The cases we have alluded to before seemed as strong as well could be; but, as will be seen, they quite pale before the extraordinary statement of a poor dupe, who once filed a bill in Chancery for protection against the members of one of these firms. The case occurred some time ago, but has not attracted so much attention as it deserved. The complainant, an agriculturist, living in Yorkshire, was, according to his own account, troubled with a disease which rendered the wearing of a truss necessary, and at the age of eighteen or nineteen was afflicted with a continual discharge of seminal fluid. For this he applied to several Quacks, and took medicine without benefit. About the year 1848, however, he fell in with one of the most redoubtable Advertisers—with what result we will allow our readers to discover for themselves. The following is an abridgment of the complainant's own statement as sworn to before the Lord Chancellor Truro; and where we have used quotation marks the very words of this remarkable document are given.

"About two years ago your orator perused in a newspaper an advertisement, which recommended certain medicines as remedies, prepared by Messrs. Perry and Co., of 19, Berners-street; and your orator purchased several bottles of said medicines and boxes of pills, and for some time continued to take them. . . . In November, 1848, your orator saw an advertisement, stating that the Messrs. Perry and Co. would be present at York, and advice would be given gratis to any person who should purchase medicines to the value of five pounds, and in consequence he attended and saw the younger defendant, Robert Perry, who told your orator that his case

was not hopeless, and that he could cure your orator, but it would cost a great deal of money—£100."

For this sum, the document goes on to say, a bill at six months was accepted by the orator, and Medicine was ordered for six months, at the expiration of which time the bill was paid,

"And the said defendant then told your orator that he could completely cure your orator, but it would require six or seven months longer, and that he must be confined to his bed-room and not stir out of doors. . . . That he was about to give your orator mercury, to salivation, and then described the horrible effects of mercury, and told your orator he must be prepared to endure it all, and went to a closet in the room and produced a most horrible bust, exhibiting the head of one in a state of salivation."

We must not here omit to state, by way of parenthesis, that in the consulting-rooms of some of this class, a most diabolical model of a man's face, ravaged with syphilitic ulcers, is kept behind a silk curtain; when a patient turns at all restive the curtain is slowly withdrawn, and the head is exposed as a kind of gentle refresher, which generally, as in the present instance, has the desired effect.

The document then goes on to say that on the orator stating that he would not and could not undergo such treatment on account of his business, "Robert Perry then said he could cure the disease without mercury, and that Perry and Co. were the only people in London who could do so, but it would cost a great deal more money—£500 (!) Another bill at six months was then given by 'Your Orator,' and Medicine for that time was ordered. This bill he paid when due to Mr. Lewis Perry, the father, who then 'examined your orator's person, and said he was going on well, and must not mind expense,' as it 'would cost money to effect a cure.' Your orator thereupon told (Mr.) Lewis, otherwise Louis Perry, that Robert Perry had undertaken to cure your orator completely for £500; whereupon Lewis, otherwise Louis Perry, remarked that Robert Perry was but a young man, and did not understand the nature of the case as well as he did." . . . "That it would require a still longer time, and more money, to effect a complete cure, and that your orator must not mind expense in a matter so important to himself." Whereupon, says the document, the defendant still insisted upon having more money, alleging that they were at great expense for advertisements, and in other ways; and your orator, pleading poverty for the present, said "at the death of his mother he might have a thousand pounds or two. Whereupon Mr. Lewis, alias Louis Perry, told your orator that some of his patients had paid him as much as £7000, and produced his books, from which it appeared as if such statements were true." "That your orator, if the treatment were not continued, would fall into a relapse, and never be cured; and that in case a relapse occurred, he would not undertake to cure your orator for £10,000!" but that now "he would undertake to cure your orator for £2000." The document goes on to state "that for the further sum of £2000, two bills were drawn by the defendant, and accepted by your orator, each for £1000, payable respectively at twelve months and two years after date. The first bill was dishonoured, whereupon the defendant came down to Yorkshire, and called upon your orator, and said, 'That if not paid he would expose your orator's character in the country, and that he would put the bill into the hands of a third party, who would come down 'slap-bang' upon your orator for the money.'"

It will not be necessary to follow this singular document any further, as it only goes on to recount the threats of proceedings brought by the defendants against their unfortunate dupe, and the appeal of "our orator" to the Court to prevent the negotiation of the bills, and for protection against any further proceedings on the part of the defendants with respect to them. It will be almost needless to say that this was

accorded by the Court, and that Perry and Co. were obliged to forego the splendid coup they had nearly made out of this unfortunate gentleman; and, in addition, they were forced to refund certain sums of money already extracted from his pocket by way of fees for advice and medicine. Our readers will not have failed to have remarked that in both the cases we have given the judicial decision was not only against the recovery of the amount for which the bills were fraudulently drawn, but the past services of the "advisers" were repudiated as a part of the fraud, and no remuneration whatever was allowed them for the time and trouble they had devoted to their dupes.

The moral we wish to draw from these and from several other cases which to our knowledge were never allowed by these "Silent Friends" to come into Court,—is that they are in reality much more afraid of the results of any exposure than any patient ever need be. That after some slight bullying and show of legal resistance they always give in in time, and that a determined lawyer's letter acts as surely upon them as a pinch of salt does upon a leech.

Our parting word, then, to all victims who may be secretly smarting from the rather expensive advice of a "Silent Friend," is to take the case at once into Court, unless your excellent "Friend" is too discreet to put you to such unnecessary trouble and expense; or if you do not wish to proceed in the matter yourself, to state the case to the Secretary of the nearest Medical Registration Association.

THE WEEK.

WE last year alluded to the extraordinary and disgraceful proceedings enacted by Military authority at Chatham, relative to soldier-lunatics. The practice has been discontinued for some time, but the military authorities at Chatham are again about to resort to the system of setting at liberty insane soldiers, who are found incurable, in the public streets, a communication having been a few days since received by the town authorities at Rochester, in which city the Military Lunatic Asylum at Fort Pitt happens to be situate, that an insane soldier would be set at liberty in one of the streets in the morning, the notice being given in order that the necessary steps might be taken to prevent his committing any outrage, and to enable the police to apprehend him. A proceeding more opposed to common decency can hardly be imagined as perpetrated under the name of public authority. It is a *scandalum magnum* without any kind of defence; disgraceful to those who are responsible for it, and utterly repugnant to the feelings of the age in which we live.

We are glad to see that, notwithstanding the efforts made to secure the execution of Annois, the Portuguese murderer, judgment has been stayed, in order that further inquiries may be made concerning the antecedents of the wretched man. We at the time protested against the conclusion of the *Times*, and are satisfied that no man of science or sense would calmly send to death a man who had committed an act so manifestly insane and objectless. The counsel who conducted the prosecution has himself (and to his great credit) made efforts in behalf of the man, to prevent execution of the sentence.

Public opinion has, at length, so far prevailed as to bring about such a reformation in the Army flogging system as will doubtless eventually lead to its complete abolition. We still maintain that flogging—such flogging as produces mutilation requiring Hospital treatment—is utterly unjustifiable on any principle, except on those which justify torture as a punishment for crime. The new Regulations, though a wonderful step in the right direction, are far from actually

abrogating the practice of flogging. Every soldier is, on entering the Army, to be placed in a Class called No. 1, and is not liable to be flogged except for gross insubordination; but he is liable to the lash-punishment if he be degraded to Class No. 2, which, doubtless, many soldiers will be. However, the step is one in advance; and we hail it as a sign of still further improvement in the same direction.

A free pardon of Dr. Smethurst has been granted. This was necessary before he could be put on his trial for bigamy, because a man under sentence of death is dead in the eye of the Law, and incapable, therefore, of performing any legal act—for instance, of pleading to the indictment. He is to take his trial for bigamy in the Criminal Court at the next sessions.

The Herts Medical Registration Society has carried out a resolution agreed to at the first annual general meeting, and has published a list of all Medical Practitioners (as far as known) resident in the county of Hertford, distinguishing those who are members of the Herts Medical Registration Society, and those who are not registered according to the provisions of the New Medical Act, 21 and 22 Vict. cap. 90. Such a list published in every large town or county, would be of infinite service, by making known the names of those Practitioners who have not afforded the usual guarantees of the possession of such a Medical education as entitles them to the confidence of the public. We trust that the example of our brethren in Herts will be generally followed.

The appeal in the case of the London Medical Registration Association v. Frederick Gould, Kingston-on-Thames, will be heard this day at the Court of Queen's Bench. Mr. Lush, Q.C., is specially retained. The "Surgeon-Dentist" question is sure to arise in this case. Dr. Ladd (through Mr. Bowen May) submitted this question to Mr. Lush, whose opinion we quote:—

"I am of opinion that Dentists who are not registered are not entitled to use the prefix 'Surgeon,' and that they are consequently liable to the penalty prescribed by the 40th Section, notwithstanding the saving clause at the end of the Act. The question is rather one of fact than of law, and I advise, upon the assumption that there is, as stated in the case, a class of Practitioners who study Surgery, and who pass the College for the purpose of practising as Dentists in the higher department of the Profession, and who are known as 'Surgeon-Dentists.' Those who have not so qualified themselves have no right, I think, to assume that title. The question will probably be carried to the Superior Court upon a case stated by the magistrate, and this will be the most satisfactory course to all parties.

"Temple, Nov. 12, 1859."

"ROBERT LUSH.

Lord Elgin has been elected Rector of the Glasgow University. The following was the final state of the poll. The "Nations" do not appear to have "so furiously raged together," as they have been known to do on former occasions:—

	Disraeli.	Elgin.
Natio Glottiana	140 ..	193
„ Londoniana	91 ..	101
„ Rothseiana	72 ..	141
„ Transforthana	108 ..	118

Lord Elgin had thus a majority in all the Nations, and was numerically above his opponent by 142 votes. The total number of students who voted was 964, out of 1020 matriculated students in the University. There was nothing like a serious "demonstration" during the day, although the usual amount of pea-throwing, cheering, hooting, etc., pre-

vailed. The return of Lord Elgin is mainly due to the energy and determination shown by the Liberal Association, ably backed up by the Independent Union.

Our readers will learn from an advertisement which appears on the cover of this number, that Sir John Forbes is retiring from practice—as a sale of some very valuable engravings, among other things, is to take place at his house, in Old Burlington-street, on the 30th inst. We allude to this now, as it may appear strange to many of Sir John's friends that no *books* are to be sold; and it is right it should be known that he has presented *all* his Medical works, numbering between two and three thousand, to his old *alma mater*, Marischal College, Aberdeen. We express very feebly the sincere wish of all Sir John's friends, and of the Profession to which he has so long been a "shining light," when uttering the heartfelt hope that he may pass many happy and useful years in the honourable retirement he has earned so well.

Small-pox is spreading in the Metropolis of the country of Jenner. Several deaths, and many more cases, are recorded in Dr. Thomson's last Monthly Report of the Health of Marylebone. This gentleman says:—

"Although the central vaccination station in High-street has not been so directly successful as could have been wished, it has been the means of bringing me into contact with the public vaccinators, and of obtaining, by the liberality of the Registrars complete lists of all the localities where births occur, which I have placed in the hands of the vaccinators. The establishment of the central station has, therefore, been the means of improving the vaccine organisation, and has contributed to the vaccination of many persons to whom I have given notices, whose names do not appear on the central station list, as I have traced several vaccinations to the district stations, and even to Institutions out of the parish. It is gratifying to state, that, although I have met with some obstinate parents, it has not been found necessary to issue a single summons, moral suasion having hitherto, as I anticipated, fully succeeded; but the decision of the Vestry to take action in extreme cases has undoubtedly exercised a powerful influence throughout the parish."

Two Medical men of the same borough have addressed a letter both to us and to the *Times*, pointing out the great danger incurred by inefficient and insufficient vaccination; urging the importance of obtaining a fresh supply of lymph from cows; and the appointment of a sufficient number of properly-remunerated Public Vaccinators. This last recommendation is what we have advocated over and over again in these columns.

The influence of the Medical element in the recent elections at the Edinburgh University has been of the most gratifying nature. We are indebted for the following facts to the able letter of an "Edinburgh M.D.," which appeared in the *Morning Post*:—

"Three-fourths of the total number of voters belonged to the professions of Divinity, Law, and Medicine. They voted thus:—

	Total.	Brougham.	Buccleuch.
Lawyers	259	117	142
Clergy	289	151	138
Medical Doctors and Surgeons	200	153	47
	748	421	327 "

After analysing the votes of the other Professions, the writer goes on to say, that

"Medical men are, from their calling, thoroughly worked up with all parties and classes; and therefore, as might have been anticipated, their votes fairly represented public opinion. Of the 200 Medical Members of Council who voted, 153 polled for Lord Brougham. The small number of Medical votes is

explained by the fact that a Scottish Medical degree does not qualify to sit in a Scottish University Council, unless there is also proof of four years' resident University education."

The Medical element, at present small, will rapidly gain strength, and will ultimately become the most powerful (numerically) in the General Councils—a fact which is not easily believed till an examination of the subject has been made. If we are right in this calculation, and if voting by signed lists be allowed in the General Council elections (a point now before the Commissioner), the Scottish Medical Graduates may soon virtually have the election of a Parliamentary representative; for it is well understood, that in any new Reform Bill the Scottish Universities are to have at least one Member. The letter from which we have just quoted, shows in a remarkable though incidental way, that there is less political partisanship in the Medical than in the other Professions.—On the day our last number was published, the election of Rector took place; and as we hoped and anticipated, Mr. Gladstone was the victor. He beat Lord Neaves by a majority of 116. The numbers were, 643 and 527. The voting (by matriculated students) took place between eleven and one o'clock, in fourteen class-rooms, the polling being by hundreds in each room according to the number of the matriculation ticket. At one the Professors met, added the poll-lists, and announced the result by posting a certificate. There was intense excitement. The contest was in no respect a political one. The great majority of the Medicals were for Gladstone. Mr. Gladstone is now, therefore, President of the University Court of Edinburgh, with a deliberative and a casting-vote. He has also to name his "Assessor," who will be one of the eight Members of the Court.

Science and Literature seem to be reviving in Italy amidst the throes of its revolutions. Activity prevails in all the Universities freed from Papal and Imperial tyranny. Whole batches of new Professors are seated on newly-erected chairs at Parma, Modena, and Bologna. In the latter place the office of *Rettor Magnifico*, or President, has been offered to Count Carlo Pepoli, long a resident in England, and well-known as a poet and scholar.

"In Tuscan new professors are called together from all parts of Italy. The Sicilian historian, Michele Amari, had been summoned from Paris to the expressly-created chair of Arabic at the University of Pisa by one of the very earliest acts of the Tuscan Provisional Government in April last. Ferrara, also a Sicilian exile, for some time Professor of Political Economy at Turin, was lately destined for the same University. Both of them, however, have now been called to Florence, where they are to lecture at the *Schola di Perfezionamento*, or Upper School, which Ridolfi intends to place above the two Universities of Pisa and Siena, as a kind of Supreme Court of Learning for all Tuscany. Dr. Tommasi, a very able and distinguished Neapolitan physiologist, who practised Medicine at Turin since his banishment from his country in 1848, has been raised to the chair of *Clinica Medica* at Pisa. Not a few of the great Italian scholars and men of science whom political vicissitudes had for the last ten years congregated at Turin are now once more moving back to the more genial sojourns of the Lombard and Tuscan towns, especially to Milan and Florence."

A Dr. Airey, who has recently astounded Bristol by such advertisements as the following, copied from the *Western Times*, has been fined £20 for illegally assuming Medical titles:—

"A thousand patients receive benefit weekly, and no deaths—no bleeding to murder—no blistering to torture—no poisons to destroy. Dr. Airey, Member of two Colleges in New York (not registered in England), may be consulted daily, advice free, at his Lecture-hall, 30, Castle-street,

Bristol. More wonderful cures.—Mr. John Crocker, 9, Barton-place, Barton-road, Bristol:—"I have suffered from the tic and pain in my head for two years, and have had four teeth drawn for it, but all to no use. I am happy to say that Dr. Airey has cured in one minute.—John Crocker." Mr. John Saunders, servant, Clifton:—"I have suffered most severely from the piles and diseased liver for more than ten years. I have been cured by Dr. Airey in one week. It is really a miracle how the medicine cured me. The first dose gave me relief; I never was better in my life.—John Saunders." Mrs. Mary Ann Davis, 46, Hill-street, St. Paul's Bristol:—"I suffered from the pain and tic in my head and face for two weeks, night and day, and I have been cured by Dr. Airey in one minute.—Mary Ann Davis." Mr. Edward Robinson, Temple-street, Bristol:—"I have been affected with rheumatic pains in different parts of my body for three years. I have tried nine doctors in Bristol, without receiving any benefit. Dr. Airey has made a good cure of me in four days.—Edward Robinson."

And so on by the yard! A charge was made before the Bristol magistrates that,—

"The defendant did take and use the name of 'Doctor,' and did use the initial letters M.R.C.S., and M.R.C.P., as an addition to his name, thereby implying that he was registered under the Medical Act, and was recognised by law as a Physician and Surgeon, such not being the truth."

The use of the letters M.R.C.S. and M.R.C.P. was proved, and the defence advanced was,—

"That Dr. Airey was a duly-qualified Medical Practitioner according to the laws of the United States of America. That he was a Member of the Reformed College of Surgeons, and of the Reformed College of Physicians of New York, and therefore, that the title Doctor, with the initials M.R.C.S. and M.R.C.P., which he had assumed, were strictly conformable with truth, and with his diplomas from those colleges. Defendant's counsel also produced some of defendant's Medical works, hand-bills, and advertisements, to show that he had distinctly denied being registered in England. The diplomas from New York on which the defendant relied were produced, but he did not verify them by evidence, nor did he prove that he was a 'Doctor of Medicine of any foreign or colonial university or college, practising as a Physician in the United Kingdom before the 1st day of October, 1858,' within the meaning of Schedule A, clause 11, of the Medical Act. Nor that he had satisfied the Medical Council that he had taken his degree of Doctor of Medicine after regular examination; or that there was sufficient reason under sec. 46 of the Act for admitting him to be registered."

As this case is very important, we give the concluding portion of the judgment of the presiding magistrate in full:

"Two questions now arise for our consideration: 1st. Did the defendant take and use the title and additions which have been alleged against him for the purpose of implying that he was registered under the Medical Act? and, 2nd. Did he so act for the purpose of implying that he was recognised by law as a Physician and Surgeon? On the first point we think that reasonable doubt exists, and we therefore find that the defendant is not guilty of so much of the information as charges him with having done the acts in question for the purpose of thereby implying that he was registered under the Medical Act. On the second point we think that the words in sec. 40, 'recognised by law as a Physician or Surgeon,' mean that the person practising must be recognised by the English law. We think also that the Medical Act is *general* in its application, and that, although a person may be duly qualified according to the laws of a foreign country, he must satisfy the requirements of the Medical Act before he can legally practise in Medicine or Surgery in England. Under these circumstances we find the defendant guilty of so much of the information as charges him with having done the acts in question for the purpose of implying that he was recognised by law as a Physician and Surgeon, whereas in fact he was not so recognised, and we convict him in a penalty of £20, and in default of distress one month's imprisonment."

In a recent number we gave a full abstract of a paper by Dr. Hayes, late Surgeon to the United States Grinnell Arctic Expedition, in the *American Journal of Medical Science*,

containing some interesting remarks respecting the relations which exist between food and the capabilities of men to resist low temperatures. A Correspondent writes as follows:—"The remark of Dr. Hayes respecting the absence of phthisis among Esquimaux reminds the writer of these lines of an interesting circumstance which he remembers hearing of in Edinburgh some time after the departure of Sir J. Franklin's fatal expedition. In a letter from Mr. Goodsir, one of the Assistant-Surgeons of the expedition, it was stated, that he had been visiting an Esquimaux who was in the last stage of phthisis, that the man was half covered with earth, and that some moss was growing on his body. This was the last letter ever received by his friends from the young and talented writer of it."

REVIEWS.

On the Diseases and Injuries of the Joints. Clinical and Pathological Observations. By THOMAS BRYANT, F.R.C.S., Assistant-Surgeon at Guy's Hospital. Octavo. Pp. 273. London: 1859.

MR. BRYANT has made himself known to the Profession by some good papers on one or two important Surgical and Pathological subjects. In the work now under notice he has entered into the consideration of a class of diseases which have always claimed the most careful attention at the hands of every good Surgeon and Pathologist. A comprehensive work on the diseases of the joints, written by a Surgeon of large experience and sound judgment, would be hailed by every one as a real boon. The subject, however, is so extensive, and requires such a large amount of practical knowledge that it is hardly to be expected that any young Surgeon should be able to effect all that is desirable. We mention this because it is to be feared that many on reading the title at the head of the book will be disappointed. And as it is not fair even to hint at a charge of insufficiency without being able to prove it, we will, without proceeding into detail, just refer the reader to one point connected with articular disease, about which he would very likely seek for information in a new work on diseases of the joints,—we mean Gonorrhœal Rheumatism. This very interesting and difficult subject is discussed at page 25, just in ten lines and a-half, eighteen more lines being devoted to a case illustrating this disease.

Nevertheless, there is a considerable amount of useful matter in this book. The morbid appearances in diseased joints are in some cases faithfully, and in many very elaborately detailed. A true pathology is one of the most important foundations of Surgical knowledge and treatment: the author has executed this valuable part of his subject in a manner which shows his appreciation of this truth.

The first chapter is devoted to the Inflammatory Affections of the Synovial Membrane. The morbid appearances are well described. Mr. Bryant mentions a case where he distinctly discovered fine radiating vessels beneath the fibrinous material which was poured out over the cartilage in a case of inflammation of the synovial membrane. He considers that this case is sufficient to settle the point as to the continuation of the synovial membrane over the cartilage.

In the second chapter, which is brief, those serious disorders of the joints, known under the name of Pulpal and Gelatiniform Disease of the Synovial Membrane, are treated of. The author recognises, with most Surgeons, the extreme obstinacy and danger of the pulpal thickening; but at the same time seems to think that a good deal may be done by proper treatment in some cases.

In the next chapter the Morbid Changes taking place in the Articular Cartilages themselves are considered at length. The author agrees with the majority of well-informed Surgeons that diseases of cartilage are the result of extension of morbid action from other textures. In the treatment, Mr. Bryant gives no new directions or remedies, but advises great reliance upon hygienic measures, and absolute rest, which, if they do not cure the disease, may bring about a stiff limb:—"Much time and patience are required to procure this desirable condition upon the part of the patient and the

Surgeon, but it may generally be obtained by due attention on both sides."—P. 67.

Chapter IV. is devoted to the consideration of the Diseases of the Articular Extremities of the Bones. The author divides them into two classes—the inflammatory, and those where morbid growths are developed. The changes which take place in inflammatory condition of the heads of bones are very well described. Strumous disease is rare, if the term be used in its strict sense; but we entirely differ from Mr. Bryant in his opinion that it should be confined to those cases where the true cheesy deposit is found. The term is very rightly applied to chronic inflammation of the end of a bone occurring in weakly, scrofulous persons, and is usefully applied as suggestive of the proper plan of treatment which should be adopted. Perhaps in the whole catalogue of articular disease there are no cases which so demand the attention of the Pathologist and Surgeon, for in many of the cases, especially those where the affection is situated at the knee-joint, morbid action, which may appear only to be limited, insensibly progresses, extends into the cavity of the joint, and produces irreparable mischief. Timely treatment, however, or a well-chosen operation will frequently hinder this; how often, for instance, it is possible in a case of circumscribed abscess of the head of the tibia encroaching upon the joint, by scooping out the diseased cavity and removing any portion of dead or loose bone, to prevent the implication of the articulation itself, which would almost infallibly take place were proper measures not taken! Some interesting cases illustrating important practical points are detailed in this section of the work.

After touching upon the subject of Tumours on the Articular Extremities of Bones, Mr. Bryant, in the eighth chapter, considers at considerable length the important question of ankylosis of joints, and describes the several conditions under which this is met with. There is a difference of opinion among Surgeons as to whether the true bony ankylosis is frequently seen. The author states, as his view, "that bony union is not an unfrequent termination of diseased joint, although it is somewhat difficult to decide with accuracy by what pathological process such a result may be produced."—P. 116.

The treatment of fibrous and partial ankylosis by forcible rupture is looked upon with favour, especially in the case of the hip; but when the knee is the joint affected, gradual extension, by the use of the posterior angular splint, is that which, with many other Surgeons, Mr. Bryant recommends. To tenotomy he is not very favourable as an adjunct in the treatment, or at any rate he considers that it is not advisable to put it in force in many cases where some orthopædists would practise it. With regard to the line of practice which is best in those cases where a true bony ankylosis of a joint in a position very detrimental to its owner has occurred, the reader will not gain any very definite idea from the author; nor does he enter into the very important question as to the propriety or expediency of removing a wedge-shaped portion of bone, or of performing excision in those instances where a useless and unsightly ankylosis has taken place.

Mr. Bryant after having, on various occasions in discussing previous points, referred briefly to the great question of amputation or excision, enters into the consideration of this important subject in the next chapter. We should have expected to find that a large amount of information on this matter would have been furnished by an author attached to a large Hospital. Mr. Bryant, however, throws no light whatever on the subject, and neither gives us information of his own, nor does he furnish the Profession with the experience of others. The ordinary remarks about the recovery of limbs after they have been doomed to amputation are made, and the author lays great stress upon the propriety of trusting to the powers of Nature, but cares little about pointing out those features which, notwithstanding the power of Nature, are seen associated with diseased joints in too numerous instances, and which render a surgical operation necessary, or doom the patient to a miserable life and early grave. The author, too, granting the necessity of active surgical interference, does not lay down any distinct rules for our guidance in the selection of the operation to be done. Moreover, he makes some mistakes which he should have avoided; thus, for instance, he denies the possibility of removing the diseased acetabulum in excision of the hip. Now, Mr. Bryant ought to know that it is not only possible, but that the object has been effected, and that patients have

recovered after the head of the femur and the whole floor of the acetabulum have been removed. No one would think of denying that the glenoid cavity of the scapula could be taken away; yet it seems to be little understood that the cotyloid cavity may be got at with almost equal facility when the head of the thigh-bone has been removed. From not considering this point, Mr. Bryant has fallen into grievous practical error, laying down the law that the "operation of excision (of the hip) should not be performed." We give his own words here, to avoid all chance of misconception:—

"Excision of the hip-joint is not suggested as a substitute for amputation, as such an operation is never performed for disease of the articulation, but comes before us as an extra means of affording relief in these painful cases. There is, however, this serious disadvantage, that both surfaces of the articulation cannot be removed. It is very rare for only one surface of a joint to be diseased, even in an early stage; and in such a condition where the joint has become disorganised, there can be no question that both surfaces will be involved; no means that we possess will inform us in which bone or upon what surface the disease is most extensive, nor can we learn what part is capable of repair. The great advocates for excision of joints dwell forcibly upon the rule of practice, which they hold out as the chief cause of success; that the removal of all the articular surfaces of the joint is a *sine qua non*, and that the section of the bone should be a liberal one. In the hip-joint this rule cannot be carried out. The pelvic portion of the joint can be but little interfered with, and can certainly not be removed; and one portion, therefore, only of the joint, viz. the head of the femur, can be excised. Under these circumstances, there are not many instances where much benefit can be expected, and as a consequence the operation of excision should not be performed.

"There are examples of acute and chronic inflammation of a joint terminating in necrosis, where the necrosed bone by its presence keeps up irritation and suppuration, and where good can be expected by the removal of the dead bone; in such, the bone may be removed, or such portion of it as will come away. But surely these are not cases of excision of a joint. The dead bone is keeping up the disease, and by its removal, if the disease is not arrested, benefit may fairly be expected."—Pp. 144, 145.

As regards excision of the ankle-joint, Mr. Bryant deals with the subject in a very summary manner. "When the ankle-joint is disorganised, I am unable to find any advantage in excision; if a stiff joint ensues, the foot is dreadfully in the way, and the chances of a obtaining a moveable one are very slight."—P. 146.

Now it is very evident from this passage that the author has never seen a case where excision of the ankle-joint has been performed. If he had had the opportunity of seeing one or two cases where the operation had been successfully done, he would find that the foot, instead of being in the way, was a very serviceable one. Surely Mr. Bryant can hardly be ignorant of the fact that this operation has been performed with great success.

We should have expected to find some useful information regarding that very important and much-discussed question of excision of the knee-joint; but the author gives us little help in clearing away the difficulties which beset this subject. In all probability he has not had much personal experience of the operation. He states that statistics prove that amputation of the thigh is less fatal than excision of the knee-joint.

"If then by the operation of excision of the knee-joint the dangers to life are greater than in amputation, and as the advantages gained by preserving the limb are not so great as to cover this extra risk, the propriety of selecting amputation cannot be questioned."—Page 142. After making this statement, he, in the next pages asserts, by his own statistics as compared with those of Mr. Butcher and Mr. Price, that excision is the more fatal operation, and nevertheless he states:—

"At the same time I would add, that in select cases there is no doubt that it should be performed; and that as time progresses, and more experience is acquired, the operation will become less fatal, and, consequently, more frequent."—P. 144.

It will be thus seen that it is difficult to ascertain what the author's real opinion about the matter is: for in one place he states, if there is more danger in the one operation, "the

propriety of selecting amputation cannot be questioned;" and in the other, after demonstrating that the excision is much the more dangerous proceeding, Mr. Bryant affirms "that in select cases there is no doubt that it should be performed."

As regards statistical details there is such a wide divergence of opinion among the various writers who have collected them, that it is impossible to arrive at any correct conclusion as to what is the average mortality after amputation of the thigh; but with reference to excision of the knee, it is pretty well ascertained that the mortality is about one to five; and we fear that if all the cases of amputation for disease of the knee could be collected, the fatality would not be less than this. It is true that in the hands of one operator, or at one or two particular Hospitals, the deaths may have even been much less than this for a series of years,—but in other instances the mortality will have been found to be much greater. It is the case with excision of the knee. We know of one Surgeon who has operated largely, and has had a mortality of fifty per cent.; but we know an instance where another Surgeon has also operated largely, and has met with a mortality of only six per cent.

We strongly suspect that, after all, the deaths from each operation will be found to be much about the same; and if this be granted, or even if there be only a doubt about the matter, we do not hesitate to say, after having seen many cases where the patients have obtained most efficient limbs, that that Surgeon who would reject excision in proper cases, and select amputation, would be as guilty of as much neglect towards his patient, as though he were, in a case of popliteal aneurism, to refuse employing pressure, or, in certain cases of stone, to perform lithotomy rather than lithotripsy.

The second part of the book treats of the Injuries of Joints. On this subject we shall do no more than give a passing notice. The most important point discussed is, perhaps, that of compound fracture into joints, a class of cases which will always demand the most careful study, and most skilful attention on the part of the Surgeon, and the difficulties of which cannot be appreciated by any one who has not had considerable opportunities of seeing and treating these formidable injuries. With regard to that terrible accident, compound fracture into the knee-joint, the extremely practical and important question of amputation is scarcely referred to by Mr. Bryant. We are glad to find that he is in favour of attempting to save the limb, even after this injury, warranted as he is by the result of a case detailed by him, where a man, aged 51, escaped with his life, and with a useful member. It has hitherto been generally considered that in the case of an adult, who has met with a compound fracture into the knee-joint, amputation should be at once performed if there be no internal injuries; but we agree with Mr. Bryant that there should be hesitation in resorting to this desperate measure. As regards excision in the instances of compound fracture, or dislocation into the smaller joints, there cannot be much doubt regarding its propriety, although every Surgeon must have met with instances where he has had to regret resorting to this measure instead of amputation. As to the expediency of the same measure in these severe injuries of the hip and knee, there must be greater doubt. Mr. Bryant speaks in favour of this measure.

With the consideration of the various Dislocations of the Joints the work is concluded. There is evidence in it to show that Mr. Bryant has very laboriously and carefully studied some part of the subjects upon which he has written. Many of his pathological illustrations are clear and correct; but in the matter of treatment, the end of all pathological and anatomical research, his views are undecided and imperfect. His references to authority are extremely limited, and there is no doubt that some of the errors Mr. Bryant has fallen into have arisen from the want of appreciation and careful study of the doctrines and opinions of other Surgeons. Still, with all the exceptions we have taken to it, we must regard the work as one of great interest to the practical Surgeon.

ALREADY 12,500 francs have been collected for the erection of statues to Lapeyronie and Barthez, at Montpellier. "Let us hope," says the French journal which announces the fact, "that the artists who have the execution of the work committed to their charge, will be more happily inspired than the author of the disgraceful statue of Jenner, which is destined for Boulogne, and at present exposed at the Louvre."

POISONING BY PHOSPHORUS MATCHES
IN FRANCE.

PROBABLY owing to the difficulties which are thrown in the way of the purchaser of ordinary poisons, poisoning by phosphorus matches has become, since about 1846, of very common occurrence in France. It is evident that this can only be obviated by the manufacture and sale of matches of an innocuous character, and to this object scientific men, manufacturers, and the Government have for some time past been turning their attention. One of the most recent documents upon this subject is a Memoir on Poisoning by Phosphorus, read to the Academy of Medicine by M. Reveil, and reported on by M. Poggiale. The results of Orfila's, Reveil's and the reporter's experiments show that phosphorus introduced into the stomach may give rise to violent phlegmasia, going on to ulceration and fatal perforation. This is, however, not always the case, the phosphorus introduced into the economy seeming, in other instances, to modify the composition of the solids and fluids, and disturb their physiological action. In many cases the two modes of operation are combined. The phosphorus acts much more readily upon the empty stomach, and when in a state of minute division or solution. The acids of phosphorus are not poisonous, acting only as the strong acids do when in a state of concentration. Besides the expulsion of the poison, magnesia constitutes the best remedy, not only saturating any acids that may have formed, but sheathing and mitigating the effects of any of the unchanged poison, this latter effect being also producible by means of starch.

The reports, which have been made by Chevallier and Tardieu upon the subject have strongly recommended the substitution of red or amorphous phosphorus for the ordinary phosphorus; but no legislative action has as yet been taken in that direction. Still M. Poggiale regards this as the only feasible suggestion. The red, or amorphous phosphorus is an allotropic transformation of ordinary phosphorus, and takes place as a consequence of exposure to the sun's rays in vacuo, or in an atmosphere of azote or hydrogen. It may be prepared on a large scale for commercial purposes by M. Schrötter's process. The substance which results is a red powder, which does not disengage any acid vapours, may be preserved in the air without change, and is both innocuous to the manufacturers of matches, and destitute of poisonous qualities.

Here would seem to be the very substance, but in fact there are great obstacles to its production, for not only is this more expensive than in the case of ordinary phosphorus, but according to a most accomplished chemist's—M. Gaultier de Claubry—report to the Minister of Agriculture, the process of transformation of ordinary into amorphous phosphorus (the phosphorus requiring to be maintained for a long period at a temperature of 250° to 260° C., in closed vessels) is a highly dangerous one, and one if performed on a large scale would give rise to numerous dreadful accidents. The change would also then often be only imperfectly operated, and phosphorus believed to be innocent would still contain poison. M. de Claubry asserts that a patented process of M. Canouil, based upon the employment of chlorate of potash to the exclusion of phosphorus, unites every desideratum, both as to safety in manufacture and efficiency and innocuousness of the article produced.

We may here subjoin a notice of two or three of the most recent cases of poisoning that have occurred in France, related by M. Tuefferd. An infant three months old, in perfect health, was seized with vomiting, emitting a garlic smell together with colic and diarrhoea one hour after some phosphorus matches had been given to it, and died in about twenty hours. The stomach exhibited excessive friability, and not only the mucous membrane but the muscular coat was found reduced over large patches into a pale greyish pulp, the serous membrane alone resisting. The appearance was entirely different from inflammatory ulceration, there being neither injection, tume-

faction or thickening. The bladder was colourless and completely empty. Another child aged three years was also seized with alliaceous-smelling vomiting in the midst of health after the poison had been given him and died in about ten hours. The autopsy was only performed 81 days after interment, and therefore the appearances were not so conclusive. The interior of the stomach was smooth and whitish and deprived of its mucous membrane containing sanguinolent matters of a gelatinous consistency. In both cases phosphorus in the state of acid was discovered, and the culprit confessed the offence. The other case was that of a man 46 years of age, who for the purpose of suicide, swallowed all the paste of two boxes of matches. After intense suffering, great vomiting, and the administration of magnesia, he so rallied that the next day he incautiously resumed a laborious business. Symptoms of gastritis next day reappeared, and in twenty-four hours after the relapse he died. The autopsy revealed acute gastritis.—*Bulletin de l'Acad. tom. xxiii., page 1229.*—*Annales d'Hygiène*, October, page 260 and 370.—*Journ. de Chimie Méd.* August, page 480.

EXCERPTA MINORA.

Formula in Mentagra.—As a local application, M. Richard employs the following solution, frequently applied, with good effect:—Sulph. of zinc, 16; sulph. of copper, 5; water, 500; and laurel-water, 15 parts.—*Presse Méd. Belge*, No. 25.

Tannin Crayons in Affections of the Uterus.—M. Becquerel finds these of great service in affections of the cervix uteri, being advantageous substitutes for intra-uterine injections. They are formed of tannin 4, and gum tragacanth 1 part, mixed up with crumb of bread. They are about one-sixth of an inch in diameter, and an inch long, and are passed, by means of a forceps and speculum, through the os uteri into the cavity of the uterus, in which they are kept by means of charpie, moistened with a concentrated solution of tannin. The crayon softens and dissolves; and at the end of twelve hours the charpie is withdrawn by means of a thread attached to it. A new crayon is introduced every third or fourth day, and after a month's treatment the fungosities of the mucous membrane gradually disappear, and hæmorrhage ceases.—*Bull. de Thérap.*, t. lvii., p. 365.

Iodide of Ammonium in Syphilis.—As the result of several trials made by M. Gamberini, of Bologna, it is stated—1. That it is suitable in all cases in which iodide of potassium and sodium are employed. 2. It leads to a rapid cure. 3. The quantity given daily may be carried as high as from $\frac{3}{4}$ to $\frac{3}{2}$, and intolerance is rarely exhibited. 4. Employed in friction with olive-oil, it causes the disappearance of nocturnal syphilitic pains. 5. The signs of intolerance are a sense of burning in the throat and heat of the stomach; these rapidly disappearing on the suspension of the medicine for a couple of days. 6. Under the internal use of this medicine indurations consecutive to hard chancre disappear, as do also the indurated ganglionic pleiades in the groin. 7. Arthralgia, rheumatoid affections, periostitis, enlarged glands, and papulo-vesicular syphilide of the back, are the forms of syphilis which have best yielded to this drug.—*Ibid.*, p. 378.

Epidemic Catarrhal Orchitis.—When orchitis has occurred during the prevalence of mumps it has usually been considered as the result of metastatic action; but in a recent epidemic of catarrhal fever, described by M. Desbarreaux-Bernard, of Toulouse, to which the prevalence of mumps imparted a special character, this explanation would be at fault. For in several patients the affection of the testis appeared at once, without any preliminary affection of the parotid whatever. It came on during the catarrhal fever, the pain, however, being only slight, and the tumefaction assuming a globular—rather an ovoid form. Individuals of all ages were attacked, and several of these were patients in the Hospital, suffering from or convalescent from various serious diseases.—*Ibid.*, p. 378.

Chloride of Sodium as an External Resolvent.—M. Ancelon affirms that chloride of sodium employed externally, whether in powder, or incorporated with lard or linseed oil, forms a most admirable resolvent of indurated lymphatic glands. Frictions made with a pomade composed of it will induce an eruption resembling variola, which proves of great use in pulmonary phthisis and in chronic affections of the alimentary canal.—*L'Union Méd.* No. 132.

GENERAL CORRESPONDENCE.

THE MEDIAN OPERATION FOR STONE IN THE
BLADDER.

LETTER FROM MR. TODD.

[To the Editor of the Medical Times and Gazette.]

SIR,—In consequence of my absence from home, your remarks upon Mr. Bowman's operation for stone at King's College Hospital, performed on Saturday, October 8, escaped my observation (a); but the other day my attention was called to them by Mr. Ferguson, of Giltspur-street, who has made, by my directions, an instrument supplying, I think, the deficiency which that eminent Surgeon, Mr. Bowman, complained of.

Some ten or twelve weeks ago, I had the privilege of seeing Mr. Lloyd perform his operation for stone, and the want of a proper dilator struck me forcibly. Mr. Lloyd himself felt it during the operation, and afterwards remarked upon it. I went to Mr. Ferguson, and requested him to make, according to my drawing, a dilator especially for this purpose; it is a modification of the dilators which you did me the honour of publishing in your Journal some months ago, for stricture of the rectum. In my remarks at that time, I stated that this form of dilator would be found useful in the median operation (Lloyd's); and as soon as the woodcut can be got ready, I shall ask you to receive a few remarks upon this method of operating, and a description of the instrument which Mr. Ferguson has made for me. I am, &c.

16, Old Burlington-street.

ARMSTRONG TODD.

THE "FELL" SYSTEM.

LETTER FROM DR. SYNNOT.

[To the Editor of the Medical Times and Gazette.]

SIR,—One instance of a "cure" of cancer by the Fell system has come under my notice, of which I send you a brief account. When Dr. Fell first made his appearance in this neighbourhood, I went, with several other Medical men, to his house. He received us most politely, and in speaking of his peculiar mode of treatment he boasted of its great advantage over the knife; in the first place, in its comparative freedom from pain; and in the second place, that the disease did not return after being removed by his process; as his remedy not only destroyed the local disease, but also exerted a specific effect upon the constitution. He also declared that his remedy contained no mineral caustic, but that all its virtue and efficacy depended upon a peculiar vegetable ingredient in his paste: but to return to the object of this note—

On July 4, 1857, I saw Miss J. Y., 46 years of age, of a thin and spare habit, dark and unhealthy complexion. In the preceding November or December she was operated upon by Dr. Fell, and after several weeks of his peculiar treatment the tumour came away. The wound was a very long time in healing. When I saw her, where the left breast had been there was a very large puckered cicatrix tightly drawn over the ribs, and in places of a stony hardness; some of the glands in the axilla were enlarged and hard, and scattered through the sound skin; around the cicatrix were several nodules of cancer. This lady having recovered from the attack for which I attended her, passed from under my observation, but I have heard that she died not very long afterwards of cancer.

I am, &c.

ROBERT SYNNOT.

16, Eaton-terrace, S.W., November 14, 1859.

PLACENTA PRÆVIA.

LETTER FROM MR. R. F. SNAPE.

[To the Editor of the Medical Times and Gazette.]

SIR,—The following case will illustrate Dr. Lee's principle of turning with two fingers:—

I was called to see Mrs. B—— at 9 a.m. November 10,

(a) *Vide* Hospital Notes of No. 485, October 15, 1859.

1859. She was expecting her confinement in three weeks or a month; found her suffering from sharp hæmorrhage, which ceased while I was in the house. Upon examination I found the os uteri high up and quite closed, and was unable to introduce the finger to ascertain presentation. Enjoined perfect quiet, cold drinks, and applied cold to vulva, also prescribed infus. rosæ co. c. acid sulph. dil. ʒj. om. two vel three hor. At nine p.m. next evening, November 11, I was hurriedly summoned, and found that most alarming hæmorrhage had taken place. Patient almost pulseless, and altogether in a very dangerous condition. Upon examination found os uteri in same position, rigid and dilated to about the size of a shilling, could feel the placenta presenting. I was determined to attempt delivery, for if another flooding came on I felt certain the patient would succumb. I accordingly administered a stimulant, then introduced my hand into vagina and with considerable difficulty succeeded in passing two fingers through the os uteri. I separated the placenta attachment as far as I could, and behind it felt the child's head enclosed in the membranes. By perseveringly tilting it upwards I succeeded in altering its position until I felt a foot; I then ruptured the membranes and seized it, and with considerable difficulty I brought it into the vagina. I had to keep up firm and lengthened traction before the rigid os would permit the passage of the nates, the trunk and superior extremities soon followed, but it took both time and force to extract the head. I quickly separated and removed placenta; all hæmorrhage ceased, and the mother is now rapidly recovering. Of course, the child was dead. I am, &c.

R. F. SNAPE.

Bolton-le-Moors, Lancashire, Nov. 14, 1859.

TREATMENT OF NÆVUS WITH COLLODION.

LETTER FROM MR. BROWNING.

[To the Editor of the Medical Times and Gazette.]

SIR,—I have lately employed collodion with marked success as an application for the cure of nævus. It is most applicable to nævi situate over bone, exerting in such cases a uniform pressure much more effectual and more readily applied than that produced by means of a disk of ivory or other similar substance adjusted by plaster and bandage,—at all times a cumbersome apparatus, and seldom effectual, from the almost insuperable difficulty experienced in thus maintaining continuous pressure for a sufficient length of time. The mode I adopt is to simply apply the collodion by means of a camel's-hair pencil daily. I subjoin a case or two in which this mode of treatment has been adopted with the best results.

A. M., aged 4 months. A few days after birth the nurse noticed a small red spot, situate over the anterior superior angle of the left parietal bone, which gradually enlarged until it had, when brought to me, attained the size of a sixpence. It was of a dark venous hue, prominent, and increased in size when the child cried. Collodion was freely applied each day for a week, and three times during the following week, when the crust thus formed becoming partially detached was entirely removed, and the collodion reapplied daily for a week, and occasionally during the following fortnight, with the effect of entirely removing all traces of the nævus.

E. J., aged 16 months, had a nævus over the right brow, which had been gradually growing larger since birth. When the case came under my notice it measured three-quarters of an inch in length, by half-an-inch in width, and was elevated considerably above the surface. Collodion was applied, as in the previous case with good result, a cure being effected in five or six weeks.

G. W., aged 8 months, was brought to me with a nævus as large as a shilling, situate over the left temple, and apparently connected intimately with the temporal artery. During the last three weeks it had rapidly increased in bulk, and was then prominent and pulsating. Collodion was applied daily at first, with the effect of only slightly reducing the size of the tumour. Under the protracted daily application, however, the nævus eventually disappeared entirely.

The result in this case, I think, tends to throw doubt on the supposition that there was any connexion of importance between the temporal artery and the nævus. The artery probably passed under the tumour, thus imparting to the latter its pulsation.

I would remark, that in no case have I found any evil

result from the free application of collodion to the surface, and, although in some instances a considerable time has elapsed (owing generally to the carelessness of parents) before any benefit has resulted, in no case where I have been able to apply it myself have I known it fail. The advantage over the painful ligature is obvious. I am, &c.

GEORGE BROWNING.

Oughtibridge, Sheffield, Oct. 24, 1859.

REPORTS OF SOCIETIES.

ROYAL MEDICAL AND CHIRURGICAL SOCIETY.

TUESDAY, NOVEMBER 8, 1859.

J. SKEY, Esq., President, in the Chair.

THIS was the first meeting of the Session. The attendance was very large.

A paper, by Mr. SOLLY, was read, giving

A CASE OF ANEURISM OF THE ABDOMINAL AORTA ARRESTED IN ITS PROGRESS.

On October 16, 1855, I was sent for by Captain W——, I found him a man of 30 years of age, and writhing in pain. I have seldom, indeed, seen indications of greater agony. He was naturally a handsome man; but his face was now thin and sallow, with an occasional transient flush. He referred his pain to the epigastric region of the abdomen; it was not much increased by manual pressure, but he could not lie flat on his back without additional suffering. A belladonna plaster over the epigastrium prevented my examining the abdomen satisfactorily. He stated that his bowels were confined, and the motions had been lumpy. I ordered him a dose of croton oil, and, as soon as the bowels had acted freely, a grain of morphia, with three drops of tincture of aconite in water every three hours. After I had thus prescribed, I learned that Dr. Watson had seen him previously, and I therefore, with their permission, made an appointment to meet him the next day. In the interval I made out the following history of his case, partly from his own account and that of his wife, and partly from a written statement by Dr. Gibney, of Cheltenham, under whose care he had been. At first I could not ascertain any probable exciting cause of his disease; but after some questioning, I found that four years and a-half previously he first suffered from pain in his abdomen when following the hounds on a young and very unruly horse. The violent exertion required at times to keep his seat caused a severe pain in the abdomen, and, as far as he can recollect, at the same spot in the abdomen as at present. When he arrived at home in the evening, this pain continued so acute as to oblige him to go to bed, instead of going out to dinner, as he had intended. From this account I am certain that the pain could have been of no ordinary character, as he is a most energetic and active man. Since that time he has never been thoroughly well. It was not, however, until years afterwards that he began to complain of his back, and indeed he says that he did not really suffer much until the last six months, when, the pains becoming more frequent, he consulted a celebrated London surgeon, who ordered him mercury with sarsaparilla, and friction to the back, telling him that he considered his affection spinal. These means seemed of some service; but on a hurried journey to Ireland all his bad symptoms returned. The pains extended through the abdomen to the back and chest. He had frequent nausea, and at times vomiting, and almost always pain in the stomach after food, solid or liquid. Dr. Gibney, when writing to me on the 18th of October, says—"When I first saw him on the 6th (twelve days ago), he had violent pains in the back, extending throughout the trunk of the body; his pulse was 92, of good strength, his tongue clean and bowels open. I tried to allay the irritation by hydrocyanic acid, and a pill of bismuth and morphia. This partially succeeded." Dr. Gibney in the same letter, intimates the probability of the case being one of aneurism of the coeliac axis, but without pronouncing a positive opinion. On the

19th I met Dr. Watson. Our patient was much relieved by the croton oil, which had acted freely, and he had had a good night's rest with the morphia. The belladonna plaster having been removed, I was able to examine the abdomen, which I did at Dr. Watson's request before he gave me his opinion. I found a distinct pulsating tumour a little above the umbilicus, at about the bifurcation of the aorta. This pulsation was felt not merely from behind forwards, but laterally also. This fact had also been observed by Dr. Watson on his previous examination, and to both of us it was the confirming point in the conclusion at which we arrived. On listening carefully, we could hear, both with and without the stethoscope, a distinct *bruit de soufflet*. I now felt no doubt that the tumour was an abdominal aneurism, and in this opinion Dr. Watson coincided, and added that it was almost the only case of many supposed cases of abdominal aneurism in which he could arrive positively at such a conclusion. He mentioned that Mr. —, who had seen the case with him on a previous occasion, differed from him, regarding it as a case of enlarged lumbar glands. The urine was examined by Mr. W. Tyrrell: "Pale, white sediment suspended in a small quantity of mucus, exhibiting under the microscope crystals of oxalate of lime." On the 29th of October, Mr. Leggatt, of William-street, Lowndes-square, residing within a few doors of Capt. W——, was called in, and has kindly favoured me with his notes. He says—"I found him with a violent pain in the back. He had taken a grain of morphia at bed-time, and fifteen minims of Battley's solution, without effect. I examined the abdomen, but could not satisfy myself of the existence of aneurism. The pulse was quick when I saw him, but it came down under the influence of chloric ether and small doses of Battley's solution." Three or four days after this date, when the bowels had been well emptied by purgatives, Mr. Leggatt satisfied himself of the existence of an aneurism. Nov. 7.—I found him in a state of extreme suffering; the pain referred more to the back than to the abdomen. I agreed, with Mr. Leggatt, to put him under chloroform, and having raised a blister by means of a heated iron spoon on either side of the lumbar vertebrae, opposite the seat of pain, to dress the raw surface with morphia. 9th.—The chloroform relieved his pain so entirely, that the blister was not dressed that night with morphia; but on the following day, the pain returning, recourse was had to the morphia with success. 10th.—Still suffering, though somewhat less. I now met Mr. Hester, of Oxford, an old friend of the family. He came to the same conclusion as ourselves, and agreed to the same palliative plans of treatment, suggesting also a little digitalis three times a day. 12th.—Dr. Todd met Mr. Leggatt and myself in consultation, and agreed that it was aneurism of the abdominal aorta. 19th.—Met Dr. Todd again. Captain W—— is suffering severely; is much altered and worn in appearance; has taken scarcely any food; has no appetite, and almost constant sickness. Ordered—creosote, one minim; disulphate of quinine, two grains: every six hours. A drachm of tincture of opium to be used in an injection. 20th.—Met Sir B. Brodie. Mr. Leggatt announced to us that he was now not able to feel any pulsation in the right iliac artery. Both Sir B. Brodie and I were satisfied of the correctness of this statement as regarded the artery in its passage over the pubis. I thought I could feel a slight pulsation at the saphenic opening. In the left iliac and femoral arteries the pulsation was distinct, though feeble, but the circulation generally was feeble. The sickness had been alleviated by the creosote and quinine. Sir B. Brodie agreed in the opinion that the disease was aneurism. 29th.—Improving; has been tolerably free from pain since my last visit; does not look so haggard, and has taken his food better; no sickness, except on the evening of his removal into his present house. He was removed in a Bath chair, the distance being about a quarter of a mile. He bore the journey well. The aneurism is smaller, and the pulsation less distinct; less distinct also in the left femoral artery, and no bruit perceptible. In the hope of increasing the coagulium in the sac, he was ordered—disulphate of quinine, two grains; dilute sulphuric acid, ten minims; alumen, ten grains; syrup of ginger, one drachm; compound infusion of roses, one ounce; twice a day. Dec. 3rd.—This medicine, griping him, was abandoned, and he returned to the quinine and creosote. 12th.—Decidedly improved; is gaining flesh; free from pain; sleeps well without any morphia, but continues the injection of tincture of opium (one drachm) every night. The pulse is

stronger, and a slight bruit may be heard in the aneurism; its size is, however, not so large as it was, and there is still no pulsation in the right iliac. Jan. 4th.—Varies. The pulse, becoming fuller and more forcible, has been restrained by a less stimulating diet and digitalis; this medicine has, however, been discontinued, as it reproduced the nausea and sickness. On examination to-day, I found the tumour rather more elongated, and the pulsation is again very distinct both from before to behind and laterally. The whirring sound is very distinct, and, in addition, I heard very distinctly a whistling sound, which Mr. Leggatt informs me he has heard on several former occasions. To continue the quinine and creosote, with a quarter of a grain of the sulphate of iron twice a day. 11th.—No change in the aneurism; his general health somewhat improved. Meeting Mr. Jolliffe Tufnell at St. Thomas's Hospital, and knowing the interest he took in such cases, and aware of the fact of his having had one such under his care in Dublin (which so far recovered that the patient, a car-driver, had pursued his employment for three years after leaving the Hospital), I proposed a consultation, which was readily agreed to. Mr. Tufnell coincided most fully in the opinion as to its aneurismal character, and suggested his being confined entirely to bed, and in the recumbent posture, as affording the best prospect of a recovery. To this I entirely agreed. When I first saw him, his health was so impaired that I feared lest absolute confinement might prove injurious; but his general health having now improved, I had no hesitation in adopting this plan; and it had this additional reason in its favour, that with the improvement in his health the local pulsation had also increased, as well as the size of the tumour and the distinctness of the bruit. 12th.—I have procured a sofa for him, with a rack movement that will permit of some little alleviation of position without any exertion on his part. To have only four ounces of meat, eight ounces of bread, fruit and vegetables, of each three ounces, and twenty four ounces of water or tea in all; but no stimulants. Feb. 6th.—Tumour rather larger; pulsation the same; radial pulse not so full. April 20th.—He has continued in much the same state since the last date; his general health good, and free from pain. He has now submitted to the starving plan, and entire rest for nine weeks. He is desirous of leaving London. I have, therefore, consented to his getting up from the sofa, but still to keep very quiet. 28th.—I have again examined the aneurism; the pulsation is not so distinct, but it is more diffused, and extends more in the direction of the right groin; the bruit is not so clear, but can be heard almost as low as Poupart's ligament. He is very weak, and disinclined for walking; he sleeps well without the opium at night; his appetite moderate; his diet still spare. He leaves town to-morrow for Dover. He bore the journey well, and I placed him under the care of Mr. Sankey and Dr. Barton. May 9th.—Mr. Sankey writes me: "You will be pleased to hear that Captain W— is progressing favourably, and that Nature is performing a cure no operation could have done." May 25th.—Mr. Sankey again writes: "I yesterday made a most careful examination of Captain W—, the result as follows:—Pulse 72; tongue clean; bowels acting daily; urine deposits a pink sediment. As to the aneurism, I can scarcely detect any pulsation below the umbilicus, and none in the external iliac or femoral arteries. I have strenuously advocated the most rigid adherence to your directions as to diet, quiet," etc. June 2nd.—Going on favourably. Report from Dr. Barton: "*Bruit de soufflet* distinct over a space of about two inches in diameter, being more marked half an inch to the right of the umbilicus. At this spot impulse is also perceptible, but not elsewhere." The following account is from a relative who was then with him, dated June 5th:—"He seems much the same as when I last wrote to you; dreadfully exhausted and weak in the day, although he gets pretty good nights, taking the enema, with thirty drops of laudanum in it. He continues the aconite pills and the creosote, three times a day, and twice a day is taking two tablespoonfuls of quinine mixture. There is constant nausea and vomiting every other day, and sometimes oftener. He takes very little nourishment during the day, but enjoys his cup of bread-and-milk for supper, and again in the night, better than anything else; he has the lime-water in it, as in London. He has not had a fresh blister on since Thursday, and then on his stomach. Dr. Barton thought that if he could possibly do without the blisters so much the better, as of course they must weaken him; and now, when he feels any

slight pain in his back, he has an enema, with fifteen drops of laudanum." On the 10th of June I received a note asking if he might have a little table-beer. Up to this time the abstemious system had been pretty fully carried out; it was now a little relaxed. June 15th.—Is gaining strength; goes out every day, but does not use much exertion. July 9th.—I was summoned hastily to Dover, on account of the intense suffering he was enduring. I found him in the same agony as when I first saw him. It appears that after the date of the last report, he was persuaded to accompany Lord Y— in his yacht on a cruise to Lymington. Here he walked for about half a mile, which was more than he had ever attempted at Dover, and from that time to the present the pain gradually increased until it attained its present intensity. The treatment which had been adopted in London with perfect success in relieving the pain—viz., chloroform, blistered surface dressed with morphia, and opium injections—had been again tried before my arrival, but with only temporary relief. On examination, I found that the tumour was decidedly smaller, the pulsation much less distinct, and the bruit fainter; withal, his radial pulse was stronger, he had gained flesh, his appearance was healthy, and his muscles were firm. Under these circumstances, I advised venesection to six ounces. He bore the bleeding well; no feeling of faintness followed, the pulse became softer, and for a time he was decidedly relieved. The blood, on the next morning, exhibited a firm coagulum, slightly cupped and buffed. The pain and sickness had now returned; I accordingly recommended a strong aperient, and a blister on the abdominal surface of the tumour to be dressed with morphia. On July 12th, I received the following from Dr. Barton:—"After applying the morphia to the blistered surface, Captain W— had a very tolerable night, with a good deal of sleep at intervals, and this freedom from pain continued until about three o'clock this afternoon, when it again returned, but not so severely. He has taken very little food, as his stomach is irritable, and he has vomited twice. The bowels have been very obstinate; but, after taking six pills, and having had two injections administered, they acted twice. His tongue is still white, and he complains of thirst. He has taken the aconite pill you prescribed three times a day." I did not hear of him again until the 25th, when Dr. Barton writes: "On Tuesday last he had a great deal of pain and sickness. The latter was relieved by the creosote pills you advised, but the pain was very severe and obstinate. The endermic application of the morphia affords him more certain relief than any other anodyne. His tongue is cleaner, and his appetite is returning, but the bowels continue obstinate. I examined the aneurism to-day with the stethoscope; both pulsation and bruit are more distinct on the left side than they were, and less on the right." Dr. Barton writes again on August 23rd.—"About a fortnight since, I thought the pulsation decidedly greater and the bruit heard over a larger space; to-day, I thought it less distinct. He has had no severe pain for some time past, but complains of great weakness in his back; he has no sickness, and his appetite and general health are better. He intends to leave here on Wednesday *via* London for Cheltenham, so that you will have an opportunity of judging for yourself." As thus intimated, I saw Captain W— on his return from Dover, Sept. 5th, 1856. I found him free from pain; pulse 86, rather jerking, not very full; the form of the tumour less defined, and the *bruit de soufflet* less distinct. He was not taking any medicine but the thirty drops of tincture of opium at night and fifteen at noon, and one glass of wine. From this date I never saw my patient again; he consulted, I believe, before he left London, two celebrated Surgeons and one Physician, who told him he had no aneurism. He also, on different occasions, consulted three of the Dublin Surgeons, and among them one whose name may be mentioned, as he is now no more—Sir Philip Crampton: they all told him he had no aneurism, and that he might act as he liked with respect to diet, exercise, etc. On January 23, 1859, I received a note from Dr. Gibney, of Cheltenham, in which he says:—"I am sorry I can tell you nothing satisfactory of Captain W—; indeed, to tell you the truth, he says that you, myself, Dr. Watson, and Mr. Tufnell, entirely mistook his case. Nay, on meeting him the other day, I said, 'Well, Captain W—, how is the tumour?' 'There never was a tumour,' said he, rather rudely. 'Oh! Mr. Solly, Dr. Watson, and myself, felt it; it was as large as the top of my walking-stick.' 'Ah! but Mr. — said there was no aneu-

rism.'” The consequence was that he recommenced his hunting, driving four-in-hand, etc.; and thus he continued, until the poor fellow died suddenly at Cowes, on the 8th of August last—just three years from the time when he ceased to consult me. This event fortunately occurred when he was under the care of Dr. Hoffmeister, of Cowes, who, with Dr. Cass, made a post-mortem examination. Dr. Hoffmeister says:—“I had been attending Captain W— for a week previously, during the whole of which time he had been suffering from very severe pain in the back and abdomen; there was marked abdominal pulsation, with a loud bellows murmur; he was occasionally soothed by opiates and chloroform. On my visiting him on Monday, just after noon, I found him pallid and dying. It appeared that the bowels having acted, he lay down in bed, and immediately afterwards called out from the agony of the pain, and suddenly became deadly pale and faint. I was with him in about five minutes, and he lingered till nearly one o’clock.” “The cause of Capt. W—’s death,” says Dr. Hoffmeister, “was, on post-mortem examination, found to have been the bursting of an aneurism of the abdominal aorta, immediately above its bifurcation, nearly four inches in length, and between two and three in breadth, the rupture taking place by a small opening at the back part of the aneurism, a little to the inner side, and just above the origin of the left iliac artery. The coats of the aneurism, at the lower part, were plated with ossific deposits, and there were also fibrinous deposits. The cellular tissue behind the viscera was very extensively infiltrated with coagulated blood. Vertebra not diseased. I cannot help thinking that if this poor fellow had led a quiet life in every respect—in fact, had pursued the same plans by which the character of the aneurism was so much altered that eminent Medical men doubted its existence—he might have lived many years; that the sac might have become firmly consolidated, its cavity obliterated, and the fatal termination averted.”

Mr. JOHN ADAMS thought the subject one of great interest. He regretted that when the disease was first discovered in the patient, Valsalva’s mode of treatment was not adopted—repeated small bleedings, absolute rest, the use of digitalis and those remedies which were calculated to diminish the heart’s action. In a case of aortic aneurism under his own observation, that method had been adopted with undoubted success. The tumour had subsided to the level of the surface of the stomach, but he could not say that the disease was cured. In another case, after twenty or thirty small bleedings, the aneurism became closed, and a cure was established. The patient, however, died suddenly from an affection of the brain, possibly consequent on the cure of the aneurism. It often happened in cases of abdominal aneurism, which terminated fatally by rupture, that blood was found, not in the abdomen, but in the cavity of the chest. He had seen three cases of that kind, in which the aneurism made its way through the posterior mediastinum, and burst into the left pleural cavity. One of the cases was that of a member of the Society, who, while tying a wounded artery, felt excruciating agony in his chest, and he died the same evening. A small aortic aneurism had made its way into the posterior mediastinum and entered the left pleura.

Mr. SOLLY said, that when he first saw the patient he was in so low a condition that bleeding would have been out of the question. Digitalis was used occasionally, but it had to be discontinued on account of the sickness it produced. The only medicine producing any direct control over the heart’s action was aconite, which was occasionally administered.

Mr. HOLMES COORE concurred in the propriety of the treatment pursued by Mr. Solly. As to Valsalva’s method, he had never seen it successfully adopted, and should be glad to know if any member had ever found it beneficial. He remembered a case some years ago in which an abdominal aneurism was partly controlled by depletion; but the patient died of phthisis; and Dr. Roupell was of opinion that he was destroyed by the plan adopted. No doubt there were some cases in which Nature herself effected a cure; but he was not aware of any case on record in which Valsalva’s method had proved perfectly successful.

In reply to the PRESIDENT, Mr. SOLLY said he believed the aneurism was not removed.

Dr. COPLAND said he had seen several cases of aneurism of the aorta. In one of these the patient, whom he saw in consultation with Mr. Stephens, of Oxford-street, was considerably improved by the method adopted, the elevation of the

ribs being much reduced. Valsalva’s mode was not tried, and the treatment was mainly rest, regulated diet, free action of the bowels, anodynes, and friction. He considered that a tonic treatment was most likely to effect a cure in cases of aneurism, and that Valsalva’s method could rarely be adopted with success.

Dr. CHAMBERS said that in 1853 he was consulted by a lady nearly sixty years of age, whom he found to be the subject of aneurism of the aorta at the origin of the subclavian artery, there being no pulse in the left wrist. He gave large doses of liquor potassæ three times a day, and continued the treatment for three months. The pulsation of the aneurism diminished, but the pulse at the wrist did not return. The patient went into the country, and continued the treatment. He did not again see her till 1858, when the aneurism was considerably diminished, and the pulse at the wrist could be felt. It appeared to him that the disease was in progress of cure, and that if the patient had been a young woman, a modified application of Valsalva’s treatment might have been quite successful. He took three ounces of blood twice during the first week, but instead of continuing the bleeding, he put the patient on a diminished diet, with meat only three times a week. Another case came under his care in St. Mary’s Hospital, that of a man about fifty years of age. He was bled twice a week, and put on low diet, and ordered to take liquor potassæ; and at the end of nine weeks, when he insisted on leaving the Hospital, the pulsation of the aneurism could not be felt, and the pain was very much diminished.

Mr. PRESCOTT HEWETT said that some years ago a man was admitted into St. George’s Hospital with a large aneurism at the upper part of the aorta. Valsalva’s treatment was not employed; the man, however, was kept perfectly quiet, and in the course of four or five months the carotid artery ceased to pulsate, and subsequently the pulse at the wrist ceased. The tumour became perfectly solid, and no pulsation was felt about the chest. The patient was afterwards admitted into two other Hospitals, where he was told positively that he had never had an aneurism. He lived four or five years, and ultimately returned to St. George’s Hospital, where he died of phthisis. On examining the body he (Mr. Hewett) found a very large aneurism, completely cured, which had occupied the upper part of the arch of the aorta; the carotid and axillary arteries being obliterated. He also found two other aneurisms,—one in the thoracic, and the other in the abdominal aorta, both of which were cured. He remembered seeing two cases of very large aneurisms in the thoracic aorta, which were perfectly cured by Nature.

Mr. LEGGATT said that when he first saw Mr. Solly’s patient he was in an extremely weak condition, as though he had been the subject of frequent bleedings, and been living on diminished diet; he also suffered extreme pain. By a tonic treatment, and rest, he improved rapidly; and had he continued the course recommended, and kept perfectly quiet, he (Mr. Leggatt) believed that the disease might have been cured.

Mr. HENRY THOMPSON thought that no satisfactory conclusion could be arrived at without ascertaining the history of the patient, his mode of life, etc. during the two or three years between his treatment by Mr. Solly and his death.

Mr. SOLLY said the patient was a reckless, free living man, fond of hunting and active exercise.

A paper, by ROBERT LEE, M.D., F.R.S., was read, entitled

A HISTORY OF AN ADDITIONAL CASE OF TUBAL GESTATION.

This case, which occurred in the practice of Mr. Gregory Forbes, was that of a woman, who, having menstruated profusely a month before her death, was seized with pain in the abdomen, on the 8th of October, followed by complete prostration. She died the following morning. On examination of the body, three pints of blood were found in the cavity of the abdomen, which had escaped from an opening in the left Fallopian tube, where an ovum had been developed. The embryo was not found at the time of the post-mortem, nor was the amnion or vesicula umbilicalis discovered; and there was no deciduum in the cavity of the uterus. The Fallopian tube and ovarium were alone permitted to be removed; and these were examined, under spirit, by Dr. Lee, who found a deciduous membrane adhering to the inner surface of the tube, and enclosing the villi and membrane of the chorion on all

sides. The hæmorrhage was evidently traceable to a rupture in the decidua and adhering portion of the tube, by which a communication was established between the cells of the villi of the chorion and placenta and the sac of the peritoneum, through which the blood flowed from the cells of the chorion into the abdominal cavity.

Dr. BARCLAY, in the absence of the author, said he believed it was the object of Dr. Lee to confirm the statement he had made before the Society last session, that in cases of tubal gestation the deciduum was found in the Fallopian tube, and not in the uterus.

A paper, by HOLMES COOTE, Esq., was read, giving

A CASE OF DOUBLE CLUB-FOOT (TALIPES VARUS) AND CLUB-HAND IN THE SAME INFANT.

The author read the particulars of a case of double club-foot and club-hand in the same infant. He remarked that such an occurrence was very rare, no similar specimen existing in the museum of the Royal Orthopædic Hospital. There were cases on record in which both hands and feet were congenitally deformed; but in the present instance there was only displacement, the component parts of the hands being as perfect as were those of the feet in their abnormal position. He added some remarks upon the difference between deformities caused by arrest of development and displacements or alterations in form from mechanical pressure. He argued that club-foot, in its usual congenital form, was due to pressure during intra-uterine life. Some preparations of deformity were exhibited.

Mr. WILLIAM ADAMS was surprised to find the case brought forward in support of the theory that such deformities were produced by pressure *in utero*, for if any class of cases told against that theory it was that class in which several parts of the body were found to be deformed. Such cases, in his opinion, rather favoured the view advocated by Dr. Little, that the deformities were due to dynamic causes, more or less through the nervous system. The worst case that had ever come under his care was that of a child born with two club-feet, two club-hands, two contracted knees, two contracted hips, two contracted elbows, and a contracted neck. Severe cases, in which several parts were implicated, could often be traced to an accident between the third and fourth month of pregnancy.

Dr. LITTLE said that cases of double club-foot and double club-hand in the same individual were not so rare as might be supposed from the circumstances that the museum of the Orthopædic Hospital did not contain a single specimen. The museum in Berlin contained at least a dozen fœtuses illustrating that peculiarity. The oldest theory was, that pressure *in utero* was capable of producing such affections; but he thought that extended observations showed distinctly that deformities, both before and after birth, arose from a great variety of causes; that almost every cause of deformity which might occur after birth occasionally occurred *in utero*. Considering the symmetrical character of the affections, their number and variety, and the early period at which they occurred, when the proportion of the liquor amnii to the fœtus was so large, he had no doubt that congenital cases often resulted from causes operating on the nervous system of the child through that of the parent, or through accidental injury to the parent at an early period of gestation. He had seen cases explicable only by the malposition of the limbs in the uterus; but he believed such cases to be exceedingly rare. One important class of cases, clearly referable to accidental injury, consisted of those in which the child was found with limbs variously contorted or deformed in consequence of knotting of the funis. As to the treatment of club-hand, it was difficult to lay down any absolute plan. Considering the identity of cause in club-hand and club-foot, there was no ground, unless the hand was extremely deficient, to despair of effecting much good by treatment. He had frequently done good by tenotomy and mechanical treatment.

Mr. HOLMES COOTE reiterated the opinion expressed in his paper that the deformities in question were the result of pressure *in utero*. It did not appear to him extraordinary that all the extremities should occasionally be subject to the same kind of pressure. If it were possible for anything like an impression upon the mother, or a casual accident to have any great effect on the development of the fœtus, deformities would be much more frequent than they are.

The Society then adjourned.

OBITUARY.

BIRMINGHAM has lately lost a great Medical ornament by the death of William Dufton, Esq., in the prime of life, from fatty and dilated heart. This gentleman was a native of Cumberland, being a younger son of the late John Dufton, of Brigham, and commenced his professional career under the guidance of the Messrs. Dickenson, long known as eminent practitioners in the neighbourhood of Cockermouth. He subsequently studied at the Borough Hospitals, and at Jervis-street Hospital, Dublin, where he particularly attached himself to that excellent Surgeon, Mr. Kirby, who ever took the most lively interest in the welfare of Mr. Dufton. He entered upon practice in the town which now laments his loss in the year 1831, and soon obtained success in general practice. From the beginning of his career he appears to have attended specially to Diseases of the Ear; and in 1844 published a little work on the "Nature and Treatment of Deafness," which obtained, as it deserved, the marked praise of some of the leading Medical journals. He then established the Institution for the Relief of Deafness, and became its sole Medical officer. Its success was complete, and it has been the means of extending relief to many sufferers from a sad affliction. Mr. Dufton soon became the chief Consulting Practitioner in the Midland district for these disorders, and was beginning to reap the fruits of his industry and ability when Death cut short alike his active benevolence and his professional success. The private character of this esteemed member of our Profession was beyond reproach. His life was consistently good and honourable—for his actions were guided by a profound appreciation of Christian principles. The words of the learned Rev. J. B. Marsden, in preaching his funeral sermon, are no exaggeration:—"His patients saw not only Professional skill, but high integrity, based upon Christian principle. All who knew him felt his influence. The town feels and laments his loss: he was a public benefactor. His long course,—manly, upright, disinterested,—had won the hearts of all who knew him."

We have the painful duty to record the demise of W. Rumsey Williams, Esq., of Carnarvon, which took place at Llanberis, on November the 3rd. The late Mr. Williams was generally considered one of the most successful Obstetric Practitioners in North Wales. In the course of the twenty-five years he practised in the town of Carnarvon, he attended upwards of 4000 midwifery cases, in addition to a very extensive general practice. The loss of this energetic and devoted gentleman will be deeply felt by the inhabitants of the town and neighbouring country. His pleasing and gentlemanly manners gained the estimation of all his acquaintances; he was likewise regarded as a kind and charitable friend by his patients. Mr. Williams' generous and compassionate disposition to the poor in distress, sorrow, and exigency will be ever remembered with deep gratitude. His life has been sullied by no single act capable of calling down censure or reproof. Mr. Williams' health had been declining for some time, and in consequence he retired from private practice, and accepted the Surgeonship to the Llanberis Hospital for £500 a-year. No sooner had he commenced to enjoy a little repose and tranquillity after a toilsome and laborious life, than he was summoned away. His funeral was attended by the Mayor and Town Council of Carnarvon. The public received permission to show their last tribute of respect by accompanying the procession. Hundreds of the late gentleman's patients were seen weeping bitterly on witnessing the last melancholy and mournful scene in the churchyard. He left an affectionate wife and family to lament their irreparable loss.

We have also to record the demise of Sir F. S. Darwin, Kt. M.D., which occurred at Breadsall Priory, Derby, on Sunday last, in the seventy-sixth year of his age. The deceased was son of the late eminent Dr. E. Darwin, and was descended from the Darwins of Cleatham, Lincolnshire. He was educated at Repton and Cambridge, graduated M.D. at Edinburgh, was a Deputy-lieutenant for Derbyshire, practised as Physician at Lichfield for many years, and received the honour of knighthood on presenting an address from the inhabitants of that place to his Sovereign, in 1820.

MEDICAL NEWS.

APOTHECARIES' HALL.—Names of gentlemen who passed their Examination in the Science and Practice of Medicine, and received Certificates to Practise, on Thursday, the 10th November :—

GREENE, JOHN, Sedgley, Staffordshire
SIMMONS, BENJAMIN, Taunton College
WILLIS, WILLIAM, Ebniskillen

The following gentlemen also on the same day passed their First Examination :—

FARRANT, SAMUEL, Collumpton, Devon
MARCH, HENRY COLLEY, Newbury, Berks

The following Gentlemen passed their examination in Classics and Mathematics on Tuesday and Wednesday, November 15 and 16 :—

BRYANT, WILLIAM HICKS, Plymouth
COLQUHOUN, FREDERICK STUART, Gold-street, Taunton, Devon
ECK, VINCENT FREDERICK, Holborn
ENSOR, ALFRED, Dorchester
FRY, AUGUSTIN BARBER, Sleaford
FLCIDER, ARTHUR EISEDELL, Lymington
GARGORY, CALEB, Harley-street
HAYMAN, PHILIP CHARLES, Perram, Axminster
LAMB, GEORGE, Arbour-square, Stepney
LATTEY, JAMES, Warming-ton-terrace
LOW, ALEXANDER JAMES, Le Cairns, St. Balades, Jersey
OWEN, DAVID CHARLES LLOYD, Wakefield
PALMER, CLEMENT, Beccles, Suffolk
RENTON, GEORGE, Sunderland
ROBERTS, JOHN, Kidwelly, Carmarthenshire
SMITH, THOMAS HAYWOOD, Alcester
THOMAS, ROBERT WRENTMORE, Bristol
WARREN, THOMAS, jun., Princes Risboro'
WATSON, GEORGE SAMUEL, Hammersmith, Middlesex
WAUGH, ALEX., Bristol
WAYMOUTH, ALBERT, Devonport
WILLS, CHARLES, NARBOROUGH
WEITBRECHT, JOHN HENRY MARTIN, King's College
WELBY, WM. MONTAGUE HALL, Burton-crescent

At a Congregation held October 27, the degree of Doctor of Medicine was conferred upon D. H. Hodgkinson, M.A., of Trinity College, Cambridge.

At a stated meeting of the King and Queen's College of Physicians, Ireland, held on the 31st October, William Moore, M.B., M.R.I.A., was unanimously elected a Fellow of the said College.

APPOINTMENTS.

ALISON.—Dr. Scott Alison has been appointed Physician to the Consumption Hospital at Brompton, in the place of Dr. T. Thompson, resigned.
BARRITT.—Dr. Thomas Barrett was elected Mayor of Bath on Nov. 9.
COLLINGWOOD.—Dr. Cuthbert Collingwood has been appointed Physician to the Northern Hospital, Liverpool, on the election of Dr. Inman to the Royal Infirmary.
ROGERS.—Dr. Rogers has been appointed Physician for out-Patients to the Samaritan Hospital, in the place of Dr. Graily Hewitt, resigned.

DEATHS.

COVENTRY.—Nov. 12, at Cheltenham, of pulmonary consumption, John Coventry, Esq., M.R.C.S., L.A.C., House-Surgeon to the Cheltenham Poor Law Union, aged 42.
FLEMING.—Nov. 3, at No. 6, Haddington-place, Edinburgh, Dr. Frederick Fleming, late of the H.E.I.C.S.
HINE.—Nov. 9, suddenly, at Ripley, Derbyshire, Daniel Benjamin Hine, M.R.C.S. Eng. 1854; L.M. 1854; L.S.A. 1856, aged 30.
HORLOCK.—Nov. 10, at Thorwell, Isle of Wight, Robert Horlock, M.R.C.S. Eng. 1849; L.S.A. Lond. 1843.
HUNT.—Sept. 7, at Williamstown, Victoria, Thomas Hunt, Surgeon.
McCULLOCH.—October 31, at 44, Connaught-terrace, Hyde-park, London, after a long illness, George McCulloch, Esq., M.D., Staff Surgeon, late of the 5th Dragoon Guards.
PRITCHARD.—November 9, at his house, Stratford-on-Avon, Frederick Pritchard, M.R.C.S. England, 1836; L.S.A. London, 1836, aged 53.
REID.—November 10, at Albion-place, Belfast, Edward Reid, M.D., Assistant-Surgeon, of H.M.S. *Brunswick*.
STODDART.—November 9, at the Royal Naval Hospital, Plymouth, suddenly, James F. Stoddart, Assistant-Surgeon, R.N.
SYLVESTER.—November 7, by railway accident, Thomas Sylvester, of Highbridge, Somersetshire, L.S.A. 1820, aged 60.
WANSBROUGH.—November 9, Thomas William Wansbrough, Esq., M.D. and F.R.C.S.E., in his 72nd year.

UNIVERSITY COLLEGE HOSPITAL this year laments that its expenditure exceeds its receipts by £500. Mr. Hibbert has given to it a sixth donation of £100.

THE ASYLUM FOR IDIOTS has netted upwards of £1000 through a bazaar, conducted by the ladies of Brighton.

ONE of the Messrs. Fowler, of New York—a firm whose physiological motto is "Natural waists or no wives"—has been lecturing with success in Montreal, on the science of phrenology.

UNDER the patronage of the French Local Government, Dr. Pietra Santa, of Algiers, has produced a Medical work showing that residence to be better fitted for pulmonary patients than either Nice, Pisa, or Madeira.

THE following hint is worthy the attention of the Medical and Legal alumni of our country :—"Four hundred Law and Medical students at Madrid have applied for permission to enrol themselves in a volunteer battalion."

THE ANAGRAM OF RUDIGER.—The anagram of the words "Andreas Rudigerus," composed by himself while a student, is as follows :—"Arare rus Dei signus"—"You were intended for medicine," said Thomasius, "*rus Dei*," is the cemetery.

A NEW PLASTER.—M. Pasquier, of Roubaix, has exhibited to the Academy leaves of gutta-percha mixed with peroxide of iron, which he has long employed in the dressing of fractures and complicated wounds. The leaves soften in boiling water, and may be then readily applied around the limb, around which they become moulded, and lose none of their consistence through the heat of the body. After amputations he uses nothing but this gutta-percha,—neither charpie, compress, or bandage.

PRIZE QUESTION.—The *Société Medico-Pratique de Paris* offers a prize of 500 francs for the best essay on Eczema—the history, etiology, and especially the treatment of the affection being dwelt upon, and the statements made being supported by numerous and well-observed cases. The successful author, provided his essay does not exceed three sheets in length, will have a right to 100 copies, and it will also be inserted in the Bulletin of the Society. The essays, written in Latin or French, must be sent to M. Martin, Hotel de Ville, Paris, before December 31, 1861.

MEDICAL REGISTRATION.—On Thursday, November 10, A general meeting of the Medical Profession practising in Bath and Bristol, and the adjacent districts, was held at Bristol. Dr. Davey, was unanimously chosen chairman. It was decided—"That the name of the Society be the 'Bristol and Bath Medical Registration Association,' and that the district belonging thereto comprise an area of fifteen miles round Bristol and Bath respectively, as well as the towns of Wells, Shepton Mallet, Weston-super-Mare, Warminster, Swindon, Devizes, and their vicinities." Dr. Symonds was elected President for the ensuing year.

"PARASITES," writes M. Bazin, "play a triple rôle of cause, symptom, and lesion. They become a cause in determining physical lesions, as in the furrow formed by itch, or in its provoking, at a certain period of its existence, different cutaneous eruptions. Parasites are also symptoms. Does not the achorion, in fact, constitute the little cups of favus? They play the part of lesions also, by union with the cutaneous elements which they have affected, or with the morbid products whose formation they have caused." M. Bazin is no believer in spontaneous generation. "Parasites always come from without, and spring from beings like themselves."

MEDICAL PHILOSOPHY.—"The Physician should be a philosopher," wrote the Old Man of Cos, "and Galen repeated the sentiment, as have done also all great Physicians of all ages of the world. The difficulty is in knowing after what fashion he should become philosophic, or rather what sort of philosophy he should pursue and practice. From Hippocrates down to Barthez and Broussais, and M.M. Gibert and Bouillaud (who have lately indulged in a philosophic passage of arms,) through Helvetius, Stahl, Van Helmont, Baglivi, Fernel, and the rest; Heavens! how many philosophies have we not had! And which is the true one?"—*L'Union Médicale*.

CEYLON with its natural or physical marvels,—“Flowers, plants, and trees—which make it a sort of gigantic, lustrous botanical garden. Strange mountain-peaks upheaved in its southern portion, and palm-shadowed towns, nestling under trees; and grotesque temples, carved out of the boulder-like blocks. The mammalia in its woods; the fish which climb

trees; the leeches which go roving about in quest of fat-ancled travellers; the tritonise which tinkle musically under the water of the lakes; the pearls which make the north-west 'a sea of gain;' or the infusoria which tinge with vermillion a mile or two of sea—not to speak of ancient native works, magnificent tanks, and lakes, and canals—these are marvels of later time, etc."—*Athenæum*.

THE LOCAL GOVERNMENT ACT.—The General Board of Health established by the Public Health Act of 1848, expired by operation of the General Board of Health Continuance Act of 1857 on the 1st of September, 1858. The functions hitherto exercised by that Board are now divided. Those of them which have been continued by the Local Government Act, 1858, in relation to the acquisition or exercise of powers of local government, are transferred to the Home Department; those which related to sanitary matters proper, such as the issuing of regulations and directions in periods of epidemic disease, and the institution of sanitary inquiries, are transferred to the Privy Council with a medical officer acting under it. The new Act came into force from the 1st September, 1858, in districts under the Public Health Act, 1848.

LIVERPOOL MEDICAL REGISTRATION ASSOCIATION.—A general meeting of the members of this Association was held at the Medical Institution, Mount-pleasant, on Wednesday, the 9th of November, at 7 p.m. The chair was taken by Ellis Jones, Esq., President of the Association. About forty Medical men were present. The honorary Secretary read the report of the Provisional Committee. Dr. Vose proposed, and Mr. Desmond seconded, a resolution,—"That the report now read be received," which was carried unanimously. On the motion of Mr. Godden, seconded by Mr. Mather, the following gentlemen were appointed the office-bearers and committee for the ensuing year:—*President*—Ellis Jones, Esq. *Vice-Presidents*—Edward Batty, Esq., John P. Halton, Esq., John Macnaught, M.D., James Vose, M.D. *Honorary Secretary and Treasurer*—Arthur B. Steele, Esq. *Committee*—R. Y. Ackerley, Esq., Henry Anderton, Esq., Wavertree; E. R. Bickersteth, Esq., T. Bickerton, Esq., L. E. Desmond, Esq., Joseph Dickinson, M.D., King Ellison, Esq., Joseph Godden, Esq., Birkenhead; W. H. Manifold, Esq., W. M'Cheane, Esq., Hugh Neill, Esq., John O'Bryen, M.D., David Pater-son, Esq., Edward Parke, Esq. (West Derby), Henry Pritchard, Esq. (Fairfield), A. R. Stookes, M.D., James Turnbull, M.D., A. T. H. Waters, M.R.C.P. A vote of thanks to the Chairman concluded the proceedings.

REMARKABLE VARIATION IN TEMPERATURE AND ITS CAUSE ACCORDING TO MR. LOWE.—"During October we have experienced alike excessive heat and cold. The heat on the 4th was such that the records of the past forty-four years afford no parallel; the cold on the 24th (as I stated in the *Times* of the 25th) has been unequalled during the same period, except in 1836; on no occasion has it been recorded that such vicissitudes as we have lately felt (I fear I ought to say suffered from) have occurred in one month. During the past six months we have had four striking cases of unseasonable temperature. On April the 1st we had a minimum of 24·6, an excessively rare degree of cold for that month; but on the 7th the temperature ran up to 78·5, almost as remarkable as an instance of heat. In the present month we have had the enormous range of 54·3 (30·9–26·6). To this list I may add that the mean temperature of July was higher than had ever, in any month of any year, been recorded. These extreme variations have been supposed to be connected with the prevalence of solar spots, and the accompanying phenomenon of aurora borealis. That such a connexion exists is, I think, highly probable; but I would ask whether an additional explanation may not be found in the extreme sensitiveness which characterises our modern instruments."

SANGUINEOUS TUMOURS OF THE EAR.—The subject of sanguineous tumours in the pavilion of the ear of the insane has lately excited some attention in France. The following are the results brought on in a long dissertation by M. A. Foville:—1. Sanguineous tumours of this kind are formed of blood which is effused, not under the skin, but under the perichondrium detached from the cartilage. 2. The perichondrium thus detached, gradually contracts on itself as the effused blood undergoes absorption, and it drags with other portions of the pavilion, thus causing

the deformity which is consequent upon these tumours. 3. The perichondrium exudes on its internal surface a cartilage of new formation, which forms sometimes, a layer uniform over its surface, sometimes little islets separate one from the other. These productions are the cause of the thickening of the ears, which are the seat of these tumours. 4. The formation of these sanguineous tumours of the pavilion of the ear are generally preceded and accompanied with general disturbance of the cerebral circulation; and it is worthy of remark that the increase of redness, of heat, and of sensibility, observed in these cases, resembles, in a striking manner, what is observed in animals in whom the grand sympathetic has been divided in the neck, or whose superior cervicle ganglion has been removed.

PUBLIC BENEVOLENCE.—A noteworthy occurrence took place at Birmingham on Sunday last. The General Hospital in that town is known to be the noblest charitable institution in the midland counties. Situate in the midst of a dense population, the calls upon its resources are daily and rapidly increasing. One source of its income—the profits arising from the triennial festival—has fallen off of late. The proceeds of the festival have been large, but the expenses are of necessity more disproportioned to the receipts than they formerly were. The consequence has been, that the surplus for the Hospital has been comparatively small; and a few weeks since it was announced that the Hospital was between 3000*l.* and 4000*l.* in debt. The sale of funded property was discouraged by the governors, and the restriction of the means of usefulness of the Hospital appeared for the moment to be inevitable. But a few weeks since, Dr. Miller, the rector of the parish, suggested that a particular Sunday should be set apart for a general collection at every church and chapel in the town, and such places in the neighbourhood where the clergy might concur in the movement. The suggestion was immediately and cordially responded to, without any exception whatever. Churchman, Dissenter, Roman Catholic, and Jew, alike concurred in the good Doctor's plan; and yesterday was fixed for the collection, which was made in all the churches and chapels at every service; the result exceeded the most sanguine expectations. So far as was known up to this afternoon the amount will, it is anticipated, reach 3500*l.* The Jews held a special service; Dr. Baar, of Liverpool, preached; and 105*l.* was collected.

MEDICAL QUALIFICATION.—The Manchester city magistrates were occupied on the 8th inst. in listening to legal arguments in connexion with the Medical Registration Act, the 21st and 22nd Vic., cap. 90. A summons had been taken out at the instance of the Medical Ethical Society, against Mr. J. Healey, Rochdale-road, for holding himself forth to the public as a Surgeon, without being registered. Mr. Healey was before the court a few months ago, but the prosecution against him was withdrawn on his undertaking to alter his sign so as to omit the word "Surgeon." He had then no legal assistance, and having subsequently been advised that the prosecution could not be sustained, he made no alteration in the sign, and was now again summoned. Mr. R. B. B. Cobbett appeared in support of the summons, and Mr. Torr, barrister, represented the defendant. Mr. Cobbett said that by one clause of the Act it was stated to be expedient that persons requiring Medical aid should be able to distinguish a qualified from an unqualified Practitioner; by another section (the 15th) persons practising were to be registered; by the 40th section, penalties were imposed on any person who should wilfully or falsely pretend to be, or take and use the name of Surgeon, or any name implying that he was registered under the Act. The defendant used the name of Surgeon, and was not registered. Mr. Torr admitted that the defendant was not registered, but contended that the Act did not apply to him. The 40th section (that under which he was summoned) was for "wilfully and falsely" pretending that he was a Surgeon; whereas his client had two diplomas (produced), and had been a Practitioner for many years; his abilities were not denied. Mr. Maude said the magistrates could not constitute themselves a court of examiners into the degree of Medical qualification which a man might possess. The words "wilfully and falsely" merely meant something contrary to the Act. A penalty of £5 must be imposed, and the defendant might, if he desired, have a case for decision by another tribunal.—*Manchester Examiner and Times*, November 9, 1859.

VITAL STATISTICS OF LONDON.

Week ending Saturday, November 12, 1859.

BIRTHS.

Births of Boys, 918; Girls, 930; Total, 1848.

TO CORRESPONDENTS.

A Lecture, by Dr. West, on "Sudden Death in Infancy and Childhood," will appear in an early number.

Dr. McShane.—Many thanks.

Dr. Adams, Banchory.—Paper received.

Dr. Habershon's paper shall appear in an early number.

The letter of Emeritus on the Indian Medical Service shall appear next week.

L.S.A.—"Licentiate of the Apothecaries' Company," is the only title legally conferred by the Hall.

Mr. Jackson.—Mr. Maysmor, the Author of the "Medical Baronetage," lives at Park-villas, Regent's-Park.

Mr. Robinson will obtain all the particulars he requires by a letter to the Secretary of the Foundling Hospital.

M.R.C.S.—The question of the right of Physicians to practise Surgery is very fully discussed in our last Students' number.

L.R.C.P. Edin. by Examination.—is fully justified in styling himself *Physician*; probably the Medical Council will express an opinion how far he is justified in calling himself *Doctor*.

ERRATA.—P. 496, No. 489,—"Civitas" begs to render his communication more intelligible by the following emendation:—"This is not a hypothetical case, but I know an actual instance where a Practitioner of the *irregular* nature above described, claims that all letters which arrive in his town *simply* addressed 'Dr. Blank, Blank-town' shall be forwarded by the Post-office authorities to his residence, while there at the same time is resident in Blank-town a *regular and registered* Practitioner of the name of 'Dr. Blank,' but junior in point of residence to the false 'Dr. Blank.'"

P. 404, No. 486, for "the tusks of the elephant are found upon a pulp," read "formed."

TRACHEOTOMY.

TO THE EDITOR OF THE MEDICAL TIMES AND GAZETTE.

SIR,—You will find the case of ruptured trachea alluded to in your Journal of Nov. 5, p. 458; fully reported by me in the *Medical Times and Gazette* of July 26, 1856, p. 91. I am, &c.

JAMES LONG,

November 15, 1859.

Surgeon to the Liverpool Royal Infirmary.

TREATMENT OF WARTS.

TO THE EDITOR OF THE MEDICAL TIMES AND GAZETTE.

SIR,—Some four weeks ago, I inquired, through the medium of your valuable paper for a remedy for the annihilation of a crop of inveterate warts on the hand. In reply to my question several gentlemen came forward and suggested various remedies. I was at a loss—I did not know which to choose; but on reflection I resolved to commence with the first,

viz., "Aliquis," and to my great delight I found his suggestions answer most admirably. To him, and the other gentlemen who have so cordially and courteously condescended to reply to my note, I tender my most sincere thanks. I am, &c.

November 2, 1859.

CONSTANT READER.

DR BARKER AND MR. CHAVASSE.

TO THE EDITOR OF THE MEDICAL TIMES AND GAZETTE.

SIR,—Immediately on my return from the Continent I informed Mr. Chavasse that two letters had been sent by a solicitor; and wished to know if he had, or had not, given the purported instructions. At the same time I bitterly complained of the letter sent to Mrs. Barker. His reply was distinctly in the affirmative.

If he had then stated that the letter to Mrs. Barker was written without his knowledge, and more especially if he had expressed the slightest regret on account of that letter, I am quite certain that this unpleasant correspondence would never have occurred.

Allow me to state, sir, in conclusion, that Mr. Chavasse's expression of regret in regard to that letter, has very considerably changed my feeling towards him. In return, I beg to express my own regret for anything on my part which has been annoying to himself. I am, &c.

Bedford, November 14, 1859.

T. HERBERT BARKER, M.D.

AMPUTATION OF THE PENIS BY THE ÉCRASEUR.

TO THE EDITOR OF THE MEDICAL TIMES AND GAZETTE.

SIR,—As Amputation of the Penis seems now to occupy some space in your Journal, perhaps you may think the following case worthy of insertion. I was called in some few weeks ago to visit a patient in this Hospital suffering from epithelial cancer, which had increased so rapidly of late that the orifice of the urethra was entirely stopped, causing the man much pain and suffering. All efforts to pass an instrument were in vain, and from the condition of the patient we decided at once to amputate; but the Surgeon of the Hospital being very careful and rather dubious from the man's age,—sixty-four years,—I believe feared greatly the loss of blood, particularly as he was already so enfeebled. I suggested whether it would not be a good case for the *écraseur*, upon which he had his doubts, he never having seen the instrument employed. As I had operated before with it, by the advice of his *confères*, he acceded; whereupon the man was with difficulty, from his intemperate habits, put under the influence of chloroform. The *écraseur* being applied, to the great satisfaction of all present, the amputation was successfully performed, scarcely a drop of blood being lost. A catheter being passed and kept in the bladder for a few days was all that was done, and on the seventeenth day after the operation the man left the Hospital perfectly well, with a perfect penis, only of course, shorter. He has remained well ever since, and as yet no return of the disease is apparent.

Boulogne-sur-Mer, Oct. 17, 1859. I am, &c. J. WHITEHEAD, M.D.

COMMUNICATIONS have been received from:—

Professor SIMPSON; Professor SIMONDS; Dr. HESLOP, Birmingham; Dr. WEBB; Dr. WEST; Dr. RIGBY; Dr. HENDERSON; Dr. AVELING; Dr. CONOLLY; Dr. GOODWIN; Dr. THOMSON; Dr. R. D. THOMSON; Dr. COCKLE; Dr. HARLEY; Mr. JACKSON; Dr. DAVIES; Mr. SYNNOR; Mr. TODD; Mr. LONG; Mr. EVANS; Mr. JAMES; Dr. LEE; REGISTRAR GENERAL; Dr. FULLER; Mr. BURNELL; Mr. WHETLEY; Dr. COLLINSON; Mr. NORWAY; Dr. McSHANE; Mr. BROADBENT; REGISTRAR GENERAL, Edinburgh; Mr. SNAPE; Mr. STEDMAN; Mr. BENNETT.

APPOINTMENTS FOR THE WEEK.

November 19. Saturday (this day).

Operations at St. Bartholomew's, 1½ p.m.; St. Thomas's, 1 p.m. King's, 2 p.m.; Charing-Cross, 1 p.m.

21. Monday.

Operations at the Royal Free Hospital, 1 p.m.; Metropolitan Free Hospital, 2 p.m.

MEDICAL SOCIETY OF LONDON, 8½ p.m. Clinical Discussion.

22. Tuesday.

Operations at Guy's, 1 p.m.; Westminster, 2 p.m.

ROYAL MEDICAL AND CHIRURGICAL SOCIETY, 8½ p.m. Mr. Spencer Wells "On the Use of Woorara in Tetanus." Dr. Habershon "On Peritonitis."

23. Wednesday.

Operations at University College Hospital, 2 p.m.; St. Mary's, 1 p.m. Orthopaedic Hospital, 2 p.m.; Middlesex, 1 p.m.

MEDICAL SOCIETY OF LONDON, 8½ p.m. Lettsomian Lectures, by F. W. Pavy, M.D., Professor of Physiology at Guy's Hospital, "On Certain Points Connected with Diabetes." With Experimental Illustrations.

24. Thursday.

Operations at St. George's, 1 p.m.; Central London Ophthalmic, 1 p.m.; London, 1½ p.m.; Great Northern, 2½ p.m.

25. Friday.

Operations, Westminster Ophthalmic, 1½ p.m.

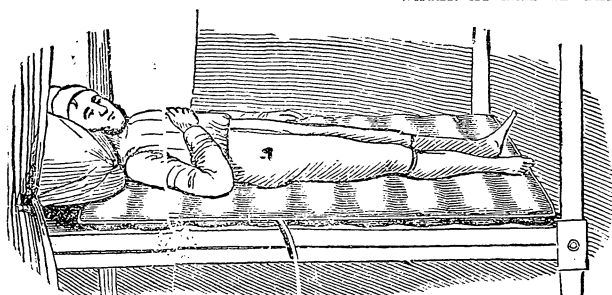

EXPECTED OPERATIONS.

King's College Hospital.—The following Operations will be performed this day (Saturday):—

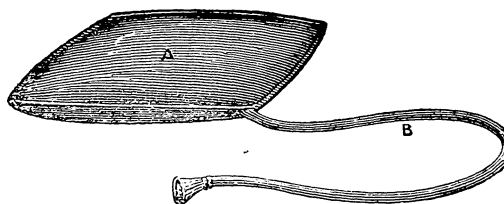

Mr. Fergusson.—Excision of Knee-Joint; Perineal Section.

HOOPER'S HYDROSTATIC BEDS, OR MATTRESSES AND CUSHIONS, FOR PLACING ON AN ORDINARY BEDSTEAD.

WATER AT ANY TEMPERATURE MAY BE USED.

HOOPER'S FULL-LENGTH MATTRESS OR HYDROSTATIC BED,
For Bedsores, Cancer, Coldness of the Body, Consumptive Cases, Diseased
Joints, Dropsy, Fevers, Fractures, Gout, Gun-shot wounds.

HOOPER'S CUSHION FOR GENERAL PURPOSES.

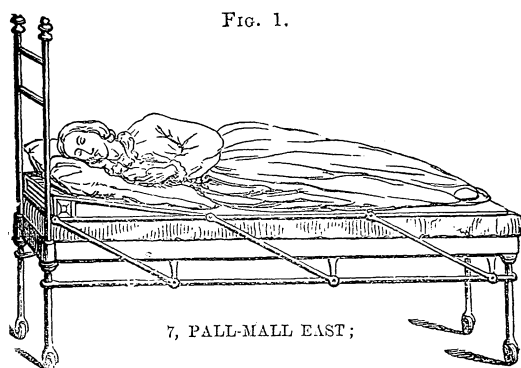

ANY SHAPED CUSHION CAN BE OBTAINED,

For Inflammation of the Bowels, Lassitude, Paralysis, Rheumatism, Spinal Affections, Sloughing Sores, Ulcerated Cartilages, and all Invalids.

HOOPER'S PATENT INVALID BED-LIFT.

THE OBJECT of this INVENTION is to enable the Patient to be raised in any position above the Bed, so as to allow the Medical Attendant, or Nurse, to get at any part of the body that may be requisite; and also that the Bed may be re-made, the chamber utensil used, and removed with facility.

FIG. 1.

7, PALL-MALL EAST;

FIG. 2.

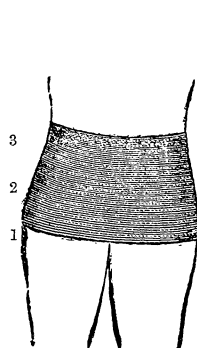

AND 55, GROSVENOR-STREET.

FIG. 1 represents a patient on the Patent Lift Bedstead, the Lifting Apparatus not being in use.

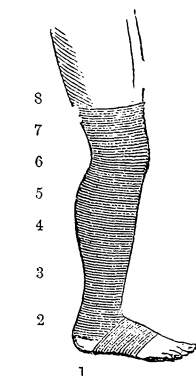

FIG. 2 represents the patient raised up from the ordinary level of the Bed by means of the Lift, so as to enable the Medical Attendant, or Nurse, to perform any of the offices before-named.

HOOPER'S SPIRAL ELASTIC SUPPORTERS.

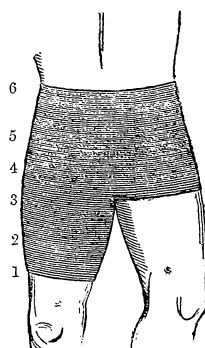

The Figures 1, 2, 3, &c. show the points at which the measures should be taken; the length should also be stated.

ABDOMINAL SUPPORTER.

STOCKING ABOVE THE KNEE.

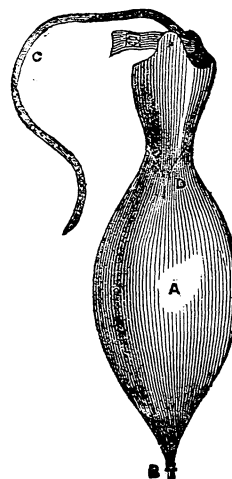

ABDOMINAL SUPPORTER AND THIGH-PIECE.

Constructed of a light porous material, unique in giving continuous and permanent pressure, can be accurately adjusted, and readily drawn over the parts requiring their use.

HOOPER'S URINALS,

WITH VALVE TO PREVENT LEAKAGE,

For Invalids, or Railway Travellers; whether Sitting, Reclining, or Walking; they are not affected by boiling water, and may, therefore, be easily kept clean.

WATERPROOF SHEETING, FOR PROTECTING BEDDING,

At a great Reduction in Price. It is soft and inodorous, and not acted on by Urine, Acids or Alkalis, and may be washed as Family Linen.

EXTRACT OF REPORTS from the Medical Department of the Three Presidencies of the Hon. East India Company; also Reports and Letters from numerous Members of the Medical Profession free by post.

WM. HOOPER, Operative Chemist, Sole Manufacturer 7, Pall-Mall East; & 55, Grosvenor-street, London.

WALTERS' INDIA-RUBBER URINALS.

F. WALTERS having originally invented these Urinals, begs to warn the Profession of the many bad and useless imitations which are now sold, and he would advise them, before purchasing, to look that they are stamped with his name; as, unless that be the case, he cannot guarantee them.

These conveniences are made for those who require them only occasionally, during a long journey, as well as for those invalids who use them always. Mr. WALTERS has much improved them by making them of *Etherised India-Rubber*, which adds very greatly to the strength of the India-Rubber, at the same time that it prevents its sticking together; by this means he is enabled to make them less stiff and harsh than hitherto, and yet to retain all the advantages of that stiffness. There is a patent valve, which prevents the return of the fluid; and they may be worn either sitting, walking, or lying, without the slightest inconvenience, and without being perceived by any one.

WALTERS' CONVENIENCES FOR LADIES will be found particularly useful during pregnancy. They are perfectly soft and flexible, and may be worn with perfect comfort.

All Orders must be accompanied by a Post-office order or reference.—Entrance for Ladies at the private door, where a Female attends.

MANUFACTURER OF ELASTIC STOCKINGS, BELTS, &c.

16, MOORGATE STREET, NEAR THE BANK, LONDON. E.C.

DR. DE JONGH'S
(Knight of the Order of Leopold of Belgium)

LIGHT-BROWN COD-LIVER OIL.

OPINION OF

EDWIN LANKESTER, Esq., M.D., LL.D., F.R.S.,

Late Lecturer on the Practice of Physic at St. George's Medical School, Superintendent of the Food Collection at the South Kensington Museum, &c. &c.

"I have much pleasure in bearing testimony to the excellent qualities of the Cod-liver Oil prepared under the superintendence of Dr. DE JONGH, of the Hague. "I believe that the purity and genuineness of this Oil are secured in its preparation by the personal attention of so good a Chemist and intelligent a Physician as Dr. DE JONGH. He was the first Chemist who gave an accurate analysis of the Cod-liver Oil, and the discoverer of an organic substance which it contains.

He has also written the best Medical treatise on the Oil with which I am acquainted. Hence I should deem the Cod-liver Oil sold under his guarantee to be preferable to any other kind as regard genuineness and medicinal efficacy.—S, Savile-row, W., August 1st, 1859."

SOLE CONSIGNEES AND AGENTS,

ANSAR, HARFORD, & CO., 77, Strand, London, W.C.

South African Sherry, 19s. 6d. Port,

22s. Claret, 18s. Madeira, 24s. Amontillado, 26s. Cognac, 18s. 6d. Her Majesty's Wine Merchant. Specially appointed since May, 1840. JAMES MARKWELL, Cellars, 35 to 40 & 45, Albemarle-street—Offices, 40, Albemarle and 4, Stafford Streets. Ports, from 30s.; Sherries, 30s.; Madeira, 42s.; Hocks, 40s.; Moselles, 40s.; Sparkling Hocks and Moselles, 48s.; Ditto, St. Peray, 54s.; Ditto, Burgundy, 60s.; Clarets, 28s.; Chablis, 38s.; Cote Rotie, 48s.; Champagne, 44s.; Sauterne, 40s.; Ditto, Yquem, 80s.; Essence of Turtle Punch, 56s.; Old Tom, 11s. 6d. All kinds of Foreign Spirits and Liqueurs. Particular and direct Shipments of Montilla, Vino di Pasto, Amontillado, Oloroso, Xres Viejo, Manzanilla, Longworth's Sparkling and Dry Catawba American Peach Brandy; Monongahela and Bourbon Whisky; and Sole Agent for the Celebrated Yankee Bitters. Bottled Stock for inspection, 6000 dozen. Cash or Reference. As usual, very liberal prices given for genuine Old Bottled Wines. Half-pints of first-class Champagne only.

N.B.—A considerable quantity of the Old Bottled Wines removed to Mr. M.'s Stock from Long's Hotel, North and South American Coffee House, Shugborough Park, and the celebrated Reading Sale.

Important Saving, by Prepayment,

in the PURCHASE of
NEW WHITE ROUND MOULDED VIALS OF THE BEST QUALITY.
PELLATT and Co. submit the following PRICES of VIALS, for PREPAYMENT only:—

1 oz., 10 dr., and 1½ oz. per Gross, 6s.	In quantities of not less than
14 dr., and 2 oz. " 7s.	Six Gross, assorted to suit the
3 oz. " 8s.	convenience of the purchaser,
4 oz. " 10s.	delivered to carriers in London.
6 oz. " 15s.	No charge for Package.
8 oz. " 18s.	Breakage at risk of Pur-
1½ oz. graduated in 3 doses, " 12s. 6d., chaser.	

The above Prices being based upon a calculation which excludes all charges whatever between the Manufacturer and the Consumer, no attention can be paid to any order not accompanied by a remittance in full, made payable in London.—P. and Co. do not supply Green Glass.—Orders and remittances to be addressed,

PELLATT & Co.,
FALCON GLASS WORKS, LONDON.

W. Twinberrow begs to draw the

attention of the Medical Profession to his EXTRACT of INDIAN HEMP, prepared expressly for him at Calcutta, its peculiar sedative properties being so beneficial where opiates are inadmissible. Also to his MEDICINAL EXTRACTS, prepared from the fresh plants (Hyoscyamus Niger, Conium Maculatum, Atrop, Belladonna, Cotyledon Umbilicus, etc.) Also to his Liq. Taraxaci, Liq. Galli Aparinis (a valuable alterative), Liq. Parietarise (diuretic), and Liq. Beloe (prepared from the Ægle Marmelos, or Indian Bael), for dysentery and diarrhoea. W. T. has a large supply of INDIAN BAEL on hand. 2, Edwards-street, Portman-square. BOUDAULT'S PEPSINE imported in original bottles. *Ext. Laricis Europ.*

BASTICK'S OLEO CUBEINE.

This Elegant Preparation consists of

the active principles of cubebs—namely, the cubebene and the essential oil in their most effective and least nauseous form. It has been administered with very satisfactory results in gonorrhoea and other diseases where the use of cubebs is indicated. It forms an excellent combination with copaiba balsam. Dose, thirty to sixty minims in an emulsion or floating on water.

Pharmaceutical Laboratory, 2, Brook-street, Bond-street, London.

Tarrant's Bandage and Strengthening

PLASTER.—This Plaster, from the nature of the composition and the material on which it is spread, is adapted for a permanent bandage, as it neither produces irritation of the Skin, nor, when applied, does heat cause it to lose its adaptation to the part. Having these qualities, it is peculiarly valuable in the treatment of ulcerated legs, varicose veins, etc., where equal and constant support is required. Several of the most eminent Surgeons continue to use this Plaster in their practice, preferring it, in certain cases, to any other. It is well suited for exportation to, and use in, warm climates, the high temperature having less effect on it than on any other Plaster.

The Profession are referred to Messrs. Westwoods and Hopkins, Wholesale Druggists, Newgate-street, where the Plaster may be had in packets, containing three yards, for 2s. 6d.; or, spread upon skins of Chamois leather, at 3s. 6d.

Westwoods and Hopkins also call attention to the Compound Adhesive Plaster, for fractures and wounds, as likewise to their Concentrated Preparations, Essences, etc.

Williams and Son's Pure Glycerine

SOAP. Analysed by Dr. Hofmann, F.R.S., and Professor Redwood, Ph.D., strongly recommended by many eminent members of the Medical Profession, and favourably noticed by the following Medical Journals:—

THE LANCET.
THE MEDICAL TIMES AND GAZETTE.
THE BRITISH MEDICAL JOURNAL.
THE MEDICAL CIRCULAR.
EDINBURGH MEDICAL JOURNAL.
THE DUBLIN HOSPITAL GAZETTE.

It is suited to all cases of delicate skin (whether arising from disease or otherwise), and is admirably adapted for nursery use. May be had of all respectable Chemists, Perfumers, etc.

SOAP-WORKS, CLERKENWELL, LONDON, E.C.

Those who cannot swallow Cod-Liver

OIL in its crude state should try NEWBERRY'S COD-LIVER OIL CAKES.—"The gingerbread is extremely light and pleasant, the flavour of the oil being completely covered."—Medical Times, Feb. 12th, 1859. Packets, 1s. 9d. and 3s. F. NEWBERRY and SONS (Proprietors of the "PULVIS JACOBI VER., NEWBERRY'S," &c.) 45, St. Paul's Churchyard, London. ESTABLISHED A.D. 1746.

Medical Examinations, &c.—Gentle-

MEN can be Prepared for the College, Hall, and other Examining Boards, either privately or by correspondence. Classes, to consist of a limited number only, are now forming, for the convenience of gentlemen who are desirous of going up at the close of the present session. Address, Medical Tutor, Lewis's Medical Library, 15, Gower-street North, W.C.

Medical.—An Out-door Situation is

Required by a Gentleman, aged 37, competent to fulfil the whole duties of a Town, Country, Private, or Union Practice, having had considerable experience. Most undeniable references. Address, Medicus, Post-office, Wellington, Somerset.

Epilepsy.—The Desideratum of a

Suitable and Beneficial HOME for SUFFERERS from EPILEPSY has been for several years successfully supplied by the Advertiser. To any friend or Medical adviser of such an Invalid, the fullest particulars would be supplied. Address, F.S., Bluck's, Stationer, Hampstead, N.W.

Society for the Relief of Widows

and ORPHANS of MEDICAL MEN in LONDON and its VICINITY. Instituted 1788.—The Members are reminded that a QUARTERLY COURT of Directors will be held on the 7th day of December next, at which Candidates for admission into the Society can be proposed. It is desirable that the form of proposal be filled up and forwarded to the Secretary a few days before the Meeting. The forms of proposal may be obtained of the Secretary. The benefits of the Society are restricted to the families of deceased Members of not less than two years' standing. The Secretary attends at the Office every Wednesday and Friday, from 4 to 5 o'clock.
53, Berners-street, W. S. W. J. MERRIMAN, M.D., Secretary.

Wimborne and Cranborne Union.—

APPOINTMENT of MEDICAL OFFICER.—The BOARD of GUARDIANS of the Wimborne and Cranborne Union will, at their meeting to be held at the Board Room, in Wimborne, on FRIDAY, the 25th day of November next, proceed to the appointment of a Medical Officer for the third district of the said Union, comprising the parishes of Cranborne, Edmondsham, Horton, Pentridge, Wimborne, St. Giles, and Woodlands, containing an area of 27,710 acres and a population of 4690. Salary £75 per annum, with all extras allowed by the consolidated order and other orders of the Poor-Law Board. The person appointed will be required to enter into a contract for the due performance of Vaccination in such district. Applications and testimonials, with certificates of qualification, to be sent under cover to me, on or before the 24th day of November next. The person elected will have to enter on the duties of the office immediately.

By order of the Board,
GEORGE LANGER, Clerk to the Guardians.
Wimborne, October 31st, 1859.

Evening Demonstrations of Anatomy.

—Mr. CHRISTOPHER HEATH, Demonstrator of Anatomy at the Westminster Hospital, will resume his Evening Course of DEMONSTRATIONS and EXAMINATIONS upon the DISSECTED SUBJECT on Wednesday, the 5th of October. The Demonstrations take place on Monday, Wednesday, and Friday evenings, during the Winter Session, from Seven to Nine o'clock, at the Westminster Hospital. Entrance Fee (perpetual), Five Guineas.

Medical Society of London, Lettsomian

LECTURES, "On Certain Points connected with Diabetes," with Experimental Illustrations. By F. W. PAVY, M.D., Professor of Physiology at Guy's Hospital. Each Lecture will commence on the three following Wednesdays, viz. Nov. 23, 30, and Dec. 7, at Half-past Eight, p.m. precisely.
F. W. MACKENZIE, M.D. } Hon. Secretaries.
THOMAS BRYANT, }

82A, George-street, Hanover-square, W.

University of London.—Notice is

HEREBY GIVEN, That the first Half-yearly Examination for MATRICULATION in this University will commence on MONDAY the 9th of January, 1860. Every Candidate is required to transmit his certificate of age to the Registrar (Burlington House, London, W.) at least fourteen days before the commencement of the Examination.
Nov. 10th, 1859. WILLIAM B. CARPENTER, M.D., Registrar.

To Surgeons, Dentists, etc.—The Best

HOUSE in London for SECOND-HAND INSTRUMENTS is Mr. WM. LAWLEY'S, Lombard House, 78, Farringdon-street, City.

Established upwards of a Century.

A large Stock of New Instruments always on Sale, all Warranted.

Instruments Bought, Sold, or Exchanged.

N.B.—The largest Stock of Second-hand Dissecting Cases in London.

POULTICES SUPERSEDED! SPONGIO PILINE.

The Profession are respectfully

informed, that the WANDLE FELT COMPANY having purchased Mr. MARKWICK'S PATENT for the well-known SPONGIO PILINE, for the application of moist heat, in lieu of Poultices and Fomentations, and the IMPERMEABLE PILINE, for Rheumatism, for promoting perspiration, and for the application of stimulating liniments, are now supplying these articles, of superior manufacture, and at greatly reduced prices, at 27, BEDFORD-BURY, COVENT-GARDEN, London, and also through the Wholesale and Retail Druggists in town and country.

Scammony Manufactured from the

ROOT.—This Pure Resin may be had of all Wholesale Druggists at 25 per cent. under the price of the best Virgin Scammony. And the superiority of its quality was fully explained at a meeting, of the Pharmaceutical Society, and reported at length in their Journal of March last, from which the following are extracts:—

"From these numerous observations, one hundred and twenty in number, together with many others which have not been tabulated, I am quite convinced that the scammony prepared by the new process from the untapped root is quite equal, as a remedy, to the very best virgin scammony which is met with in commerce, and equal, in fact, to the resin which is extracted from commercial scammony by means of ether; and it possesses this most important advantage over the scammony of commerce, namely, of being entirely free from the frauds which are almost constantly practised upon it in the country where the plant grows, and in which it has hitherto been collected, and, therefore, being perfectly uniform in its physical characters, composition and therapeutic action. There can, therefore, be no objection, but, on the other hand, manifest advantage, in employing it in place of the scammony commonly met with.

"A. B. GARROD, M.D., F.R.S., F.R.C.P.

"Professor of Materia Medica, Therapeutics and Clinical Medicine at University College; Physician to University College Hospital."

"I have endeavoured to ascertain the relative activity of Messrs. M'Andrew's scammony, and of a fine specimen of commercial virgin scammony, by prescribing these drugs alternately in equal doses to the same patient. The results, according to the judgment of myself and others who have assisted me in watching the cases, is that in most instances Messrs. M'Andrew's scammony has proved itself decidedly more active than the virgin scammony. As to pleasantness of operation, or the reverse, there seemed to be no choice between the two specimens.

"That a preparation of scammony should be a little more or a little less active is of comparatively small importance. It is far more important that the drug should have a fixed and uniform composition and activity, so that the prescriber may know, with an approach to certainty, what doses are required to produce a given effect. This advantage of uniform activity Messrs. M'Andrew's Scammony seems likely to possess over the scammony which has hitherto been in common use, and which is a drug notoriously of most uncertain composition and power.

"GEORGE JOHNSON, M.D., F.R.C.P.

"Professor of Materia Medica and Therapeutics in King's College; Physician to King's College Hospital."

Blancard's Pills of Unchangeable

IODIDE OF IRON.

Recommended by the Academy of Medicine of Paris, and authorised by the Medical Council of St. Petersburg. Extensively tried in the Hospitals of France, Belgium, Ireland, Turkey, &c. Favouredly noticed at the Universal Exhibition of New York, 1853, and Paris, 1855.

"Of all the modes hitherto proposed of administering iodide of iron in the pure state, I think Mr. Blancard's the best."—Chemistry applied to Therapeutics, by M. Mialhe, Deputy-Professor to the Faculty of Medicine of Paris, Pharmacien to the Emperor, 1856, p. 319.

These Pills stand now very high in the therapeutics of every country, as may be seen by the above quotations, and also by the numerous scientific articles in medical periodicals and works (a).

Being enveloped in a very thin resino-balsamic coating, they present the great advantage of not being liable to any deterioration, of having no taste, of being small, and not distressing the stomach. As they possess the properties both of iodine and iron, they are especially beneficial in chlorotic, scrofulous, tubercular, or cancerous affections, as also in leucorrhœa, amenorrhœa, anemia, &c. &c. and they furnish the medical man with an excellent means of modifying lymphatic, feeble, and debilitated constitutions. Dose, 2 to 4 pills a day.

N.B.—Impure or altered Iodide of Iron is an unsafe remedy, and may even prove dangerous. Only such bottles as bear an electro-plated seal fixed to the lower part of the cork, and the signature of the inventor placed on a green label, are to be considered as prepared by Mr. Blancard. The public should beware of spurious imitations.

To be had at M. BLANCARD'S, Pharmacien, Rue Bonaparte, No. 40 Paris. General dépôt in England at M. Gabriel Jozeau's, French chemist 49, Haymarket, London. In Ireland, at Mr. Vitties, Stevens's Hospital Dublin. In the United States, at E. and S. Fougere, Chemists, 30, North William-street, New York. To be obtained retail from the principal Chemists.

Mr. Howard, Surgeon-Dentist, 52,

FLEET-STREET, has introduced an entirely NEW DESCRIPTION of ARTIFICIAL TEETH, fixed without Springs, Wires, or Ligatures. They so perfectly resemble the natural teeth as to be distinguished from the original by the closest observer; they will NEVER CHANGE COLOUR or DECAY, and will be found very superior to any teeth ever before used. This method does not require the extraction of roots, or any painful operation, and will give support and preserve teeth that are loose, and is guaranteed to restore articulation and mastication; and that Mr. Howard's improvements may be within the reach of the most economical, he has fixed his charges at the lowest scale possible. Decayed Teeth stopped and rendered sound and useful in mastication.
52, Fleet-street. At home from Ten till Five.

MEDICAL AGENCY.

NOTICE OF REMOVAL AND CHANGE OF FIRM.

Mr. Lara (for the last eight years the sole representative of LANE and LARA, Medical Agents and Arbitrators and Lunatic Asylum Registrars,) begs to inform the Profession that, in consequence of the daily increasing support with which he has been favoured, and for which he tenders his sincerest thanks and acknowledgments, he has taken into PARTNERSHIP Mr. James Maxfield Walters, a gentleman who has had considerable experience in the business. It will, therefore, from and after Christmas, 1858, be carried on, under the Firm of LARA and WALTERS, at 6, PUMP-COURT, Middle Temple, E.C., whither they have removed their Offices from 22, Buckingham-street, Adelphi, in order to provide that larger accommodation which a constant intercourse with a great majority of the entire body of General Practitioners in England has rendered necessary.

Partnerships and Practices sold and valued: Asylums transferred: Arbitrations effected: Assistants provided (if for a permanence without charge to Employers): and every other description of business transacted for the Profession at a fixed and moderate cost. Attendance from 11 till 4.

No. 12, Old Burlington-street.—Capital Furniture, Valuable Collection of Framed Prints, after the Old Masters, and a few Pictures and Books, the property of Sir John Forbes, M.D., &c., removing into the country.

Messrs. Rushworth and Jarvis will sell by AUCTION, on the Premises, on Wednesday, November 30 (the house having been disposed of), the well-manufactured and useful FURNITURE, comprising the customary requisites in the bed chambers, drawing- and dining-room appendages, in rosewood and mahogany; chimney and pier-glasses, mauve curtains, Turkey, Brussels, and other carpets, Grecian lamps, range of open bookshelves, a few books and pictures, several fine prints, comprising works of Raphael, Morghen, and other esteemed engravers of the old school; fittings of hall and domestic apartments, china, glass, and miscellaneous useful effects. To be viewed the day previous, and catalogues had on the premises, and at the offices of Messrs. Rushworth and Jarvis, Savile-row, W., and 19, Change-alley, Cornhill, E.C.

City Dispensary, 76, Queen-street, CHEAPSIDE, E.C.—A Vacancy having occurred in the office of Physician to this Charity, through the resignation of Dr. T. W. Jones, gentlemen desirous of becoming Candidates, can obtain information as to the Qualifications and other particulars, on application at the Dispensary. Testimonials to be forwarded, addressed to the Committee of the City Dispensary, 76, Queen-street, E.C., before Three o'clock in the afternoon of Monday, the 12th December next, and all applicants must attend the Committee to be admitted Candidates for the Office at Four o'clock on that day. The Election will take place on Monday, 19th December next.

By Order of the Committee, WILLIAM W. E. ATKIN, Secretary.
November 15th, 1859.

The Committee of Visitors of the LUNATIC ASYLUM for the Counties of Bedford, Hertford, and Huntingdon lately erected near Arisey, Bedfordshire, are prepared to appoint an ASSISTANT MEDICAL OFFICER to the Asylum, with a salary of £70 per Annum, with Board, Washing, and Furnished Apartments. He must be a Member of the Royal College of Surgeons, London, and a Licentiate of the Apothecaries' Company, and duly registered according to law. He will be expected to enter upon his duties early in the ensuing year, on the opening of the Asylum. Applications, with testimonials, and a statement of Professional Qualifications, age, and previous engagements, to be addressed to the Committee of Visitors, under cover to the Clerk to the Visitors, St. Cuthbert-street, Bedford, on or before the 19th of December next, who will give any further information that may be required.
Bedford, October 10, 1859.

Northampton General Lunatic ASYLUM.—A RESIDENT MEDICAL SUPERINTENDENT is REQUIRED for this Institution. He must be either a Doctor of Medicine of one of the Universities of the United Kingdom, where residence and exercise are required to take a Degree, or a Fellow or Member of the Royal College of Surgeons of England, and must have had experience in the treatment of Insanity. He must be a Member of the Church of England, and married. Salary, £400 per annum, with Furnished Apartments, Board and Attendance. Candidates qualified as above are requested to send in their Testimonials to the Secretary, on or before the 28th day of November next. Candidates whose qualifications are approved will be invited to attend a Meeting of the Directors (at their own expense), of which they will receive notice, and the Testimonials of other Candidates will be returned. The Gentleman selected will be required to enter upon his duties on the First day of February, 1860.
The Asylum, Oct. 27th, 1859. JOHN GODFREY, Secretary.

Tunbridge-Wells Infirmary and DISPENSARY.—WANTED, a RESIDENT HOUSE-SURGEON and MEDICAL ASSISTANT. He must be unmarried, a Registered Surgeon, and a Licentiate of the London Company of Apothecaries. His duties will be to dispense, and to attend, under the direction of the Physicians and Surgeons, the in-patients, and those out-patients who reside within one mile of the Infirmary, and are too ill to attend there. He will also be required to act as Secretary. No Private Practice allowed, and he must engage not to practise within five miles of the Infirmary for three years after quitting office. Salary to commence at £100 per annum; furnished apartments, rent free in the Infirmary, with coals and candles. Candidates must forward their certificates and testimonials, carriage paid, to "the Secretary, Infirmary, Tunbridge-Wells," on or before Saturday, December 3. Personal attendance not necessary. The appointment will be made on Monday, December 5. The duties will commence on Saturday, December 17.
November 8, 1859.

Medical Transfer and Partnership.

30, Bucklersbury, Cheapside.

Mr. Orridge, Medical Transfer Agent, Referee, and Valuer of Medical Property, may be consulted, at the above Address, by Gentlemen about to receive PARTNERS, or to RELINQUISH or to COMMENCE Practice.

Mr. Orridge is known to many of the Hospital Physicians and Surgeons of London.

He has been concerned professionally for a considerable proportion of the most influential Practitioners (including Partners in many of the leading Medical Firms), to whom he has the satisfaction of being permitted to refer—a privilege that he trusts will be regarded as a proof of the sincerity of his endeavours to conduct these transactions in an honourable and straightforward manner.

Gentlemen desirous of obtaining Mr. Orridge's opinion, or requiring his attendance professionally in any part of England, can obtain terms on application, by (confidentially) transmitting name and address.

Office Hours, from Eleven to Four.

Resident Clinical Assistant.—A

VACANCY having occurred in the Hospital for Consumption and Diseases of the Chest, those gentlemen who are desirous of becoming Candidates for the vacant office are requested to send in their applications, with Testimonials, on or before Monday the 28th instant, and to attend the Medical Committee on the same day, at 4 o'clock. Testimonials as to moral character, as well as to Medical qualifications are required. Further particulars may be obtained at the Hospital.

PHILIP ROSE, Hon. Secretary.

Brompton, Nov. 16, 1859.

HENRY DOBBIN, Secretary.

Stockport Infirmary.—Wanted, an

ASSISTANT HOUSE-SURGEON and APOTHECARY. He must be a Member of one of the Royal Colleges of Surgeons, and a Licentiate of the Apothecaries' Hall. His duties will be to visit home patients and assist in the duties of the house. Engagement for two years, at a salary of £50 per annum, with Board and Apartments in the Infirmary. Testimonials to be sent prepaid to Mr. S. W. Wilkinson, Hon. Sec., at the Infirmary on or before the 3rd of December. The Election will take place on Monday December 5th.

By Order of the Committee, Stockport Infirmary, October, 1859.

S. W. WILKINSON, Hon. Sec.

To Unqualified Assistants.—A

SURGEON in the Country wishes to meet with a good Practical Man, who could be relied on in cases of emergency. The regular duties are very light, and the situation would suit a gentleman of quiet habits. He would have a comfortable home, and a Moderate Salary would be given. Address, with references, to Medicus, the Post-office, Nottingham.

Death Vacancy.—For Immediate

DISPOSAL, in consequence of the sudden death of the late Practitioner, a rapidly increasing PRACTICE, in a wealthy and fast-improving Neighbourhood, in the western part of the county of Somerset. A Good House, Stabling, etc. with Garden and Orchard at an annual rental of £25, is attached. The Furniture, including Drugs and Surgery Fixtures, will have to be taken. An excellent opportunity for an energetic man. Terms moderate. Particulars of Medicas, care of Mr. Peren, Solicitor, South Petherton, Somerset.

A M.D. St. Andrews, M.R.C.S. Eng.,

and L.A.C., Single, aged thirty-two, wishes for an Engagement as ASSISTANT in a GOOD CLASS PRACTICE, without Union or Club Appointments, in the Country, or a large Provincial Town. Salary, &c. a secondary consideration. Or an arrangement would be made to pay for Board and Lodging in the house of any gentleman who could offer a Comfortable Home for a few months, and would only require limited assistance. Address, M.D., care of Mr. Bridge, News agent, etc. 2, Sherrard-street, Golden-square, London.

Medical.—Ledbury Poor-Law Union.

—The office of MEDICAL OFFICER of the Yorkshire District of this Union, will be VACANT on the 25th day of December next. The Board of Guardians invite the application of Candidates who possess one of the four qualifications stipulated in the Poor-Law Commissioners' Consolidated Order of July 24th, 1847. The Medical Officer will be required to reside in the town of Ledbury, and conform in every respect to the Regulations of the Poor-Law Board. The District comprises Thirteen Parishes; area 20,925 acres; population 4587. Salary £100 per annum. The said salary to be inclusive of, and in consideration of, all extra fees, payable under the General Consolidated Order of the Poor-Law Commissioners. The Guardians will provide Medicines and Appliances; also, a competent person to dispense the same. The Election will take place at the Board-Room, Ledbury, on TUESDAY, the 13th day of December next, and the person appointed will hold the Office until he shall die, resign, or become legally disqualified to hold such office, or be removed by the Poor-Law Board. Testimonials to be sent to me, on or before the 12th day of December next. Candidates to be in attendance at the Board-Room, Ledbury, on the day of the Election.

Ledbury, Nov. 16th, 1859.

By Order of the Board of Guardians, J. HUGHES, Clerk.

London: Printed by CHARLES REED and BENJAMIN PARDON of 1, 2, and 3, Lovell's-court, Paternoster-row, in the City of London, and published by JOHN CHURCHILL, at the Publishing Office, No. 11, New Burlington-street, in the Parish of St. James, in the City of Westminster.—November 19, 1859.

A Manual of the Dissection of the HUMAN BODY. By LUTHER HOLDEN, F.R.C.S., Lecturer on Anatomy at St. Bartholomew's Hospital.

*** Finding it impossible to complete the Illustrated Edition, as announced for this Session, the Author, in compliance with the earnest request of his class, has reprinted the First Edition with some necessary corrections and emendations.

By the same Author,
Second Edition, much enlarged, 8vo, cloth 16s.

Human Osteology: comprising a Description of the Bones, with Delineations of the Attachments of the Muscles, &c.

"This second edition is much improved. In addition to the matter contained in the first edition, this issue embraces the cartilages and muscles of the larynx, and the anatomy of the internal ear, each illustrated by numerous wood engravings and plates. Mr. Holden's work is remarkably cheap."—The Lancet.

"The work is so well known as a most useful aid to the student in learning the bones, that we need only remark that this edition is made more complete than the first, by the addition of the cartilages and muscles of the larynx, and the anatomy of the internal ear."—Medical Times and Gazette.

"No student need seek a grinder as long as he can possess himself of this very admirable volume, which is now the text-book of the schools."—British Medical Journal.

CAUTION.
Chlorodyne.—Any Preparation sold
or advertised under the name of Chlorodyne, other than Dr. J. COLLIS BROWNE'S, is not that recognised and prescribed by the Profession, for which so great and valuable testimony is accorded, as published in the Medical Journals. Dr. J. COLLIS BROWNE'S Chlorodyne is the only genuine, he having alone discovered and named this new agent, and confided its manufacture absolutely, solely, and entirely, to J. T. DAVENPORT, Pharmacist, 33, Great Russell-street, Bloomsbury, London.
N.B.—Medical men are earnestly solicited to attach the words "Dr. J. Collis Browne's Chlorodyne" when prescribing, also to observe that the signature of Dr. J. Collis Browne, in white letters on a red ground, is outside each bottle.
The spurious compounds sold under the name of Chlorodyne not only invariably fail to produce the extraordinary beneficial effects accorded to the genuine, but often occasion most serious results, and being a remedy so often resorted to in extreme cases, the life of the patient, and the credit of the Practitioner is at stake. The active principle of Chlorodyne has never been publicly intimated, its effects are quite dissimilar to opium or its salts. It relieves pain in any organ and from whatever cause. Spurious compounds will be sure to disappoint. Dr. J. Collis Browne's Chlorodyne is the only genuine.

To Surgeons, Dentists, etc.—The Best

Those who cannot swallow Cod-Liver
OIL in its crude state should try NEWBERRY'S COD-LIVER OIL CAKES.—"The gingerbread is extremely light and pleasant, the flavour of the oil being completely covered."—Medical Times, Feb. 12th, 1859. Packets, 1s. 9d. and 3s. F. NEWBERRY and SONS (Proprietors of the "PULVIS JACOBI VERI. NEWBERRY'S," 45, St. Paul's Churchyard, London. ESTABLISHED A.D. 1746.

NEPENTHE, OR ANODYNE TINCTURE

(OBTAINED EXCLUSIVELY FROM OPIUM).

PREPARED AT THE LABORATORY OF FERRIS, TOWNSEND, LAMOTTE, & BOORNE,
MANUFACTURING CHEMISTS AND WHOLESALE DRUGGISTS, BRISTOL.

This preparation has now been for many years extensively used by a large number of eminent members of the Medical Profession with the greatest success. It does not produce headache, stupor, giddiness, prostration of strength, constipation, or the usual unpleasant symptoms attending the use of other preparations of opium.

Nepenthe has frequently been found of essential service in cases of Cancer, where every other opiate has failed.

The following Testimonials received from Medical gentlemen in extensive practice will be regarded as satisfactory proof of its efficacy:—

MEDICAL TESTIMONIALS.

"Having prescribed your 'Anodyne Tincture' in many cases, I would strongly recommend its more general adoption. It is especially useful in the wakefulness common after parturition, or other unusual exertion or excitement. It produces a refreshing sleep, and I do not remember any case in which it has caused the objectionable effects of the other opiate preparations."

"S, Wellington-street, London-bridge, August 14, 1856.

"SAML. GRIFFITH, M.D. London, M.R.C.P.

Consulting Physician-Accoucheur to the Farringdon Dispensary,
Physician-Accoucheur to St. Thomas's Hospital, &c."

"Ipswich, March, 1859.

"Gentlemen,—I have great satisfaction in bearing testimony to the value of your 'Nepenthe,' in relieving suffering from disease, and in procuring sleep, where ordinary narcotics fail or disagree. For several months I have found it very effectual in relieving a great sufferer when all the ordinary anodynes had ceased to benefit, and although the dose has not been increased for months, the relief is as complete."

"Nepenthe" is a very valuable addition to our means of relief, and the Profession and the public are greatly your debtors for it.

"I am, Gentlemen, yours obediently,

EDWD. BECK, M.D. Cantab.
Physician to the East Suffolk and Ipswich Hospital."

"To Messrs. Ferris & Co.

"Gentlemen,—'Nepenthe' has, for some time, been a favourite narcotic with me, and I infinitely prefer it to any preparation of opium now extant. It has proved a remedy of great value in all cases of Neuralgia, Chronic Rheumatism, Hypochondriacism, and indeed all affections where the use of a sedative is indicated; and in Delirium Tremens it is certainly invaluable, performing its operation upon the system, without leaving those distressing feelings consequent upon the use of opiates in general."

"I remain, Gentlemen, your obedient Servant,

"WILL. WOOD BRADSHAW, M.D. M.R.C.P. & F.R.C.S. Lond. &c. &c. &c."

Extract of a Letter from the late G. W. CAINES, Esq. M.R.C.S.

"Uffculme (Devon), Feb. 16, 1854.

"Please to send me some 'Nepenthe,' as I have a patient with cancer in the breast, with whom no other preparation of opium agrees. I have tried them all."

NEPENTHE may be procured direct from Messrs. FERRIS and CO., 4 and 5, Union-street, Bristol; from respectable Dispensing Chemists throughout the Kingdom; and from the following Agents:—

LONDON:—Mr. Thos. Keating, 79, St. Paul's-churchyard; Messrs. Evans, Lescher, and Evans, 60, Bartholomew-close; Messrs. Savory and Moore, 143, New Bond-street; Messrs. J. Bell and Co., 339, Oxford-st.

MANCHESTER:—Mr. James Woolley.

LIVERPOOL:—Messrs. Clay and Abraham; Messrs. Evans, Son, and Co.; Messrs. Clay, Dod, and Case.

BIRMINGHAM:—Messrs. Southall Bros. and Co.

YORK:—Messrs. Butterfield, Clarke and Co.

NORWICH:—Messrs. Smith and Sons.

PLYMOUTH:—Messrs. Balkwill and Co.

EXETER:—Mr. Geo. Cooper; Messrs. A. Evans and Co.

EDINBURGH:—Messrs. Raimes and Co.

As many imitations of Nepenthe have been attempted, the signature of FERRIS and COMPANY is placed over the cork of every bottle of the true preparation; and none purchased without this protection can be depended upon.

WALTERS' INDIA-RUBBER URINALS.

F. WALTERS having originally invented these Urinals, begs to warn the Profession of the many bad and useless imitations which are now sold, and he would advise them, before purchasing, to look that they are stamped with his name; as, unless that be the case, he cannot guarantee them.

These conveniences are made for those who require them only occasionally, during a long journey, as well as for those invalids who use them always. Mr. WALTERS has much improved them by making them of *Etherised India-Rubber*, which adds very greatly to the strength of the India-Rubber, at the same time that it prevents its sticking together; by this means he is enabled to make them less stiff and harsh than hitherto, and yet to retain all the advantages of that stiffness. There is a patent valve, which prevents the return of the fluid; and they may be worn either sitting, walking, or lying, without the slightest inconvenience, and without being perceived by any one.

WALTERS' CONVENIENCES FOR LADIES will be found particularly useful during pregnancy. They are perfectly soft and flexible, and may be worn with perfect comfort.

All Orders must be accompanied by a Post-office order or reference.—Entrance for Ladies at the private door, where a Female attends.

MANUFACTURER OF ELASTIC STOCKINGS, BELTS, &c.

16, MOORGATE STREET, NEAR THE BANK, LONDON. E.C.

DR. DE JONGH'S

(Knight of the Order of Leopold of Belgium)

LIGHT-BROWN COD-LIVER OIL.

OPINION OF

EDWIN LANKESTER, Esq., M.D., LL.D., F.R.S.,

Late Lecturer on the Practice of Physic at St. George's Medical School, Superintendent of the Food Collection at the South Kensington Museum, &c. &c.

"I have much pleasure in bearing testimony to the excellent qualities of the Cod-liver Oil prepared under the superintendence of Dr. De JONGH, of the Hague. "I believe that the purity and genuineness of this Oil are secured in its preparation by the personal attention of so good a Chemist and intelligent a Physician as Dr. De JONGH. He was the first Chemist who gave an accurate analysis of the Cod-liver Oil, and the discoverer of an organic substance which it contains."

He has also written the best Medical treatise on the Oil with which I am acquainted. Hence I should deem the Cod-liver Oil sold under his guarantee to be preferable to any other kind as regard genuineness and medicinal efficacy.—S, Savile-row, W., August 1st, 1859."

SOLE CONSIGNEES AND AGENTS,

ANSAR, HARFORD, & CO., 77, Strand, London, W.C.

No. 1, 2, 3, is J. Alderman's

Patent Graduating Elastic Couch, shown in different positions: it is fitted with two, three, or four distinct graduating actions, by which an Invalid can be graduated to any position, without being touched by the nurse, and free from all pressure, so that a patient cannot possibly become bedsores by long confinement.

No. 4, 4, is J. A.'s improved Spinal or general Invalid Couch and Carriage. The couch can be adjusted to any position, and has a shifting stand on easy castors for the room; so that the patient can be lifted with the couch from the stand to the

No. 8, 8, is J. A.'s Patent Portable Equilibrium Carrying Chair, which enables an Invalid to be carried up and down stairs with perfect ease and safety. It is also an easy chair for the room when the handles are off, and free from oscillation.

No. 9 is J. A.'s improved Four-wheel Albert Chair, fitted for hand or pony: the body being mounted upon C and under springs behind, and elliptic springs in front, which make it a most elegant and easy carriage.

No. 10 is J. A.'s improved Four-wheel Brighton Chair, mounted upon C and under springs both back and front, and has his new wrought-iron perches or cranes. Instead of the old-fashioned wood perches. This is the most elegant and easy carriage in use.

No. 11, 11, is J. A.'s improved Three-wheel Albert Chair, with and without a head, which is as elegant and easy as can be made with three wheels.

No. 12 is J. A.'s improved Three-wheel Garden or Bath Chair, fitted with or without a head, and of the cheapest construction.

carriage without being touched, so as to go out for an airing when required.

No. 5, 5, is J. A.'s Patent Graduating Elastic, Self-adjusting Chair, which, like the couch, is made to follow nature in every respect—the back, the arms, the seat, and leg rest being made to work all together, so that not a muscle of the patient need be disturbed. The arms are also made to put on and off, so that the patient can get on and off from either side while the leg-rest is up.

No. 6 is J. A.'s improved Exercising Horse.

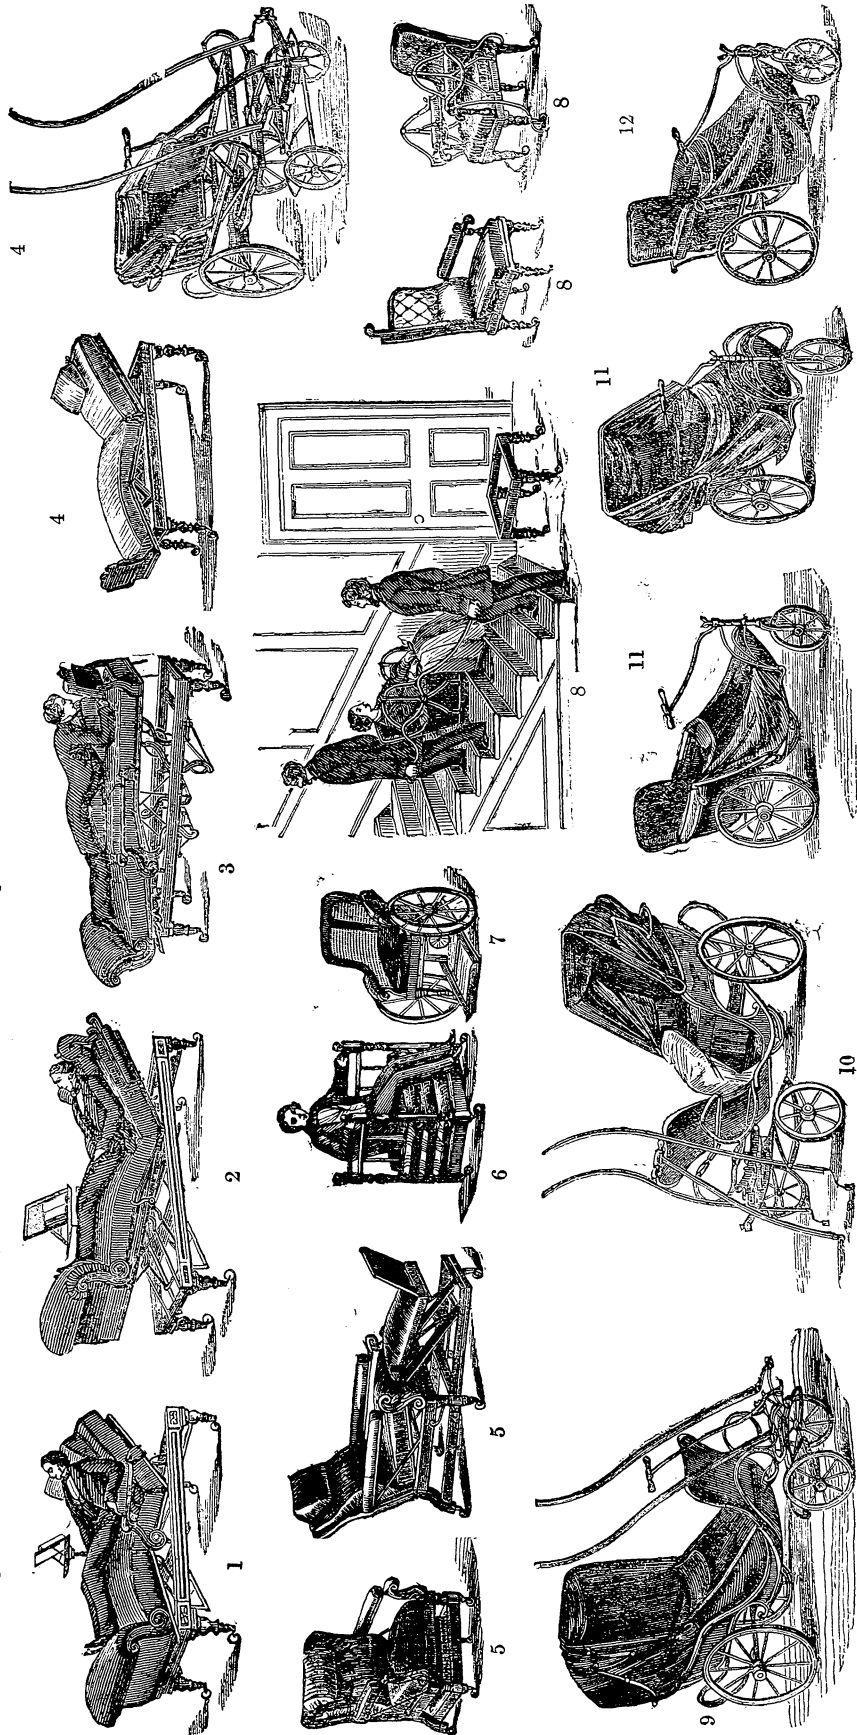

No. 7 is J. A.'s improved Self-propelling Chair, which renders an Invalid perfectly independent, being able to run from room to room without any assistance.

The chair always adjusting itself, enables the two persons who use it to walk up and down stairs with perfect ease and safety. It is also an easy chair for the room when the handles are off, and free from oscillation.

No. 10 is J. A.'s improved Four-wheel Albert Chair, fitted for hand or pony: the body being mounted upon C and under springs behind, and elliptic springs in front, which make it a most elegant and easy carriage.

No. 11, 11, is J. A.'s improved Three-wheel Albert Chair, with and without a head, which is as elegant and easy as can be made with three wheels.

No. 12 is J. A.'s improved Three-wheel Garden or Bath Chair, fitted with or without a head, and of the cheapest construction.

ORIGINAL LECTURES.

ON SUDDEN DEATH IN INFANCY
AND CHILDHOOD.

DELIVERED AT THE

Hospital for Sick Children,

Nov. 12, 1859,

By CHARLES WEST, M.D.

Physician to the Hospital for Sick Children.

INTRODUCTION.—TIME WHEN STUDY OF CHILDREN'S DISEASES IS LIKELY TO BE MOST USEFUL.—SUBJECT CHOSEN AS EXEMPLIFYING SOME OF THE PECULIARITIES OF EARLY LIFE.—SUDDEN DEATH IN THE YOUNG OFTEN INDEPENDENT OF SERIOUS ALTERATIONS OF STRUCTURE.—DEPENDENT ON SPASM OF RESPIRATORY ORGANS, AS IN SPASMODIC CROUP AND HOOPING-COUGH—ON MERE DISORDER OF RESPIRATION, AS IN COLLAPSE OF LUNG, OR IN PNEUMONIA, OR IN HYDROTHORAX.—DEATH FROM ASTHENIA—IN DIARRHŒA, IN PNEUMONIA, ETC.—RARITY OF SUDDEN DEATH FROM DISEASE OF THE BRAIN, AND WHY.—CONCLUSION.

GENTLEMEN,—The founders of the Children's Hospital proposed to themselves a three-fold object,—to relieve the sick; to train young women for the efficient discharge of the duties of children's nurses; and lastly, to promote a more accurate knowledge of the diseases of early life among Practitioners of Medicine, and especially among those who are about soon to enter on the active exercise of that Profession.

For the past seven years the first two of these objects have been to some extent accomplished: many a sick child has been restored to health within these walls, for the out-patients have amounted to 56,476, and the in-patients to 2211; while a few young women, though far fewer than we could wish, have received a training that will render them useful, helpful to themselves or to others, if sickness enters their home. Various difficulties, however, have hitherto prevented the fulfilment of the third, and certainly not the least important, of these purposes; and as a place for Medical instruction the Hospital for Sick Children has as yet done but little. The managers of the Institution, my colleagues, and myself, all feel that we must at least wipe away the reproach of not having attempted to accomplish what we yet profess most earnestly to desire; and accordingly it devolves on me to-day to commence a system of regular instruction in the peculiarities of nature, symptoms, and treatment of the diseases of early life.

I will not occupy your time in the attempt to prove that the diseases of childhood require a kind of study such as is not commonly bestowed on them by Students during their pupilage; such, indeed, I might say, as they rarely have the opportunity of bestowing. Our large Hospitals are still inadequate to meet the necessities of the adult population, and it is not the fault either of their managers, or of their medical officers, that children form in them but a very small minority of the patients who there present themselves to your observation. Nor, indeed, could this well be wished otherwise,—for the characters of disease are more easily read in the adult than in the child; and not till you can interpret the first with facility are you likely to decipher the hieroglyphics in which the latter are inscribed.

It is not, therefore, at the outset of your Medical studies, that a visit to the Children's Hospital is likely to yield you its full benefit; but, after you are acquainted with the general physiognomy of disease, it will profit you much to learn how its symptoms are modified, and its course is altered in early life; and how the dangers, against which it behoves you most to be on your guard, are not altogether the same in infancy and childhood as in adult age.

An exemplification of some of these peculiarities in early life will be furnished us if we inquire into the circumstances which commonly attend SUDDEN DEATH IN INFANCY AND CHILDHOOD.

A thorough investigation into this subject in all its bearings would imply most minute research into some of the most

difficult problems in physiology and pathology; a task for which I must own myself unequal, and one for which a single hour affords no sufficient time. But still, regarded even in its most obvious bearings, it must always be well worth the while of the Practitioner of Medicine to know when to be on the look out for sudden danger, or when, on the other hand, he may rest quiet in the certainty that, be the perils of a disease what they may, they will increase by but slow degrees, and ample warnings will precede their fatal issue.

The occurrence of sudden death in infancy derives part of its importance from the frequency with which it happens. It appears that out of 627 instances in which death took place suddenly within the London registration district in 1854, 236 were cases of infants under a year old. From that time, however, until with advancing years the processes of decay begin, sudden death is an accident of extreme rarity—so rare indeed that between the age of one and five years only thirty-six instances of its occurrence were met with; or not more than an eighth of the number stated to have happened in the first year of life. These statistics, however, do not by any means represent the subject in the full extent of its practical importance; for we are concerned, not with those cases only in which a state of apparent health is cut short by unexpected death; but also with those still more numerous instances in which disease, seemingly not grave, or at any rate apparently attended by no pressing danger, ends all at once in death.

When sudden death occurs in the aged, or in those in middle life, the anatomist is generally able to point to some definite cause of its occurrence: the cerebral vessels, rendered fragile by calcareous deposits in their coats, have suddenly given way, and allowed of the effusion of blood upon the brain; or an unsuspected aneurism has burst, or the heart's walls themselves, weakened by fatty degeneration, have torn; or some ulcer of the stomach or intestines has perforated the thin membrane, and the escape of the intestinal contents into the abdominal cavity has produced intense peritonitis, and speedy, if not immediate death. The machinery, in short, is found to have been at fault; its movements have ceased, as do those of the watch whose main-spring is broken. In childhood, however, we scrutinise the frame, a few moments since so full of life, now still for ever, and yet fail to discover why it has ceased to move: the cause which stopped it had done no irremediable damage, had left, perhaps, scarcely a trace of its effects; it was but momentary in its action, and could we set the machinery once more in movement, there seems no cause why it should not again perform its functions as harmoniously as before. Or, if we do find some flaw in its completeness, yet, even that is seldom such as time might not have remedied, still more seldom such as by its nature to give account of the suddenness with which all the processes of life were arrested.

A little boy, eight months old, had cut two teeth at six and a-half months, had always seemed well, save that now and then his hands were a little clenched, and his thumbs drawn into the palm. His bowels were slightly constipated; a small dose of castor-oil was given him. He swallowed it readily, but had scarcely done so when he stretched out his tongue, his face turned livid, but was scarcely at all distorted; he did not struggle, he uttered no cry—scarcely a sound passed from him, and he was dead!—dead with no trace of disease; from mere momentary spasm, which, for a few seconds, stopped his breath; which, had it ceased sooner, would have left no cloud upon his face, nor quelled for a quarter of an hour his cheerfulness.

I have related this case, not merely because it serves as a specimen of the way in which in early infancy life is not infrequently cut short without any trace of local mischief being discoverable; but because it illustrates the fact that it is by sudden interference with the respiratory process that such death is oftenest produced. The suddenly fatal apoplectic seizures which we observe in the adult, scarcely ever occur in early life, nor do we often meet, except in instances of congenital malformation, with sudden death dependent on disease of the heart. But in the course of all affections which seriously interfere with the process of respiration sudden death is a contingency for which we should always be prepared, and this especially in proportion as the disturbance of breathing partakes of a spasmodic character.

Now, of all the forms of spasmodic disorder of respiration, that to which the name of Spasmodic Croup, or Laryngismus Stridulus, has been given, is by far the most frequent; and to

it, probably, three out of four of the sudden deaths of children under one year old, are due. It is not that this ailment is generally fatal; for in proportion to the frequency of its occurrence, the mortality which arises from it is small; but it is that the fatal event is apt to be very sudden, which accounts for the anxiety wherewith its symptoms are watched by those who understand their import.

In early life, as you are aware, the excitability of the nervous system is far greater than in later years; and slight causes make a deeper impression, and produce a more profound disturbance, while the controlling power of the brain is smaller than it becomes in after-life. In infancy, too, the sources of irritation are especially numerous:—the branches of the trifacial nerve during the whole period of teething; the pneumo-gastric nerve, whenever, with a change of diet, food is taken that is not well assimilated; the spinal nerves, when intestinal disorder, or diarrhoea is produced, are so many centres, whose disturbance when once excited betrays itself in the thumbs drawn into the palm, in the somewhat hurried breathing, in the partially-closed larynx, and the peculiar crowing sound which that occasions with each inspiration, and which disturbance need increase but a little—but for a moment—to produce complete closure of the larynx, and sudden death. For days—for weeks, perhaps—these trivial symptoms may continue; and if I now insist on their importance, it is because they are often accompanied by but little disorder of the general health,—because they are seldom dependent on disease of the brain, or remediable by remedies directed towards it,—because they often are so slight that the anxiety of parents is hardly excited by them, and the watchfulness even of the doctor is apt to fall asleep. I do it also because the avoidance of the dangers they betoken, depends on the observance of a number of minute particulars which may seem scarcely worth the notice: because sudden noises, which startle,—a rapid change of temperature, which chills the surface, though only for a moment,—a rude awakening from sleep,—or even an over-hasty or an over-full meal, which interferes with the descent of the diaphragm,—any cause, in short, that deranges the regular rhythm of the respiratory movements, may give rise to spasm, and this spasm may prove suddenly fatal.

In the out-patients' room of this Hospital you will see many such cases; and it is no bad exercise to learn to notice and to interpret signs that would readily escape the eye of the unobservant; although they are the indications of a state of system in which, while the prospect of well-doing vastly preponderates, yet the chances of sudden death are never to be lost sight of.

In cases of this description, too, when once convulsions have occurred, a new element soon comes into play, which aggravates the danger and increases the frequency of the attack. The blood imperfectly depurated, if the disturbance of respiration has been considerable, seems in itself to exercise an injurious influence, by increasing the irritability of the nervous system, and thus promoting the return of the attack. If once convulsions have occurred, the probability of their recurrence is much increased; and the oftener they have happened, the more often are they likely to return, and the graver is the prognosis which you are compelled to form. This rule holds good, too, not with reference merely to spasmodic croup, but with reference to all spasmodic affections of the respiratory organs, and whooping-cough affords one of its best exemplifications. In some fit of coughing more violent than any of the others, the spasm of the larynx is of longer continuance, the face grows livid, a fruitless expiratory effort is made, and before the spasm relaxes a convulsion takes place. This convulsion is but very seldom a solitary one. You notice that for hours it is succeeded by very accelerated breathing; by which, however, the blood is very imperfectly depurated, as you see by the lips, which never resume their natural colour. At length the disturbance once more reaches its climax, and another, and then another convulsion occurs, with a gradually-diminishing interval, until death takes place. If, in such circumstances, you watch a child, you will notice how carefully it avoids every movement—how it remains in the same posture, occupied apparently altogether with the business of carrying on its respiration as gently and quietly as possible. Change its posture rapidly, excite it by sudden entrance into the room, disturb it by a violent emetic,—interfere, in short, in any way with the regular steady performance of its respiratory movements,—and

convulsions will come on, and in these convulsions death is likely to take place.

Some years ago I learnt this lesson in the case of a little boy, six years old, in whom whooping-cough set in with great oppression of the respiration, though that was out of proportion to the signs of local mischief detected on auscultation. I treated him with greater activity than I should now do, and gave him tartar-emetic, which failed, however, to reduce the frequency of his respiration, or to improve his condition. Still his state was one suggestive rather of anxiety for the future than of present danger. He was breathing carefully, anxiously, as though respiration were a function which required all his attention for its performance. Wishing to auscultate him, I had him lifted out of bed on to his mother's knee; but scarcely had he assumed the upright posture when a fit came on, in which he struggled much, his face became livid, almost purple; and though in less than three minutes the convulsion was over, it left him ashy pale, with a very feeble pulse, and perspiration streaming from every pore. He lived for thirty-six hours longer, but his respiration never resumed its natural frequency; a second fit occurred, six hours after the first; and then a third, which rendered his pulse still feebler. He lay now on his back, uttering a piteous moan, his face livid and miserable, his eyes dim, and though his pupils acted naturally, he yet complained that he "wanted more light." A fourth fit lasted several hours, and left him insensible; with the death-sweats on his face, and his eyes distorted, then came a fifth, which lasted for but a few minutes, when he died tranquilly.

There were here no morbid appearances in the brain, the lungs were extensively congested, and their lower lobes were in the first stage of pneumonia. The blood was imperfectly aerated; but, even so, while no demand was made for more adequate performance of the respiratory function, dangerous symptoms did not appear. The child's posture was suddenly altered, his circulation quickened, attempts at more frequent respiration in order to keep pace with the increased necessities of the system did but issue in an attack of spasm, and another, and still another, returned causelessly, till at length what we can scarcely call other than a *needless* death occurred.

There would be no difficulty, if time allowed, in multiplying illustrations; but it is scarcely necessary to do so, and we may sum up the chief conclusions, to which thus far we have been conducted, as follows:—

1. That sudden death in infancy and early childhood is most frequently dependent on spasmodic disturbance of the respiratory process.

2. That the occurrence of a single convulsion from such spasm renders it in the highest degree probable that others will follow it; and consequently implies a far greater risk of sudden death than exists so long as no such convulsion has taken place.

3. That when any spasmodic disorder of respiration is present, it is impossible to be too careful in avoiding any sudden impression on the nervous system, any sudden change of temperature, any hasty alteration of posture; in short, any cause whatever by which the respiratory process may be disturbed.

The next fact, to which I desire to call your attention, is the occasional occurrence of sudden death wholly independent of spasm, but in consequence of the sudden attack or extensive invasion of the respiratory organs by disease.

One of the simplest illustrations of this occurrence is met with in those instances in which the lung has been but imperfectly expanded at birth; the child in such circumstances lingering with lessening powers and increasing weakness, till life comes to an end after the lapse of a few hours, or days, or weeks. Such death is very often sudden, and not infrequently preceded by convulsion; and this, although nothing in the infant's condition a few hours previously, had indicated that it was less well, or that anything had diminished its chances of surviving its early difficulties.

Something of the same kind you may occasionally observe when—in the course of an attack of bronchitis or pneumonia—a large extent of lung has suddenly become collapsed, and the amount of breathing surface has thus been lessened considerably, and all at once. Such an accident is likely to happen in proportion to the tender age of the child, and its possibility is always to be borne in mind as governing your prognosis, and as suggesting an explanation of the otherwise inexplicable death of a patient. The frequent visits to a young infant

suffering from pneumonia, the often-repeated auscultation, the minute watching of little indications of its condition, have reference to such contingencies;—the attention to its posture, the keeping its chest somewhat elevated, the not allowing it to lie long on one side, but shifting it frequently from the one to the other,—are precautions prompted by a knowledge of the fact that collapse of the lung may take place suddenly, and that its sudden collapse may be followed by sudden death.

Now and then, though far more rarely, mere bronchitis or mere pneumonia is the occasion of sudden death in early life; and this sometimes even when neither the extent of tissue involved, nor the stage which the inflammation has reached, is adequate to account for the fatal issue of the case.

Just twenty years ago I saw a little boy aged one year and eight months, who was reported to have had a slight feverish attack for a few days before he came under my care. This still persisted, and on auscultating him a slight mucous *râle* was heard at the base of both lungs. At the end of four days he seemed a little better; at five p.m. he took some food with appetite, but at nine p.m. he suddenly became faint, seemed dying, and actually died at two o'clock in the morning. No explanation of this sudden death was furnished by the post-mortem examination, which discovered only that the lower lobes of both lungs were in the first stage of pneumonia.

In M. Louis' Memoir on Sudden Death, that distinguished physician, though treating of it in the adult, subjoins in a note (a) the history of a little girl four years old, who was suddenly seized by convulsions when apparently in perfect health on January 4. The convulsions were brought on apparently by a violent quarrel. She soon recovered from them, but was attacked thirty-six hours afterwards by shivering, followed by heat, cough, and pain in the left side where the auscultatory evidences of pneumonia were perceptible. She improved under treatment, and on January 11 was decidedly better. In the evening she was cheerful, sat up in bed and played with her toys as if she were well. At ten o'clock she went to sleep, woke and coughed at midnight and at three in the morning. On the latter occasion the cough soon ceased, and the child began talking to her mother, and complained that she had not stayed with her all the night. While uttering the word she died.

In this case it was thought that the right half of the cerebellum was somewhat less firm than the left; but the only condition which could be termed actually morbid, was presented by the lower lobe of the left lung, which was in a hepatized state for rather less than half of its extent.

I have related these cases in order to impress on your minds that the degree or extent of pulmonary inflammation is not an absolute measure of its danger in early life; but that sometimes death occurs suddenly as an indirect result of the interference with the respiratory process. I can only tell you the fact; I regret that I do not know of any criterion by which to distinguish the cases in which this sudden termination is most likely to happen.

Another class of cases in which disorder of respiration may be followed by sudden death comprises those instances where serous effusion takes place suddenly into the cavity of the pleuræ.

A little boy, not quite three years old, whose health had never been very robust, was brought as an out-patient to the Children's Dispensary in Lambeth on June 11, 1847, on account of a chronic impetiginous eruption on his scalp. On the night of June 12 he suddenly became hot, and his chest was much oppressed, but on the following day he was well enough to be out at play in the garden, and on the 15th was drawn a mile and a half in a perambulator to and from the Dispensary, when I saw him for the first time. He looked pale and ill, was feverish, and breathed with a wheezing noise; but there was nothing about him indicative of serious mischief; and in the hurry of prescribing for a large number of patients, I regarded him as probably a phthisical child, who had caught cold recently; I ordered some simple medicine for him, and at one p.m. he returned home. At three o'clock the same afternoon he suddenly became much worse, was very faint, breathed with extreme difficulty, and died at eight o'clock the next morning. Some serous fluid was present in the abdomen, and about 3vj. in either pleura, by which

the lower lobes of both lungs were so compressed as to be almost destitute of air; but there were no signs of inflammatory action, and no other morbid appearance.

In some of the cases death is far more sudden. A little boy, aged 8 years, was attacked by moderately severe scarlatina. Slight anasarca appeared on the 19th day, which had somewhat increased, but was accompanied by no urgent symptom, on the 22nd day, when he walked a distance of two miles without suffering serious fatigue. After a rather restless night, he rose to relieve his bowels, and there was so little suggestive of danger in his condition, that his mother left him for a few minutes alone. On her return, he seemed faint, the bowels having acted but scantily. He was replaced in bed, when he immediately began to struggle faintly, and in five minutes was dead.

The lungs were compressed by abundant serous effusion into each pleura, and the pericardium also contained four ounces of fluid; but there were no other morbid appearances, with the exception of some congestion of the kidneys.

In any case, then, of dropsical effusion in early life, it behoves you to bear in mind the possibility of its very rapid increase; of the outpouring of serum into the cavity of the chest so suddenly and with so little warning as to endanger or even to destroy life. Just, too, as I have warned you in other circumstances, that hurried movements, bringing with them sudden changes in the circulation, and sudden demands on the respiratory function, cannot be too carefully avoided; so, in these cases, is the same precaution pre-eminently necessary. If the child had not travelled in its perambulator in the one case, had not been allowed to get out of bed unaided in the other, death would probably not have occurred when it did—would possibly not have occurred at all.

It seems, then, contrary, to what were most probably your preconceived impressions, that sudden death in early life is most commonly due to some disturbance, direct or indirect, of the respiratory function; that either sudden spasm arrests it, or, disease having interfered with its perfect accomplishment, some sudden demand for its complete exercise issues in the sudden stand-still of the whole machinery. Neither, indeed, does disease of the brain itself stand next in importance among the causes of sudden death; but after these cases in which death may be said, in technical language, to take place from apnœa, come those in which it depends on asthenia; in which life goes out for want of nervous power to keep the vital functions in activity.

It is in this manner that sudden death is apt to occur in diarrhœa; it is thus, too, that it sometimes takes place in early infancy when over active treatment has been adopted for the cure of pneumonia or bronchitis; or when, independent even of over-treatment, the attention has been so engrossed by the disease that due care has not been taken to provide for the nourishment of the patient. This class of sudden deaths, though by no means rare, may be said to be almost needless, inasmuch as its occurrence may, by due foresight, be almost always guarded against. The accident is perhaps more likely to happen and more difficult to prevent in the course of diarrhœa than of most other disorders, since the infant is exhausted not merely by the abundant discharges, but also in many instances by the severe pain which accompanies them. The danger, too, is great in proportion to the tender age of the infant; and it is in relapses of diarrhœa that the hazard is most considerable, and the warnings which foreshadow it are the slightest. A return of the disorder of the bowels, which for some hours, or for one or two days, had seemed diminishing, has rekindled the apprehension of relatives: when, once again there comes a diminution of the previous apparent distress, a lessening of the restlessness, a quieting of the previous plaintive moan; and though the diarrhœa is not much diminished, yet at any rate the disorder of the bowels is not growing worse, and probably has at no time been so considerable as at its first onset. The apparent good is hailed with joy; the fact that this change may after all import evil, not good, is lost sight of; the little things which show their real meaning are not noticed, probably not observed, for they are nothing more than a slight dilatation of the pupils—so slight that in the darkened chamber it is not noticed; an apathy to external objects and sounds, which seems perhaps to be only the good result of the hushed stillness maintained around the darling's cot; a loss of the power of generating heat, which the tender officiousness of the mother renders

(a) Mémoires ou Recherches sur diverses Maladies, &c. Paris, 1826. P. 501, note.

almost imperceptible. Such, however, are often the only precursors—the harbingers, if you understood their mission, of the sudden collapse which, in an hour or two, is followed by a death as quiet often as a falling asleep.

Even these premonitions are not always seen, but when young infants are already much exhausted, the disturbance of the nervous system slight though we may fancy it which accompanies the action of the bowels may suffice to upset the whole balance of the functions. A slight convulsion, a sudden dilatation of the pupils, a momentary sigh, and all is still in death.

Should I do nothing more, I shall be well content to-day, if I can impress upon you how little things are to be noticed, little precautions to be observed, little dangers to be avoided in the diseases of infancy and childhood.

Though it is in the course of diarrhoea that the danger of sudden death from exhaustion is most to be watched against, yet your own experience will suggest to you many other circumstances in which you are likely to encounter it. You will meet with it in cases of pulmonary inflammation; the disorder of the respiratory function of itself disturbing the nervous system, and predisposing to the same occurrence which your active treatment (necessary perhaps at first, though now too long continued) tends in another way to produce.

I remember being called to see an infant three months old, who had had a slight attack of bronchitis complicating measles, for which it had been treated very judiciously by its medical attendant. The mischief in the chest was clearing up, the child was much better; anxiety was almost over; when suddenly the inspirations became again hurried, the pulse extremely rapid, the child took no notice, it seemed dying. The explanation of these symptoms, however, was not far to seek; the infant was at the breast, but its mother herself was ill, her secretion of milk scanty; her babe had but little power to suck, and got but little even of the small amount of nourishment which there was for her; in a few hours more her death all but suddenly would have taken place. A few drops of brandy revived her, a meal of ass's milk renewed her strength, and in a few hours the transition from imminent peril to perfect safety was complete.
